Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **SOIL**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Matrix Spikes (MS)

Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	83	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)							
Moisture Content	EA055	5	35	14.29	10.00	✓	NEPM 2013 B3 & ALS QC Standard
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	7	61	11.48	10.00	✓	NEPM 2013 B3 & ALS QC Standard
Laboratory Control Samples (LCS)							
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	4	61	6.56	5.00	✓	NEPM 2013 B3 & ALS QC Standard
Method Blanks (MB)

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. A portion of homogenised sample is extracted along with isotope dilution standards (where commercially available) in a solution of ammonium acetate in acetonitrile/methanol. Where relevant, interferences from co-extracted organics are removed using dispersive clean-up media (dSPE). A portion of extract is combined with an equal volume of reagent water and filtered for instrumental analysis.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	* ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
Solid Phase Extraction (SPE) for PFAS in water	* ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Receipt Detail	:	No. of samples received / analysed	: 114 / 113

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Please see scanned COC for sample discrepencies: extra samples , samples not received etc.
- Please direct any queries related to sample condition / numbering / breakages to Sample Receipt (Samples.Perth@alsglobal.com)
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Perth, NATA accreditation no. 825, site no. 15847.
- Please direct any turnaround / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **pH analysis should be conducted within 6 hours of sampling.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

No. of samples received	: 55		
No. of samples analysed	: 50		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Organic Supervisor	Perth Organics, Wangara, WA

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: High LCS recovery deemed acceptable as all associated analytes are <LOR.
- EP231X: LOR has been raised for particular analytes on certain samples due to matrix interference.
- Amendment (22/04/2025): This report has been amended as a result of a request to change sample identification numbers (IDs) received from Shenae Blakiston on 21/04/2025, for sample EP2504355-032. All analysis results are as per the previous report.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EP2504355**	Page	: 1 of 9
Amendment	: **1**		
Client	: **GHD PTY LTD**	Laboratory	: Environmental Division Perth
Contact	: [redacted]	Telephone	: +61-8-9406 1301
Project	: WA_0089_PFASOMP_25	Date Samples Received	: 24-Mar-2025
Site	: 0089	Issue Date	: 22-Apr-2025
Sampler	: [redacted]	No. of samples received	: 55
Order number	: 12641234/02.2.6	No. of samples analysed	: 50

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Matrix Spike outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Laboratory Control Spike (LCS) Recoveries							
EP231B: Perfluoroalkyl Carboxylic Acids	QC-6463938-002	---	**Perfluorodecanoic acid (PFDA)**	335-76-2	162 %	71.0-129%	**Recovery greater than upper control limit**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	59	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	59	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: ✗ = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction (SPE) followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. Isotope dilution standards (where commercially available) and surrogates are added to the sample container. The entire contents are transferred to a weak anion exchange (WAX) solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Data quality objectives for internal standard recoveries are based on US EPA method 1633.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	* ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Please see scanned COC for sample discrepencies: extra samples , samples not received etc.
- Please direct any queries related to sample condition / numbering / breakages to Sample Receipt (Samples.Perth@alsglobal.com)
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Perth, NATA accreditation no. 825, site no. 15847.
- Please direct any turnaround / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **pH analysis should be conducted within 6 hours of sampling.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
John Horwood	Organic Supervisor	Perth Organics, Wangara, WA

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

No. of samples analysed	: 10		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	13	7.69	10.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	* ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Please see scanned COC for sample discrepencies: extra samples , samples not received etc.
- Please direct any queries related to sample condition / numbering / breakages to Sample Receipt (Samples.Perth@alsglobal.com)
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Perth, NATA accreditation no. 825, site no. 15847.
- Please direct any turnaround / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **pH analysis should be conducted within 6 hours of sampling.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

List of acronyms

Acronym	Term
ADWG	Australian Drinking Water Guideline
AFFF	Aqueous film-forming foam
AHD	Australian Height Datum
ANZG	Australian and New Zealand Guidelines
AS/NZS	Australian Standards/ New Zealand Standards
AVCAT	Aviation Carrier Turbine
CoC	Chain of Custody
CSM	Conceptual Site Model
DCMM	Defence Contamination Management Manual
DO	Dissolved oxygen
DQI	Data Quality Indicator
DQO	Data Quality Objective
DWER	Department of Water and Environmental Regulation
EC	Electrical Conductivity
EPA	Environmental Protection Authority
ERA	Ecological Risk Assessment
HDPE	High-density Polyethylene
HEPA	Heads of EPA
HMAS	His Majesty's Australian Ship
LC	Lead Consultant
LCS	Laboratory control sample
LOR	Limit of reporting
MW	Monitoring Well
NATA	National Association of Testing Authorities
NEMP	National Environmental Management Plan 3.0
NEPM	National Environmental Protection Measure
NHMRC	National Health and Medical Research Council
OMP	Ongoing Monitoring Plan
OMR	Ongoing Monitoring Report
ORP	Oxidation reduction potential
PFAS	Per- and poly-fluoroalkyl substances
PFASIM	PFAS Investigation and Management
PFBS	Perfluorobutane sulfonic acid
PFHxS	Perfluorohexane sulfonic acid
PFOA	Perfluorooctanoic acid
PFOS	Perfluorooctane sulfonic acid
PMAP	PFAS Management Area Plan

Acronym	Term
QA/QC	Quality Assurance and Quality Control
RPD	Relative percentage difference
SAQP	Sampling Analysis and Quality Plan
SD	Sediment
SW	Surface Water
TDS	Total Dissolved Solids
WA	Western Australia
WWTP	Wastewater Treatment Plan

List of units

Units	Term
%	Percentage
°C	Degrees Celsius
µg/L	Micrograms per Litre
µS/cm	Micro Siemens per Centimetre
g	Grams
km	Kilometre
L	Litre
m	Metre
m bgl	Metres below ground level
mg/kg	Milligrams per Kilogram
mm	Millimetre
mV	Millivolt
pH	Potential of Hydrogen

1. Introduction

GHD Pty Ltd (GHD) has been engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) at His Majesty's Australian Ship (HMAS) Stirling (hereafter referred to as the 'base') in Western Australia (WA). The location of the base, the surrounding PFAS Management Area and key base features are shown in Figure 1 and Figure 2, Appendix A.

The OMP (Defence, 2019) and its associated Sampling Analysis and Quality Plan (SAQP) (GHD, 2025) outlines the rationale and scope for the monitoring of concentrations and extent of PFAS in groundwater, porewater, surface water, and sediment at the base and within the Management Area. Monitoring is undertaken on a quarterly basis including March, June, September and December sampling events. This Sampling Event Factual Report documents the results of the June 2025 Sampling Event.

1.1 Objectives

The key objectives of the OMP are to evaluate:

– The spatial and temporal (including seasonal) nature and extent of PFAS impact in the environment associated with site sources of PFAS derived from legacy use of aqueous film-forming foam (AFFF);
– Changes to the Conceptual Site Model (CSM), which describes the current understanding of PFAS sources, transport pathways and receptors;
– Whether current risks to human and ecological receptors require review;
– The influence that risk management activities at the base, as outlined in the PFAS Management Area Plan (PMAP) (Defence, 2019) have had on PFAS in the environment; and
– Whether any identified changes trigger an action and/or review.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PMAP.

1.2 Purpose of this report

This Sampling Event Factual Report has been prepared to document the results of the June 2025 sampling event, specifically highlighting first-time detections and/or new exceedances of relevant guideline values for perfluorooctane sulfonic acid (PFOS), perfluorohexane sulfonic acid (PFHxS), perfluorooctanoic acid (PFOA) and perfluorobutane sulfonic acid (PFBS).

An Ongoing Monitoring Report (OMR) will be prepared following the completion of each 12-month sampling period or as otherwise agreed.

This report has been prepared with reference to the Defence *Ongoing Monitoring Program Reporting Guidance* issued in February 2024 (Defence, 2024).

2. Scope of work

The scope of work was completed with reference to the OMP SAQP (GHD, 2025), as follows:

– Organise fieldwork and obtain approval for base access to monitoring locations.
– Collection of samples and water quality parameters from nominated locations (refer to Section 2.1).
– Collect and analyse samples for quality assurance and quality control (QA/QC).
– Analysis of samples for PFAS at the limit of reporting (LOR) nominated in the SAQP.
– Data management of the OMP field and laboratory data in the Defence ESdat database.
– Preparation of this Sampling Event Factual Report for the June 2025 sampling event.

2.1 Sampling locations

2.1.1 Groundwater

The groundwater monitoring locations are presented in Table 1 and are shown in Figure 3 to Figure 7 in Appendix A.

Table 1 OMP groundwater monitoring locations

Area	Monitoring Well ID
Fire Training Area	MW109, MW112, MW500, MW120, MW121, MW123, MW124, MW125, MW126, MW127 and MW128
Demolition Ground	MW139, MW141, MW142, MW147 and MW149
WWTP	MW158, MW161, MW166, MW171, MW173, MW193, MW195D, MW195S, MW196, MW199, MW200, MW202, MW203 and MW468
Helicopter Support Facility	MW214, MW215, MW216, MW217, MW220, MW224, MW225, MW226, MW227, MW228 and MW282
Accommodation Area	MW288 and MW289
Dredged Sediments	MW268 and MW269
AVCAT Storage and Fuel Farm	MW233, MW236, MW238, MW239, MW240, MW242, MW243, MW245, MW249, MW496 and MW516
Fire Station, Flammable / Hazardous Goods and Waste Storage, Ship Sullage	MW010, MW255, MW256, MW257, MW258, MW259 and MW553

2.1.2 Porewater, surface water and sediment monitoring locations

The porewater, surface water and sediment locations are presented in Table 2 and are shown in Figure 3 to Figure 7 in Appendix A.

Table 2 OMP porewaters, surface water and sediment monitoring locations

Area	Surface water sampling Location ID	Sediment Sampling Location ID	Porewater Sampling Location ID
Fire Training Areas	SW130, SW132, SW134	SD335, SD340, SD341, SD362, SD363, SD364	PW335, PW340, PW341, PW362, PW363, PW364
Demolition Ground	SW150, SW152, SW154, SW156	SD329, SD330, SD331, SD356, SD357, SD358	PW329, PW330, PW331, PW356, PW357, PW358
WWTP	SW305, SW353, SW370, SW371, SW372, SW373, SW382, SW383, SW384	SD304, SD345, SD350, SD351, SD352, SD367, SD368, SD369, SD380, SD381, SD401	PW304, PW345, PW350, PW351, PW352, PW367, PW368, PW369, PW380, PW381, PW401
Helicopter Support Facility	SW309, SW310, SW311, SW406, SW408, SW410, SW412, SW414, SW416	SD306, SD307, SD308, SD314, SD315, SD316, SD405, SD407, SD409, SD411, SD413, SD415	PW306, PW307, PW308, PW314, PW315, PW316, PW405, PW407, PW409, PW411, PW413, PW415
Accommodation Area	-	SD346	PW346
Dredged Sediments	SW317, SW318, SW319	SD374, SD375, SD378	PW374, PW375, PW378

2.2 SAQP deviations

The June 2025 sampling event was completed with reference to the OMP SAQP (GHD, 2025), GHD's health and safety protocols and GHD's standard operating procedures for field work, which have been developed in accordance with WA contaminated land guidance. Deviations from the OMP SAQP are summarised in Table 3.

Table 3 Summary of derivations from the OMP SAQP

Location	Deviation	Comments
MW196	Not sampled	Access to this monitoring location at in the WWTP source area requires a gate to be opened by base personnel. Base personnel were unavailable to open the gate at the time of the sampling event and therefore, the well was not sampled. **Minimal impact** – the range of PFAS concentrations at this well is well understood from historical data and are typically below the LOR. Base-wide groundwater contours were able to be inferred based on the wider monitoring network. Hydraulically down-gradient groundwater water location MW468 (i.e., closer to the receiving environment) was able to be sampled to provide an assessment of risks to the marine environment which is the primary sensitive receptor for the base.
MW239	Not sampled	Consistent with the March 2025 sampling event, this well, located in the AVCAT Storage and Fuel Farm source area, was found to be partially buried and the casing blocked with sand at the time of the sampling event. It was therefore unable to be sampled. **Minimal impact** – the range of PFAS concentrations at this well is well understood from historical data. Base-wide groundwater contours were able to be inferred based on the wider monitoring network. Hydraulically down-gradient groundwater water locations (i.e., closer to the receiving environment) including MW242, MW245, MW249. MW496 and MW516) were able to be sampled to provide an assessment of risks to the marine environment which is the primary sensitive receptor for the base.
PW314	Not sampled	Porewater location PW314, associated with the Helicopter Support Facility, was unable to be sampled due to installation of the piezometer encountering refusal at shallow depth on limestone, before water could be reached. An attempt to sample was made at 4 locations in the vicinity of the sampling location, though all encountered refusal. Refusal has been encountered at this location previously and may reflect tidal influence on the thickness of the sand layer overlying the limestone. **Minimal impact** – proximal locations PW306 to PW308, PW315 and PW316 were able to be sampled.

Location	Deviation	Comments
SD367 and PW367	Not sampled	This co-located sediment and porewater sampling location, associated with the WWTP source area, was unable to be sampled due to an excessive seaweed presence along the shoreline of the beach at the time of the sampling event, which prevented access to the underlying porewater and sediment. **Minimal impact** – proximal co-located locations SD/PW368 and SD/PW345 were able to be sampled. Location SD/PW367 was able to be sampled during the subsequent September 2025 sampling event (reported on separately).
PW350 to PW352, PW380, PW381 and PW401	Sampled using a bailer	These porewater sampling locations are only accessible by walking approximately 2 km along the beach. To minimise HSE risks associated with carrying heavy sampling equipment over this distance, porewater samples were collected from these locations using a bailer rather than a peristaltic pump. All other aspects of the sampling methodology were as outlined in Section 3.1.2. Minimal impact – with reference to Section 3.1.2, purging of porewater is not necessary due to the highly transmissive nature of the intertidal zone sediments. Recorded PFAS concentrations were consistent with historical data.

3. Methodology

3.1 Sampling methodology

The methodology for the June 2025 sampling event was completed with reference to the OMP SAQP (GHD, 2025) as outlined in the following sections.

3.1.1 Groundwater sampling

The groundwater sampling methodology is outlined in Table 4.

Table 4 Groundwater monitoring wells – sampling method

Activity	Details
Well Gauging	Monitoring wells were first gauged to allow subsequent correction of groundwater levels relative to Australian Height Datum (AHD) prior to groundwater sample collection. All depth measurements referenced the top of casing (TOC) of the monitoring well as an established datum.
Groundwater Physicochemical Parameters	Groundwater physiochemical parameters were recorded via a water quality meter from HydraSleeves® or purged water via peristaltic pump. The following parameters were recorded: – pH. – electrical conductivity (EC). – oxidation reduction potential (ORP). – Dissolved oxygen (DO). – Temperature. – Total Dissolved Solids (TDS). The water quality meter was calibrated by the equipment supplier. General observations regarding water quality (e.g., turbidity, colour etc.) or obvious indicators of contamination (e.g., sheens) were also recorded.
Deployment and Retrieval of HydraSleeves®	In compliance with section 18 of the Heads of EPA National Environmental Management Plan 3.0 (HEPA NEMP), groundwater samples were collected using bore-dedicated polypropylene HydraSleeves®. The HydraSleeves® were installed and left in place for a minimum of 24 hours prior to retrieving for sample collection. Where monitoring well construction details were available, the HydraSleeves® were positioned to target the approximate mid-section of the water column beneath the screened interval. Where construction details were not available, the HydraSleeves® were placed approximately 1 m from the base of the monitoring well (where sufficient depth of water was present within the well column). Samples were collected via continuous pull method at a rate allowing the water to pass through the check value into the sample sleeve. Samples were discharged immediately (to minimise changes in chemistry) via discharge tube. Following sampling, new HydraSleeves® were deployed in preparation for the next OMP monitoring event using the same string for consistency (same depth of sampling i.e. within screen depth). In the event that a monitoring well was found to contain a HydraSleeve® that belonged to another program, the HydraSleeve® was used for sampling (if it was in satisfactory condition) as outlined above, then replaced with a new HydraSleeve®. This did not occur during the June 2025 sampling event.
Alternative sampling methodology (low flow micro-purge)	In the event the water column wasn't sufficient to fill the HydraSleeve®, the HydraSleeve® was deployed with a top weight to compress the HydraSleeve® and left in wells for a minimum of 24 hours to allow restabilisation. This was not required during the June 2025 sampling event. If the HydraSleeve® was then retrieved with no or insufficient sample volume, low flow sampling occurred via a low flow micro-purge pump using the following methodology: – Post-gauging, each monitoring well was purged using a low flow micro-purge pump fitted with bore-dedicated inert silicone and High-density Polyethylene (HDPE) tubing. The upper end of the tubing was connected to the flow cell of a water quality meter positioned to prevent entrapment of oxygen.

Activity	Details
	– The pump intake was placed approximately 0.5 m below the top of screen (or at least 0.5 m below the top of the water column) to ensure collection of samples representative of groundwater quality beneath the base. – Measurement of water quality parameters was undertaken immediately after the flow cell was full and continued thereafter at two to five-minute intervals during the purging process. – Purging was undertaken until stabilisation of field parameters was achieved after which the well was subsequently sampled. Parameters were considered stable when they are within the following range (where practicable within the time constraints of the program): • Temperature: +/- 0.2 °C* • pH: +/- 0.05 • EC: +/- 3% • DO: +/- 10% • ORP: +/- 10 mV – Representative groundwater samples were collected directly from the HDPE tubing into laboratory supplied sample containers. During the June 2025 sampling event, the alternative sampling methodology was required at monitoring wells MW242 and MW282 **Note: The OMP SAQP (GHD, 2025) erroneously states variation in temperature should be +/- 0.02 °C rather than +/- 0.2 °C*
Field Records	Field records included the following information: – Gauging data – Sampling time and date. – Weather conditions. – Sample collection method. Where a HydraSleeve® is used for sample collection, the target interval depth was recorded. – Stabilised field parameters. – Observations regarding water quality (e.g., turbidity, colour etc.) or obvious indicators of contamination (e.g., sheens). – Sampling equipment decontamination procedures where non-disposable sampling equipment is utilised. – Calibration and daily bump test records. – Well gauging records. All sample documentation including field notes, reporting records, Chain of Custody (CoC) and equipment calibration certificates and procedures were retained within project files.
Decontamination procedure	Dedicated HydraSleeves® or HDPE tubing (in the event that a HydraSleeve® was not used) was used at each groundwater bore, thus removing the need for decontamination of these items. Single use nitrile gloves were worn during sampling and appropriately disposed of between each sampling location. All re-usable sampling equipment was thoroughly washed using PFAS and phosphate-free detergent (mixed per supplier instructions) then double rinsed with laboratory-supplied rinsate water before the sample collection.
Sample identification, preservation transport and holding times	Each sample bottle was pre-labelled by the laboratory with a unique barcode which was scanned into a mobile application to generate the CoC. Samples were collected directly in laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under CoC documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998).

3.1.2 Porewater sampling methodology

The methodology for porewater sampling is outlined in Table 5.

Table 5 Porewater sampling methodology

Item	Details
Porewater sample Collection	Sampling was conducted using a reusable stainless steel piezometer which has a screened zone consisting of a series of very fine interlaced machined slots to allow porewater to enter the sampler. The sampling end of the piezometer was inserted into the surficial marine sediments to approximately 0.5 m below the surface. Once the target sample depth was reached, porewater was collected using a peristaltic pump fitted with bore-dedicated silicone and HDPE tubing into laboratory supplied bottles. Field parameters were recorded (pH, EC, TDS, ORP, DO and temperature). Purging prior to sampling was not considered necessary due to the highly transmissive nature of the intertidal zone sediments. Field EC and/or TDS readings were used to assess whether the porewater sample is representative of discharging groundwater and not purely seawater.
Field records	Field records included the following information: – Sampling time and date. – Weather conditions. – Sample collection method. – Field parameters – Observations regarding water quality (e.g., turbidity, colour etc.) or obvious indicators of contamination (e.g., sheens). – Sampling equipment decontamination procedures where non-disposable sampling equipment is utilised. All sample documentation including field notes, reporting records, COC and equipment calibration certificates and procedures were retained within project files.
Decontamination	Single use nitrile gloves were worn during sampling and appropriately disposed of between each sampling location. Tubing was replaced at each sampling location. All re-usable sampling equipment was thoroughly washed using PFAS and phosphate-free detergent (mixed per supplier instructions) then double rinsed with laboratory-supplied rinsate water before the sample collection.

3.1.3 Surface water sampling methodology

The methodology for the surface water monitoring is detailed in Table 6.

Table 6 Surface Water Monitoring

Item	Details
Field parameters	Surface water physiochemical parameters (i.e. pH, EC, ORP, DO, and temperature) were recorded at the time of sampling using a pre-calibrated water quality meter. Field observations such as odours or sheen presence were also recorded on field sampling sheets.
Sampling Method	Where the embankment of the water body was stable and the water body could be safely accessed, surface water samples were collected by hand, directly into the laboratory supplied sample containers using a ‘grab’ (manual) sample method. Where depth permitted, the sample container was positioned at least 10 cm below the surface water level and above the sediment bed and oriented with the capped opening facing downwards to avoid the collection of surface films. Once in position, the container cap was removed to allow sample collection. Where sampling points cannot be safely accessed, surface water samples were collected using a long-handled sampler and decanted into the laboratory supplied sample containers. Samples were collected with reference to Australian/New Zealand Standards (AS/NZS 5667.1:1998) Water quality – Sampling – Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples.
Sample Collection	Water samples were placed directly into appropriately labelled, laboratory supplied sample bottles and packed in chilled containers for delivery to the laboratory under Chain of Custody documentation.

Item	Details
Decontamination	Single use nitrile gloves were worn during sampling and appropriately disposed of between each sampling location. All re-usable sampling equipment was thoroughly washed using PFAS and phosphate-free detergent (mixed per supplier instructions), then double rinsed with laboratory supplied rinsate water before the sample collection.
Sample identification, preservation, transport and holding times.	Each sample container was pre-labelled by the laboratory with a unique barcode which was scanned into a mobile application to generate the CoC. Samples were contained in laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under Chain of Custody documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998 as appropriate).
Field Records	Field records included the following information: – Sampling time, date and name of the sampler. – Weather conditions. – Sample collection method. – Field parameters – Observations regarding water quality (e.g. turbidity, colour etc.) or obvious indicators of contamination (e.g. sheens). – Depth of water body, flow rate and sample depth. – Sampling equipment decontamination procedures where non-disposable sampling equipment was utilised. – Calibration records. All sample documentation including field notes, reporting records, CoC and equipment calibration certificates and procedures were retained within project files.

3.1.4 Sediment sampling methodology

The methodology for sediment sampling is detailed in Table 7.

Table 7 Sediment Investigation Methodology

Item	Details
Sample Collection	Sediment samples were collected at the sediment/water interface using hand tools (e.g. trowel, hand auger, PVC pipe etc.) with samples placed directly into appropriately labelled, laboratory supplied sample containers and packed in chilled containers for delivery to the laboratory under Chain of Custody documentation. At each sampling location, the sediment sample will be visually assessed and observations (including physical description) recorded on field data sheets.
Field Records	Field records included the following information: – Sampling time, date and name of the sampler. – Sample description. – Weather conditions. – Sample collection method. – Observations regarding sediment quality (e.g., colour, grain size etc.) or obvious indicators of contamination (e.g., staining). – Sampling equipment decontamination procedures where non-disposable sampling equipment was utilised. All sample documentation including field notebooks, reporting records, CoC and equipment calibration certificates and procedures were retained within project files.
Decontamination	Single use nitrile gloves were worn during sampling and appropriately disposed of between each sampling location. All re-usable sampling equipment was thoroughly washed using PFAS and phosphate-free detergent (mixed per supplier instructions) then double rinsed with laboratory-supplied rinsate water before the sample collection.

3.2 Quality assurance and quality control

Quality assurance (QA) involves all the actions, procedures, checks and decisions, undertaken to ensure the representativeness and integrity of samples and accuracy and reliability of analytical results (NEPM, 2013). Quality control (QC) involves protocols to monitor and measure the effectiveness of QA procedures.

The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (GHD, 2025). A review of the field and laboratory QA/QC performance from the investigation is presented in the QA/QC data validation report, Appendix B. Key findings of the data validation report include:

– The majority of the calculated relative percentage difference (RPD) in concentrations for each duplicate pair, as presented in the tables in Appendix B were within acceptable limits. In most cases, RPD values greater than the acceptance criterion of 30% are considered reflective of the proximity of the reported concentrations to the LOR (i.e., less than 10 times the LOR) or are associated with concentrations that are within the same order of magnitude. On this basis, the RPDs greater than 30% are considered to have minimal impact on the data quality.
– Field blank analytical results were less than the LOR in all cases.
– Rinsate blank analytical results were less than the LOR in all cases.

Overall, the QA/QC assessment concluded that the collected data is considered appropriate for the work undertaken and are considered usable for the purpose of this assessment.

All data collected during this event has been reviewed and uploaded to the Defence ESdat database in accordance with Defence Contamination Management Manual (DCMM) requirements (Defence, 2021).

4. Guideline values

A summary of the current PFAS guideline values for groundwater, porewater and surface water considered relevant to the base is presented as Table 8. The guideline values are largely based upon:

– The PFAS NEMP (HEPA, 2025) which presents a consolidated set of health- and ecology-based Australian PFAS assessment levels for soil and water that are derived from various guidelines and publications. It is noted that the aquatic ecosystems guideline value for PFOS is lower than the standard LOR that was applied at the porewater and surface water monitoring locations.

– The National Health and Medical Research Council (NHMRC) Australian Drinking Water Guidelines (ADWGs) for PFAS that were published on 25 June 2025 (NHMRC, 2025), after the June 2025 sampling event. It is noted that the ADWG value for PFOS is less than the standard PFAS LOR that was applied at the groundwater monitoring locations.

– The Australian and New Zealand Guidelines (ANZG) for PFOS in freshwater, which were released in March 2026, after the sampling event (ANZG, 2026). In relation to this guideline:

  - The relevant freshwater PFOS value has applied for the marine water data in the Management Area on the basis outlined in the PFAS NEMP whereby freshwater values are nominated as interim marine values in the absence of sufficient data to derive values specific to marine environments.
  - The screening threshold (i.e., 0.0005 µg/L) for triggering assessment of PFOS concentrations in biota has not been considered on the basis that an ERA (RPS, 2018b) has been completed that included measurement of PFAS concentrations in lower trophic level aquatic biota, estimation of PFOS concentrations in fish and shorebirds, and food web modelling to understand risks posed to higher order consumers through bioaccumulation.

It is noted that there is currently no Australian regulatory endorsed screening criteria for risk posed to ecology or human health by PFAS in sediment.

Table 8 Relevant PFAS assessment guideline values

Exposure scenario	Source	Assessment guideline value (µg/L)				
		PFOS	PFHxS	PFOS+ PFHxS	PFOA	PFBS
Groundwater						
Health: potable use of groundwater	NHMRC (2025)	0.008	0.03	-	0.2	1
Porewater and surface water						
Health: Recreational water use	PFAS NEMP	2	2	2	10	-
Ecology: aquatic ecosystems (99% species protection)	PFAS NEMP / ANZG (2026)	0.02	-	-	19	-

It is important to note that an Ecological Risk Assessment (ERA) (RPS, 2018b) has been completed for the base to assess the potential risks to the environment associated with presence of PFAS within the Management Area. While the OMP evaluates PFAS concentration data with reference to the ecology-based screening criteria identified in Table 8, decision-making concerning changes to risks posed to ecological receptors within the Management Area should continue to be made with reference to the ERA conclusions and the dataset that informed it.

5. Field observations and results

5.1 General observations

The sampling event was completed over ten days between 3 and 16 June 2025. The weather conditions and general observations (including activities that may impact the monitoring program) recorded during the sampling event are summarised in Table 9.

Table 9 General Observations

Items	Observations
Weather Conditions	The weather during the sampling event comprised temperatures of between 18.9 ˚C (11 June) and 22.8 ˚C (3 June). Rainfall occurred on 8 of the 10 days. The greatest volume of rainfall was 16 mm on 4 June 2025. Information obtained from Garden Island HSF (Station ID 009256) (Bureau of Meteorology, 2025)
Estate Management Works, Training Activities and/or Construction Works.	Construction of a new building was underway adjacent to the west side of the AVCAT Storage Facility source area. GHD understands these works were unrelated to the PMAP.

5.2 Field observations and measurements

The observations and measurements recorded during the field activities for the June 2025 quarterly sampling event are summarised in Table 10. Field notes are presented in Appendix F.

Table 10 Summary of field observations and measurements

Item	Description
Access and sample collection	Most sampling locations were accessible and able to be sampled. Some groundwater locations were unable to be sampled due to being blocked or inaccessible and one porewater location was not sampled due to refusal (refer to Table 3). Consistent with the March 2025 sampling event, the measured well depth in some monitoring wells (i.e., MW121, MW123, MW139, MW142, MW166, MW193, MW195D, MW249, MW256, MW257, MW282, MW289, MW468, MW500, MW553), when compared to the constructed well depth, suggests sediment may have accumulated within the monitoring wells (refer to Table C1, Appendix C). The wells were still able to be sampled.
Water and sediment observations	Groundwater was predominantly clear, colourless to pale yellow with low turbidity, low to moderate sediment load and no odour or sheen. An organic odour was noted at MW126, MW158, MW199 and MW220. A hydrocarbon odour was noted at MW214, MW215, MW227, MW245, MW249, MW496, MW516, MW553, Porewater was predominantly clear and colourless with low to moderate sediment load and no odour or sheen. Surface water was predominantly clear and colourless with no sheen or odour. Sediment was mostly moist to saturated, pale yellow to light brown/grey, fine to medium grained beach sand. Locations with large seaweed deposits on the beach were found to have organic matter (i.e., decaying seaweed) present within the sediment samples.
Groundwater flow direction	The calculated groundwater elevations (m AHD) are presented in Table C1 in Appendix C. Groundwater elevations across the base at the time of the sampling event ranged from 0.305 (MW124) to 1.609 m AHD (MW233), which is comparable with the historical range. Inferred groundwater contours are presented in Figure 3 to Figure 7 in Appendix A. Groundwater flow direction across the base at the time of the sampling event is summarised below. Generally, groundwater flow was towards the coast, with inward flow and mounding in some areas, likely as a result of tidal influence, which is consistent with previous findings. **Fire Training Area** Generally easterly towards the Cockburn Sound. Some potential mounding is evident to the south of MW112, which is broadly consistent with previous gauging rounds.

Item	Description
	Demolition Ground North-westerly (i.e., inward) groundwater flow, possibly associated with tidal influence from the adjoining Cockburn Sound, consistent with previous gauging rounds. **Wastewater Treatment Plant** Generally north-easterly flow towards the Cockburn Sound. **Helicopter Support Facility** Generally westerly towards the Cockburn Sound. **Main base area** Generally southerly towards the Cockburn Sound.
Geochemical parameters	Water geochemical parameters were measured during the collection of water samples. The readings are presented in Tables C1, C2 and C3 in Appendix C and are summarised below: **Groundwater** – Temperature ranged from 18.1 ˚C (MW149) to 24.2 ˚C (MW242) – pH ranged from 6.67 (MW139) to 9.01 (MW240) indicating slightly acidic to alkaline conditions. – EC ranged from 308.1 µS/cm (MW233) to 63,112 µS/cm (MW127) indicating fresh to saline conditions. – TDS ranged from 203.5 mg/L (MW233) to 33,387 mg/L (MW149) indicating fresh to saline conditions. – DO ranged from 0.95 mg/L (MW255) to 27.3 mg/L (MW120) indicating poor to well oxygenated conditions*. – Redox ranged from -635.2 mV (MW173) to 117.3 mV (MW258) indicating both reducing and oxidising conditions. **Porewater** – Temperature ranged from 15.8 ˚C (PW405) to 21.4 ˚C (PW352). – pH ranged from 7.13 (PW369) to 9.72 (PW356) indicating circum-neutral to alkaline conditions. – EC ranged from 16,653 µS/cm (PW346) to 57,163 µS/cm (PW329) indicating brackish to saline conditions. – TDS ranged from 10,803 mg/L (PW346) to 36,258 mg/L (PW350) indicating saline conditions. – DO ranged from 6.66 mg/L (PW346) to 15.6 mg/L (PW329) indicating moderate to well oxygenated conditions*. – Redox ranged from -461.9 mV (PW375) to -50.2 mV (PW401) indicating reducing conditions. **Surface water** – Temperature ranged from 17.5 ˚C (SW319) to 21.9 ˚C (SW383). – pH ranged from 7.74 (SW130) to 8.88 (SW150) indicating slightly alkaline to alkaline conditions. – EC ranged from 29,658 µS/cm (SW309) to 54,158 µS/cm (SW383) indicating saline conditions. – TDS (where recorded) ranged from 34,341 mg/L (SW372) to 35,379 mg/L (SW382) indicating saline conditions. – DO ranged from 8.75 mg/L (SW310) to 15.6 mg/L (SW383) indicating well oxygenated conditions*. – Redox ranged from -469.5 mV (SW318) to 346.2 mV (SW371) indicating both reducing and oxidising conditions. *It is noted that DO concentrations recorded during the monitoring event were generally elevated with respect to recent data (i.e., greater than the maximum concentrations of 9.55, 9.95 and 6.95 mg/L in groundwater, porewater and surface water respectively, recorded between June 2022 and March 2025). This could represent a fault with the YSI, although the supplier's calibration certificate indicated acceptable calibration and condition of the unit at commencement of fieldwork (refer to Appendix D).

5.3 Summary of analytical results

The PFAS analytical results for groundwater, surface water, sediment and porewater from this sampling event are presented in Table C4 to C7 in Appendix C and are summarised in Figure 8 to Figure 13 in Appendix A..

5.3.1 Groundwater

60 primary groundwater samples were analysed for PFAS, with:

– 24 samples reporting **PFBS** concentrations above the LOR. Four of these were above the ADWG value (1 µg/L) namely, MW256 (1.65 µg/L), MW258 (5.04 µg/L), MW282 (2.43 µg/L) and MW171 (1.61 µg/L).
– 44 samples reporting **PFOS** concentrations above the LOR. All of these reported concentrations above the ADWG value (0.008 µg/L), noting that the LOR that was applied is greater than the ADWG value. 16 samples reported PFOS concentrations below the LOR (i.e., <0.01) and it therefore cannot be determined whether PFOS concentrations in these samples were above or below the ADWG value.
– 46 samples reporting **PFHxS** concentrations above the LOR. Of these, 37 samples reported concentrations greater than the ADWG value (0.03 µg/L).
– 29 samples reporting **PFOA** concentrations above the LOR. Of these, 12 samples reported concentrations greater than the ADWG value (0.2 µg/L).

A summary of groundwater locations where concentrations were greater than those previously reported (i.e., first-time detections or new maximums) is presented as Table 11.

Table 11 Deviations from historical dataset – groundwater analytical results

Item	Sample location	PFBS (µg/L)		PFHxS (µg/L)		PFOA (µg/L)		PFOS (µg/L)	
		June 2025	Previous Max.	June 2025	Previous Max.	June 2025	Previous Max.	June 2025	Previous Max.
First-time detection	None	No first-time detections							
New historical maximum	MW121	2.5*	0.64	No new maximum		No new maximum		No new maximum	
	MW171	No new maximum		7.26	6.95	0.41	0.39	2.73	2.65
	MW215	0.57	0.16	2.62	1.22	0.08	0.03	No new maximum	
	MW228	0.46	0.38	No new maximum		No new maximum		0.03	0.004
	MW268	No new maximum		0.85	0.82	0.01	0.003	No new maximum	
	MW289	0.13	0.12	No new maximum		No new maximum		No new maximum	
*Split duplicate sample result									

5.3.2 Porewater

In summary, 37 primary porewater samples were analysed for PFAS, with:

– Six samples reporting a **PFOS** concentration above the LOR. One of these (PW401) reported a concentration equal to the aquatic ecosystems value (0.02 µg/L) and three (PW346, PW350 and PW368) reported concentrations greater than this value.
– One sample (PW346) reporting a **PFHxS** concentration above the LOR. The concentration was less than the recreational guideline value (2 µg/L).
– Six samples reporting a **PFOS+PFHxS** concentration above the LOR. All reported concentrations were less than the recreational guideline value (2 µg/L).
– One sample (PW346) reporting a **PFOA** concentration above the LOR. The reported concentration was less than the aquatic ecosystems guideline value (19 µg/L) and the recreational guideline value (10 µg/L).

There were no first-time detections or new maximum PFAS concentrations in porewater samples.

5.3.3 Surface water

28 primary surface water samples were analysed for PFAS. All PFAS were reported at concentrations below the LOR and therefore, there were no first-time detections or new maximum PFAS concentrations in surface water samples.

5.3.4 Sediment

38 primary sediment samples were analysed for PFAS compounds, with:

– No samples reporting a **PFBS** concentration above the LOR.
– Two samples reporting a **PFOS** concentration above the LOR. This included SD346, associated with the accommodation area, with a concentration of 0.0009 mg/kg and SD350, associated with the WWTP, with a concentration of 0.0003 mg/kg.
– Two samples reporting a **PFHxS+PFOS** concentration above the LOR, with concentrations equal to the PFOS concentrations outlined above (i.e., all samples comprised PFOS only).
– No samples reporting a **PFHxS** concentration above the LOR.
– No samples reporting a **PFOA** concentration above the LOR.

There were no first-time detections or new maximum PFAS concentrations in sediment samples.

6. Summary

The findings and recommended actions from the June 2025 sampling event are summarised in Table 12.

Table 12 Summary of sampling event

Item	Comment	Recommended Action
Access to sampling locations	All locations were accessible apart from MW196 at the WWTP source area (refer to Section 2.2).	Locations hydraulically down-gradient of MW196 (i.e., closer to the receiving environment) were able to be sampled to provide an assessment of risks to the marine environment, which is the primary sensitive receptor for the base. Subsequent monitoring events will seek to obtain access to MW196 via base personnel. The well was sampled during the subsequent September 2025 event (reported on separately).
Location unable to be sampled, inaccessible or dry	With reference to Section 2.2, porewater location PW413 was unable to be sampled due to encountered refusal on limestone, while co-located porewater and sediment sampling location SD/PW367 was unable to be sampled due to the presence of excessive seaweed on the shoreline of the beach. Consistent with the previous March 2025 sampling event, MW239 in the AVCAT Storage and Fuel Farm was blocked and unable to be sampled. As noted in Section 5.1, the measured well depth in some monitoring wells suggests sediment may have accumulated within the monitoring wells. The wells were still able to be sampled and the recorded PFAS concentrations were within the historical range.	In both cases, proximal porewater and sediment monitoring locations were able to be sampled to provide an indication of any change in PFAS concentrations and associated exposure risks at the point of groundwater discharge to the marine environment. The locations were able be sampled as part of the subsequent September 2025 sampling event (reported on separately). Replacement/repair of MW239 and wells with accumulated sediment is not recommended as a matter of priority at this time. The forthcoming OMP Revision will review the value of the monitoring well in the context of the OMP objectives and make a recommendation for repair, re-installation or otherwise.
Analytical results	60 groundwater samples, 37 porewater samples, 28 surface water samples and 38 sediment samples were analysed. Concentrations recorded were generally consistent with historical data.	Locations will be sampled again during the next OMP sampling event. Data will be evaluated further within the context of the OMP objectives (refer to Section 1.1) as part of the forthcoming OMR. The requirement to apply a non-standard LOR at selected monitoring locations to inform a suitable risk assessment will be considered as part of the OMR and forthcoming OMP Revision process.
First-time detections of PFBS, PFHxS, PFOA and/or PFOS	No first-time detections were identified during the June 2025 sampling event.	
New historical maximum concentrations	New historical maximum concentrations were reported at groundwater monitoring locations MW121 (in the Fire Training Area), MW171 (associated with the WWTP), MW215, MW228 (both in the Helicopter Support Facility), MW268 (in the Dredged Sediments source area) and MW289 (in the Accommodation Area). In all cases, the new maximum concentrations were within one order of magnitude of the previous maximum concentrations.	
New exceedance of human health guideline value	Numerous groundwater monitoring locations recorded PFAS concentrations in excess of the revised ADWGs that were released in June 2025, after the sampling event. It is noted that the standard LOR that was applied (i.e., 0.01 µg/L) exceeds the revised ADWG for PFOS (0.008 µg/L). GHD understands that groundwater is not abstracted on the base for potable or non-potable	

	use. Potable water for Garden Island is supplied from the Rockingham town water supply (GHD, 2025).	
New exceedance of adopted guideline values?	No surface water or porewater locations reported new exceedances of the adopted ecological guideline values for PFOS and/or PFOA.

8. Limitations

This report has been prepared by GHD for Department of Defence and may only be used and relied on by Department of Defence for the purpose agreed between GHD and Department of Defence as set out in Section 1.2 of this report.

GHD otherwise disclaims responsibility to any person other than Department of Defence arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally permissible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

The opinions, conclusions and any recommendations in this report are based on conditions encountered and information reviewed at the date of preparation of the report. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date that the report was prepared.

The opinions, conclusions and any recommendations in this report are based on information obtained from, and testing undertaken at or in connection with, specific sample points. Site conditions at other parts of the site may be different from the site conditions found at the specific sample points.

Investigations undertaken in respect of this report are constrained by the particular site conditions, such as the location of buildings, services and vegetation. As a result, not all relevant site features and conditions may have been identified in this report.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described in this report. GHD disclaims liability arising from any of the assumptions being incorrect.

GHD has prepared this report on the basis of information provided by Department of Defence and others who provided information to GHD (including Government authorities)], which GHD has not independently verified or checked beyond the agreed scope of work. GHD does not accept liability in connection with such unverified information, including errors and omissions in the report which were caused by errors or omissions in that information.

Appendix B

Data validation

Appendix B

HMAS Stirling – June 2025 QA/QC Evaluation

The QA and QC procedures were undertaken in accordance with the ASC NEPM and the *Assessment and management of contaminated sites* (DWER 2021).

QA involves all the actions, procedures, checks and decisions undertaken to ensure the representativeness and integrity of samples and the accuracy and reliability of analytical results (NEPC 2013). QC involves protocols to monitor and measure the effectiveness of QA procedures.

B-1 Fieldwork Program

Field QA/QC procedures and compliance during the investigation are summarised in Table 1 below, with exceptions detailed in the following subsections.

Table 1 Summary of fieldwork QA/QC compliance

QA/QC element	Requirement	Requirement adhered to?	Information / data acceptable
Sampling methods	All sampling methods outlined in the HMAS Stirling OMP SAQP (GHD 2025) were adhered to.	Yes	Yes
Recording keeping	Detailed records of field activities were maintained with the use of electronic or paper field sheets and quality control sample registers.	Yes	Yes, see Appendix F
CoC documentation	The CoC documentation was completed for each batch of samples, identifying the names of the samplers, the type of sample, the collection date, the analyses to be performed, sample preservation methods, and time the samples were relinquished to the courier.	Yes	Yes, see Appendix E
Sample labelling	Samples were properly labelled, showing reference number, sample ID, date of collection, sampler name and preservation techniques.	Yes	Yes
Sample containers	Samples were collected in appropriate laboratory supplied containers with suitable preservation methods (where required).	Yes	Yes
Sample storage and transport	Samples were stored in a chilled esky immediately after sampling prior to submission to the laboratory. Samples were kept in a chilled esky during delivery with CoC documentation. Samples were received at the laboratory at the recommended temperature (4 °C).	Yes, with exceptions	Yes, see Section B-1.1.
Decontamination	Reusable field equipment (e.g. interface meter) were appropriately decontaminated using Liquinox between each sampling location.	Yes	Yes
Rinsate blanks	Rinsate samples were collected by the sampler on each day following decontamination of reusable sampling equipment. Analysis of rinsate blanks reported concentrations below laboratory LOR	Yes	Yes, see Section B-1.2.

QA/QC element	Requirement	Requirement adhered to?	Information / data acceptable
	indicating equipment was decontaminated appropriately.		
Field blanks	Field blanks were collected by the sampler on each day to estimate potential contamination of a sample during the collection procedure. Analysis of field blanks reported concentrations below laboratory LOR indicating no cross contamination occurred as a result of ambient conditions during sampling.	Yes	Yes, see Section B-1.2.
Duplicate blanks	Blind and split duplicate samples were collected for analysis by the primary and secondary laboratories, respectively (at a frequency of at least one pair per 10 primary samples). RPDs calculated for the duplicate samples were at or below 30%.	Yes, with exceptions	Yes, see Section B-1.3.

B-1.1 Sample containers, storage, and transport

All samples were collected in appropriate laboratory supplied containers with suitable preservation methods (where applicable).

To aid sample integrity, all samples were promptly placed into a chilled esky (with double bagged ice) following the completion of sampling. Eskies were delivered to the primary laboratory (ALS Environmental) and secondary laboratory (Eurofins) as soon as practicable via courier.

As summarised in Table 2, the sample receipts noted the Eurofins sample was higher than the recommended temperature (4 °C). However, the receipt also noted evidence of an attempt to keep the samples chilled and therefore it is considered that reasonable attempt to maintain the recommended sample temperature was made.

Table 2 Summary of sample receipt temperatures

Lab report number	Temperature (°C)	Earliest Sample Date	Lab Received Date	Comments
EP2509632	3.6	03/06/25	18/06/2025	“Ice present”
1233380	8.0	03/06/25	17/06/2025	“Attempt to chill was evident”

B-1.2 Quality assurance – blank samples

The groundwater QA samples collected during this sampling event were:

– **Rinsate blanks**: Rinsate blank samples are water samples collected from decontaminated, reused field equipment and were used primarily to assess whether the decontamination procedure was effective and if cross contamination has led to positive observations in subsequent samples. Rinsate samples were collected by pouring laboratory supplied rinsate water over reusable sampling equipment (e.g. interface probe) and collecting it in laboratory supplied containers. Rinsate samples were then transferred to a chilled cooler for sample preservation prior to and during transport to the testing laboratory.

– **Field blanks**: Field blank samples were used to estimate contamination of a sample during the collection procedure. Field blank samples were collected by pouring laboratory supplied rinsate water into laboratory supplied bottles onsite and sent to the laboratory for analysis along with other samples.

The blank samples collected and analysed as part of the quality assurance program are summarised in Table 3 . All analyte concentrations for the transport, field, and rinsate blanks were below the laboratory LOR. The tabulated blank sample results are shown in Table QC.1 in Attachment 1.

Table 3 Summary of rinsate, field and transport blanks

Lab report number	Sample type	Sample ID	Below LOR
EP2509632	Rinsate Blank	0089_QC300_250603	Yes
		0089_QC301_250604

		0089_QC406_250611	
		0089_QC407_250612	
		0089_QC408_250613	
		0089_QC409_250616	

B-1.3 Quality control – duplicate samples

The QC samples collected during the investigation were:

– **Blind duplicates**: Blind duplicate samples were used to identify the variation in the analyte concentration between samples from the same sampling point and the repeatability of the laboratory's analysis.
– **Split duplicates**: Split duplicate samples were used to provide an indication of the repeatability of the results between laboratories.

Field duplicate samples (blind and split) were collected in replicate bottles during sampling. The required analyses were performed by ALS Laboratory group (primary laboratory) and Eurofins (secondary laboratory), both of whom are NATA accredited.

B-1.3.1 Sample collection frequency

Based on the OMP (GHD 2019), one pair of duplicates (blind and split) was required to be collected and analysed per 10 primary PFAS samples. The frequency of groundwater duplicates collected for this assessment is summarised in Table 4.

Table 4 Duplicate sampling frequency summary

Matrix	Rate	Expected number of duplicate pairs	Number of blind duplicate samples collected	Number of split duplicate samples collected
Water	1 duplicate pair per 10 primary samples	13 (125 primary samples)	13	13

Matrix	Rate	Expected number of duplicate pairs	Number of blind duplicate samples collected	Number of split duplicate samples collected
Sediment	1 duplicate pair per 10 primary samples	4 (38 primary samples)	4	4

B-1.3.2 Relative percentage difference calculations

RPD calculations are used to assess how closely primary, blind duplicate and split duplicate sample results match. RPDs are a quantitative measure of the accuracy of the analytical results and are calculated in accordance with the procedure described in AS 4482.1 – 2005 (Standards Australia 2005). According to AS 4482.1 – 2005, typical RPDs are expected to range between 30% and 50%; however, this may be higher for organics and for low concentrations of analytes.

RPD results were considered acceptable if they were less than or equal to 30%. The only exception to this was when concentrations within the primary and blind or split sample were less than ten times the laboratory LOR. In this case, a greater RPD value is considered acceptable.

Where a result is reported below the laboratory LOR for one of the paired samples, the sample was assigned a concentration equal to the LOR for RPD calculation purposes. This is based on the consideration that the chemical may be present at a concentration just below the laboratory LOR or not present at all (i.e. the concentration is zero). Where both results are reported below laboratory LOR, the RPD is not calculated.

Water RPDs

For the water monitoring (including groundwater, surface water and potable water), a total of 990 RPDs were calculated, and 38 RPDs (i.e., 3.83%) exceeded the adopted (conservative) 30% RPD acceptable limit, where the primary and/or duplicate sample concentrations were greater than ten times the laboratory LOR. 879 RPDs were expressed as zero as both the primary and duplicate/split sample concentrations were less than the laboratory LOR. A summary of these exceedances is detailed in Table 5 and full calculations are provided in the attached Table QC.2.

The RPD values greater than the adopted threshold of 30% (where the primary and/or duplicate sample concentrations were greater than 10 times the applied LOR) are considered to have limited impact on the overall data quality given the low proportion of outliers relative to the wider dataset and noting that in these cases, the reported concentrations were within generally the same order of magnitude.

Table 5 Summary of water RPD exceedances

Primary & Duplicate Field IDs (Type)	Analyte	RPD	Primary Concentration	Duplicate Concentration	Concentrations within 10 x LOR?
0089_MW269_250603 / 0089_QC201_250603	Perfluorobutane sulfonic acid (PFBS)	33%	0.05 µg/L	0.07 µg/L	Yes
	Perfluorooctane sulfonic acid (PFOS)	34%	0.36 µg/L	0.51 µg/L	No
	Perfluoropentane sulfonic acid (PFPeS)	33%	0.05 µg/L	0.07 µg/L	Yes
	Perfluorohexane sulfonic acid (PFHxS)	32%	0.52 µg/L	0.72 µg/L	No
	PFAS (Sum of Total)	34%	1.12 µg/L	1.58 µg/L	No
	PFAS (Sum of Total)(WA DER List	32%	1.07 µg/L	1.48 µg/L	No
	Sum of PFHxS and PFOS	33%	0.88 µg/L	1.23 µg/L	No
0089_MW010_250603 /	Perfluorohexane sulfonic acid (PFHxS)	33%	0.05 µg/L	0.07 µg/L	Yes

Primary & Duplicate Field IDs (Type)	Analyte	RPD	Primary Concentration	Duplicate Concentration	Concentrations within 10 x LOR?
0089_QC200_250603	PFAS (Sum of Total)(WA DER List)	46%	0.05 µg/L	0.08 µg/L	Yes
	Sum of PFHxS and PFOS	46%	0.05 µg/L	0.08 µg/L	Yes
0089_MW288_250604 / 0089_QC103_250604	Perfluorooctane sulfonic acid (PFOS)	51%	0.16 µg/L	0.27 µg/L	No
	Perfluorohexane sulfonic acid (PFHxS)	133%	0.05 µg/L	0.25 µg/L	No
	PFAS (Sum of Total)	85%	0.21 µg/L	0.52 µg/L	No
	PFAS (Sum of Total)(WA DER List)	85%	0.21 µg/L	0.52 µg/L	No
	Sum of PFHxS and PFOS	85%	0.21 µg/L	0.52 µg/L	No
0089_MW288_250604 / 0089_QC203_250604	Perfluorooctane sulfonic acid (PFOS)	84%	0.16 µg/L	0.39 µg/L	No
	Perfluorohexane sulfonic acid (PFHxS)	146%	0.05 µg/L	0.32 µg/L	No
	PFAS (Sum of Total)	115%	0.21 µg/L	0.78 µg/L	No
	PFAS (Sum of Total)(WA DER List)	112%	0.21 µg/L	0.74 µg/L	No
	Sum of PFHxS and PFOS	109%	0.21 µg/L	0.71 µg/L	No
0089_MW249_250604 / 0089_QC202_250604	Perfluorooctane sulfonic acid (PFOS)	190%	0.02 µg/L	0.77 µg/L	No
	Perfluorohexanoic acid (PFHxA)	67%	0.02 µg/L	0.04 µg/L	Yes
	6:2 Fluorotelomer Sulfonate (6:2 FTS)	183%	<0.05 µg/L	1.1 µg/L	No
	PFAS (Sum of Total)	169%	0.18 µg/L	2.15 µg/L	No
	PFAS (Sum of Total)(WA DER List)	169%	0.18 µg/L	2.13 µg/L	No
	Sum of PFHxS and PFOS	143%	0.16 µg/L	0.96 µg/L	No
0089_MW282_250605 / 0089_QC104_250605	Perfluorooctane sulfonic acid (PFOS)	45%	73.0 µg/L	46.5 µg/L	No
	Perfluoropentane sulfonic acid (PFPeS)	66%	4.59 µg/L	9.11 µg/L	No
	Perfluorohexanoic acid (PFHxA)	37%	9.21 µg/L	13.4 µg/L	No
	Perfluorononanoic acid (PFNA)	40%	<0.02 µg/L	0.03 µg/L	Yes
0089_MW282_250605 / 0089_QC204_250605	Perfluoropentane sulfonic acid (PFPeS)	39%	4.59 µg/L	6.8 µg/L	No
0089_MW120_250606 / 0089_QC205_250606	Perfluorobutane sulfonic acid (PFBS)	40%	<0.02 µg/L	0.03 µg/L	Yes
	Perfluoroheptane sulfonic acid (PFHpS)	36%	0.37 µg/L	0.53 µg/L	No
0089_MW121_250606 / 0089_QC206_250609	Perfluorobutane sulfonic acid (PFBS)	188%	0.08 µg/L	2.5 µg/L	No
	Perfluoroheptane sulfonic acid (PFHpS)	158%	0.13 µg/L	1.1 µg/L	No

Primary & Duplicate Field IDs (Type)	Analyte	RPD	Primary Concentration	Duplicate Concentration	Concentrations within 10 x LOR?
	Perfluorooctane sulfonic acid (PFOS)	89%	9.08 µg/L	3.5 µg/L	No
	Perfluoropropanesulfonic acid (PFPrS)	196%	<0.02 µg/L	1.8 µg/L	No
	Perfluoropentane sulfonic acid (PFPeS)	168%	0.13 µg/L	1.5 µg/L	No
	Perfluorohexane sulfonic acid (PFHxS)	129%	1.99 µg/L	9.2 µg/L	No
	Perfluorobutanoic acid (PFBA)	164%	<0.1 µg/L	1.0 µg/L	No
	Perfluoroheptanoic acid (PFHpA)	88%	0.12 µg/L	0.31 µg/L	No
	Perfluorohexanoic acid (PFHxA)	159%	0.34 µg/L	3.0 µg/L	No
	Perfluorooctanoic acid (PFOA)	132%	0.12 µg/L	0.59 µg/L	No
	Perfluoropentanoic acid (PFPeA)	135%	0.16 µg/L	0.83 µg/L	No
	PFAS (Sum of Total)	70%	12.2 µg/L	25.33 µg/L	No
	PFAS (Sum of Total)(WA DER List)	55%	11.9 µg/L	20.93 µg/L	No

Sediment RPDs

For the sediment monitoring, a total 261 RPDs were calculated, and none exceeded the adopted (conservative) 30% RPD acceptable limit. All RPDs were expressed as zero as both the primary and duplicate/split sample concentrations were less than the laboratory LOR. The full calculations are provided in the attached Table QC.3.

B-2 Laboratory program

Laboratory QA/QC procedures and compliance during the investigation are summarised in Table 7, with exceptions detailed in the following subsections.

Table 6 Summary of laboratory QA/QC compliance

QA/QC element	Requirement	Requirement adhered to?	Information/ data acceptable?
NATA accreditation	Analysis of CoPC performed under NATA accreditation or equivalent government endorsed provider of accreditation.	Yes	Yes
Holding times	Laboratory to complete sample extraction and analysis of CoPC within method specifications.	Yes, with exceptions	Yes, see Section B-2.4.
Analytical methods	Sample analyses are to use appropriate methods for each CoPC with regard to Schedule B (3) of the *ASC NEPM* and in accordance with the laboratory's NATA accreditation.	Yes	Yes
Laboratory LORs	Laboratory LORs are below adopted assessment criteria.	Yes, per agreed SAQP	Yes
Laboratory QC results	No method blank, laboratory duplicates, laboratory controls, matrix spike or surrogate spike recovery outliers were identified. Sufficient quantities of laboratory QC analysis was undertaken.	Yes, with exceptions	Yes, see Section B-2.3.

B-2.1 Laboratory quality control procedures

Laboratory QC samples incorporated in the analytical process included:

- **Laboratory blind duplicates**: A laboratory blind duplicate provides data on the analytical precision and reproducibility of the analytical result. The laboratory blind duplicate is created by subsampling from one of the primary samples submitted for analysis. Laboratory blind duplicates are analysed at a rate equivalent to one in ten per analytical batch, or one sample per batch if less than 10 samples are analysed in a batch.
- **LCS:** The LCS analysis of either a reference material or a control matrix fortified with analytes representative of the analyte class. The purpose of LCS is to monitor method precision and accuracy independent of the sample matrix. Typically, the percentage recovery of the LCS is compared to the dynamic recovery limit based on the statistical analysis of the processed LCS analysis.
- **Matrix spikes**: Matrix spike sample analysis is the analysis of one or more replicate portions of samples from the batch, after fortifying the additional portion(s) with known quantities of the analyte(s) of interest. The percentage recovery of target analyte(s) from matrix spike samples is used to determine the bias of the method in the specific sample matrix.
- **Surrogate spikes**: Surrogate spikes provide a means of checking that no gross errors have occurred during any stage of the analytical method leading to significant analyte loss. Surrogate recoveries are similar to the analyte of interest in terms of chemical composition, extractability, and chromatographic conditions (retention time), but which are not normally found in environmental samples. Surrogate compounds are spiked into blanks, standards and samples submitted for organic analyses by gas-chromatographic techniques prior to sample extraction.
- **Method blanks**: Method or analysis blank sample analysis is the analysis of a sample that is as free as possible of the analytes of interest but has been prepared the same as the samples under investigation. The analysis is to ascertain if laboratory reagents, glassware and other laboratory consumables contribute to the observed concentration of analytes in the process batch. If below the maximum acceptable method blank (20% of the practical quantisation limit), the contribution is subtracted from the gross analytical signal for each analysis before calculating the sample analyte concentration. The method blank should return analyte concentrations as ‘not detected’.

B-2.2 Laboratory quality control results

Laboratory quality control results were compared against criteria set by ALS Environmental and Eurofins, which are largely based on the *ASC NEPM* and US EPA (2006) methods. The individual testing laboratories conducted an assessment of the laboratory QC program internally; however, the results were also independently reviewed and assessed by GHD. All laboratory quality control measures were within the adopted acceptance criteria with the exception of those described in the subsections below.

The exceptions were limited and comprised a very small proportion of the large number of quality control measures completed for the investigation. Based on this, the exceptions described in the subsections below are not considered to significantly influence data quality.

B-2.3 QC sample frequency – outliers

All laboratory QC samples were tested within the expected frequency, No quality control sample frequency outliers exist.

B-2.3.1 Matrix spike – outliers

All matrix spikes were of an acceptable recovery except for those summarised in Table 8. These outliers only represent a small portion of the internal lab QC program conducted. Therefore, these minor non-compliances are not considered to have materially affected the conclusions of this report.

Table 7 Matrix spike outliers

Lab report	Sample ID	Analyte	Data	Limits	Comment
EP2509632	0089_MW128_250606	PFOS	-	-	MS recovery not determined, background level greater than or equal to 4x spike level
	0089_MW125_250606	8:2 Fluorotelomer sulfonic acid (8:2 FTS)	197%	67.0 – 138%	Recovery greater than upper data quality objective
	0089_MW125_250606	10:2 Fluorotelomer sulfonic acid (10:2 FTS)	136%	70.0 – 130%	Recovery greater than upper data quality objective

B-2.3.2 Laboratory control spike – outliers

All laboratory control spike outliers were of an acceptable recovery except for the one summarised in Table 9. This outlier only represents a small portion of the internal lab QC program conducted. Therefore, this minor non-compliance is not considered to have materially affected the conclusions of the report.

Table 8 Laboratory control spike outliers

Lab report	Sample ID	Analyte	Data	Limits	Comment
EP2509632	QC-6662606-002	8:2 FTS	144%	67 – 138%	Recovery greater than upper control limit

B-2.3.3 Surrogate recovery – outliers

All laboratory surrogates were an acceptable recovery

B-2.3.4 Duplicate – outliers

Samples were analysed and received acceptable RPDs

B-2.4 Holding time – outliers

Samples were analysed within appropriate holding times, No holding time outliers exist.

B-3 Data quality indicator evaluation

An evaluation of the DQIs set for this assessment was undertaken subsequent to field works and laboratory analysis, this evaluation is presented in Table 10.

Table 9 Data quality indicator evaluation

DQI	Evaluation criteria	Acceptable?
Completeness	All locations that were proposed to be sampled were sampled where possible. Samples were analysed according to the OMP SAQP (GHD, 2025).	Yes
	All field documentation is complete and correct, including chain of custody documentation for samples.	Yes
	Field forms and documentation capture all relevant important information.	Yes
	Samples were analysed within appropriate holding times.	Yes
	Appropriate laboratory limits of reporting for comparison to relevant assessment criteria.	Yes

DQI	Evaluation criteria	Acceptable?
Comparability	Standardised operating procedure for groundwater sampling was adhered to and is in line with relevant guidelines.	Yes
	Field staff were experienced in the sampling of groundwater and were appropriately trained.	Yes
	Consistent laboratory use with consistent analytical methods used.	Yes
	Climatic conditions consistent and considered representative of region.	Yes
Representativeness	Samples were collected in a uniform and consistent manner, therefore representative of the media in the field.	Yes
Precision	Sufficient quantities of field blind and split duplicates were collected to enable comparison within and between laboratories.	Yes
	Sufficient quantities of internal laboratory duplicates were analysed to enable comparison within laboratories.	Yes
	Relative percentage difference calculations show that a large majority of duplicate sample concentrations are within defined difference limits.	Yes
	Field equipment was calibrated by equipment supplier (Appendix D).	Yes
Accuracy	Sufficient quantities of field blanks, rinsate blanks and transport blanks were collected and analysed, with no results indicating cross contamination.	Yes
	Sufficient quantities of internal laboratory method blanks, surrogate spikes and laboratory control samples were analysed to determine laboratory accuracy, with the large majority of samples within defined limits.	Yes

Based on the results of the evaluation of the QA/QC data described in the previous sections, the reported QA/QC non-compliances are not considered likely to significantly influence the reliability of the analytical data. It is further considered that:

– The field and laboratory quality assurance measures implemented provide a reasonable level of confidence that the data collected and reported is appropriately complete, comparable and representative.
– The field and laboratory quality control measures implemented provide a reasonable level of confidence that the data collected and reported is appropriately accurate and precise.
– The overall review of the QA/QC results indicates that the data collected for the investigation is of acceptable quality upon which to provide an adequate and reliable assessment of the property.

Appendix B

Comments

#1 Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
#2 Reported Analyte LOR is higher than Requested Analyte LOR
#3 The LORs have been raised due to matrix interference

***RPDs have only been considered where a concentration is greater than 1 times the EQL.**
****Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 30 (1 - 10 x EQL); 30 (10 - 30 x EQL); 30 (> 30 x EQL))**
*****Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory**

Comments
#1 Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
#2 Reported Analyte LOR is higher than Requested Analyte LOR
#3 The LORs have been raised due to matrix interference

***RPDs have only been considered where a concentration is greater than 1 times t**
****Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs**
*****Interlab Duplicates are matched on a per compound basis as methods vary be**

***RPDs have only been considered where a concentration is greater than 1 times the EQL.**
****Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 30 (1 - 10 x EQL); 30 (10 - 30 x EQL); 30 (> 30 x EQL))**
*****Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory**

Comments

#1 Reported Analyte LOR is higher than Requested Analyte LOR
#2 The LORs have been raised due to matrix interference
#3 Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.

Calibration Report

Multi-Parameter Water Quality Instrument

Customer:
Contact:

Manufacturer: YSI
Instrument: Professional Plus with Quatro cable
Serial #: 22F101914
Cable length: 1m (22B100428)

Item	Test	Pass	Comments
Battery	2 x Alkaline C-cells	✓	Voltage reading above 2.9V
	Battery Saver	✓	Automatically turns off after 30 minutes if not used
Connections	Condition	✓	Good, clean
Cable	Condition	✓	Clean, no tears
Display	Operation	✓	
Firmware	Version	✓	4.0.0
Keypad	Operational	✓	
Display	Screen	✓	
Unit	Condition, seals and O-rings	✓	
Monitor housing	Condition	✓	
pH			
Condition		✓	Good, clean
pH millivolts for pH7 calibration range 0 mV ± 50 mV		✓	
pH 4 mV range + 165 to + 180 from 7 buffer mV value		✓	171.80 mV
pH slope		✓	55 to 60 mV/pH, ideal 59mV 58.01
Response time < 90 seconds		✓	
Calibrated and conforms to manufacturer's specifications		✓	
ORP			
Condition		✓	Good, clean
Response time < 90 seconds		✓	
within ± 80mv of reference Zobell Reading		✓	
Calibrated and conforms to manufacturer's specifications		✓	variance range ± 20mV 11 mV
Conductivity			
Condition		✓	Good, clean
Temperature		✓	°C
Conductivity cell constant 5.0 ± 1.0 in GLP file		✓	
Clean sensor reads less than 3 uS/cm in dry air		✓	
Calibrated and conforms to manufacturer's specifications		✓	µs/cm
Dissolved Oxygen			
Condition		✓	Good, clean
DO sensor in use		✓	polarographic
1.25 mil PE membrane (yellow membrane):		✓	
DO Sensor Value		✓	(min 4.31 uA - max 8.00 uA) Avg 6.15 uA
Calibrated and conforms to manufacturer's specifications		✓	ppm

This is to certify that the above instrument has been calibrated to the following specifications:

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Laboratory Manager (Perth)	Perth Inorganics, Wangara, WA
[redacted]	Organic Supervisor	Perth Organics, Wangara, WA

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: LOR has been raised for particular analytes on certain samples due to matrix interference.
- EP231X: High matrix spike and LCS recoveries deemed acceptable as all associated analytes are <LOR.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per USEPA 1633 limits where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

No. of samples received	: 203		
No. of samples analysed	: 202		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Laboratory Manager (Perth)	Perth Inorganics, Wangara, WA
[redacted]	Organic Supervisor	Perth Organics, Wangara, WA

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **SOIL**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EP2509632**	Page	: 1 of 25
Client	: **GHD PTY LTD**	Laboratory	: Environmental Division Perth
Contact	: [redacted]	Telephone	: +61-8-9406 1301
Project	: WA_0089_PFASOMP_25	Date Samples Received	: 18-Jun-2025
Site	: 0089	Issue Date	: 28-Jun-2025
Sampler	: [redacted] [redacted]	No. of samples received	: 203
Order number	: 12641234/02.2.6	No. of samples analysed	: 202

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Laboratory Control Spike (LCS) Recoveries							
EP231D: (n:2) Fluorotelomer Sulfonic Acids	QC-6662606-002	----	**8:2 Fluorotelomer sulfonic acid (8:2 FTS)**	39108-34-4	144 %	67.0-138%	**Recovery greater than upper control limit**
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	EP2509632--011	0089_MW128_250606	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231D: (n:2) Fluorotelomer Sulfonic Acids	EP2509632--008	0089_MW125_250606	**8:2 Fluorotelomer sulfonic acid (8:2 FTS)**	39108-34-4	197 %	67.0-138%	**Recovery greater than upper data quality objective**
EP231D: (n:2) Fluorotelomer Sulfonic Acids	EP2509632--008	0089_MW125_250606	**10:2 Fluorotelomer sulfonic acid (10:2 FTS)**	120226-60-0	136 %	70.0-130%	**Recovery greater than upper data quality objective**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. A portion of homogenised sample is extracted along with isotope dilution standards (where commercially available) in a solution of ammonium acetate in acetonitrile/methanol. Where relevant, interferences from co-extracted organics are removed using dispersive clean-up media (dSPE). A portion of extract is combined with an equal volume of reagent water and filtered for instrumental analysis.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction (SPE) followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. Isotope dilution standards (where commercially available) and surrogates are added to the sample container. The entire contents are transferred to a weak anion exchange (WAX) solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Data quality objectives for internal standard recoveries are based on US EPA method 1633.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	* ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
Solid Phase Extraction (SPE) for PFAS in water	* ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Please see scanned COC for sample discrepencies: extra samples , samples not received etc.
- Please direct any queries related to sample condition / numbering / breakages to Sample Receipt (Samples.Perth@alsglobal.com)
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Perth, NATA accreditation no. 825, site no. 15847.
- Please direct any turnaround / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **pH analysis should be conducted within 6 hours of sampling.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation Number 2377
Site Number 2370 & 2554

Accredited for compliance with ISO/IEC 17025 – Testing
NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, medical testing, calibration, inspection, proficiency testing scheme providers and reference materials producers reports and certificates.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
ppm: parts per million
µg/L: micrograms per litre
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit
Colour: Pt-Co Units (CU)

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
J+	If the percent recoveries were greater than the upper control limit, qualify detects for the analyte in associated samples as estimated with a positive bias J+.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Perfluoroalkyl carboxylic acids (PFCAs)	Welshpool	Jun 17, 2025	28 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
ppm: parts per million
µg/L: micrograms per litre
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit
Colour: Pt-Co Units (CU)

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
G01	The LORs have been raised due to matrix interference
J-	If the percent recoveries were less than the lower control limit, qualify detects for the analyte in associated samples as estimated with a negative bias J-.
J+	If the percent recoveries were greater than the upper control limit, qualify detects for the analyte in associated samples as estimated with a positive bias J+.
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Hi Eurofins,
We have recently received your COC report # 1233380 for Project WA_0089_PFASOMP_25.

Thankyou for picking up on sample 0089_QC204_250605 missing from the COC, please proceed your selected analysis.

A couple of changes need to be made to some of the samples, please see below

0089_QC217_250617 → Please Change to → 0089_QC217_250616

0089_QC218_250618 → Please change to → 0089_QC218_250616

Please let me know if you require anymore information.

Kind regards,

[redacted]

Sample Receipt Advice

Company name:	GHD Pty Ltd WA
Contact name:	- ALL GHD lab reports
Project name:	WA_0089_PFASOMP_25
Project ID:	Not provided
Turnaround time:	5 Day
Date/Time received	Jun 17, 2025 11:40 AM
Eurofins reference	1233380

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 8 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Received additional sample 0089_QC204_250605 not listed on CoC; sample has been logged for testing

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

[redacted] **on phone : or by email:** [redacted]**eurofinsanz.com**

Results will be delivered electronically via email to - ALL GHD lab reports - ghd.labreports@ghd.com.

Note: A copy of these results will also be delivered to the general GHD Pty Ltd WA email address.

Round:		**Field Filtered?**					

Time (hh:mm)	Volume (L)	Temp (°C)	pH (pH units)	Elec.Cond (µs/cm)	Dis.Oxygen (mg/L)	Ox-Red Pt. (± mV)	TDS (mg/L)	SWL (m bTOC)	Comment: Colour, turbidity, sediment load, sheen, odour, flow rate, purged dry?
Stable when (3 consecutive readings):		*+/- 0.2 °C*	*+/- 0.05 pH*	*+/- 3%*	*+/- 10%*	*+/- 10 mV*		*stable*	
									Could not complete due to refusal. Attempted to sample at 4 locations.

Field QA Checks:	
Air bubbles in vials or violent reactions?	
Decontamination as per GHD procedure?	
Was sampling equipment pre-cleaned?	
COC updated?	

Stabilisation Readings

- Current parameter is stablised based on the previous 3 readings
- Current parameter is not stabilised based on the previous 3 readings
- Potential data entry error, confirm the value entered is correct

Purge Volumes

Casing Int. Dia (mm)	50	100	150
Vol (L/m of casing)	2.0	7.9	17.7

EROSION	

DESCRIPTIONS

SURFACE WATER (colour, turbidity, odour, sheen)	clear, colourless, low turbidity, no sheen, no odour
SEDIMENT (describe as soil)	SAND, yellow/grey, poorly graded, med to coarse, subrounded, moist, some fine shell matter

FIELD MEASUREMENTS

TEMPERATURE (°C)	20.4
DO (mg/L)	11.04
DO (%S)	152.80
CONDUCTIVITY (µS/cm)	53697.0
pH (pH units)	8.31
REDOX (mV)	-264.9
TURBIDITY (NTU)	TDS (mg/L) -

PROJECT NAME:	Defence OMP	**SEDIMENT ID:**	
CLIENT:	Department of Defence	**DATE:**	13/06/2025 **TIME:** 3:10:00 PM
SITE:	HMAS Stirling	**LOGGED BY:**	[redacted]

COORDINATES/GPS *(if applicable)*

SAMPLING METHOD *(ie grab, bucket)* **SURFACE WATER:** Grab **SEDIMENT:**

DETAILED SAMPLE LOCATION DESCRIPTION SW from ocean

ENVIRONMENTAL OBSERVATIONS

WEATHER	slightly cloudy, wind less then 15 knts
VEGETATION	beach shrubs
SLOPE	gentle gradient sloping east
EROSION	

DESCRIPTIONS

SURFACE WATER (colour, turbidity, odour, sheen)	clear, colourless, low turbidity, no sheen, saltwater/seaweed odour
SEDIMENT (describe as soil)	

FIELD MEASUREMENTS

TEMPERATURE (°C)	18.2
DO (mg/L)	10.08
DO (%S)	
CONDUCTIVITY (µS/cm)	53485.0
pH (pH units)	7.90
REDOX (mV)	-347.1
TURBIDITY (NTU)	TDS (mg/L) - 34765

1. Introduction

GHD Pty Ltd (GHD) has been engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) at His Majesty's Australian Ship (HMAS) Stirling (hereafter referred to as the 'base') in Western Australia (WA). The location of the base, the surrounding PFAS Management Area and key base features are shown in Figure 1 and Figure 2, Appendix A.

The OMP (Defence, 2019) and its associated Sampling Analysis and Quality Plan (SAQP) (GHD, 2025) outline the rationale and scope for the monitoring of concentrations and extent of PFAS in groundwater, porewater, surface water, and sediment at the base and within the Management Area. Monitoring is undertaken on a quarterly basis including March, June, September and December sampling events[1]. This Sampling Event Report documents the results of the September 2025 Sampling Event.

1.1 Objectives

The key objectives of the OMP are to evaluate:

- The spatial and temporal (including seasonal) nature and extent of PFAS impact in the environment associated with site sources of PFAS derived from legacy use of aqueous film-forming foam (AFFF);
- Changes to the Conceptual Site Model (CSM), which describes the current understanding of PFAS sources, transport pathways and receptors;
- Whether current risks to human and ecological receptors require review;
- The influence that risk management activities at the base, as outlined in the PFAS Management Area Plan (PMAP) (Defence, 2019) have had on PFAS in the environment; and
- Whether any identified changes trigger an action and/or review.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PMAP.

1.2 Purpose of this Report

This Sampling Event Report has been prepared to document the results of the September 2025 sampling event, specifically highlighting first-time detections and/or new exceedances of relevant guideline values for perfluorooctane sulfonic acid (PFOS), perfluorohexane sulfonic acid (PFHxS), perfluorooctanoic acid (PFOA) and perfluorobutane sulfonic acid (PFBS).

An Ongoing Monitoring Report (OMR) will be prepared following the completion of each 12-month sampling period or as otherwise agreed.

This report has been prepared with reference to the Defence *Ongoing Monitoring Program Reporting Guidance* issued in February 2024 (Defence, 2024).

[1] Sampling was not scheduled for December 2025, as per Defence instruction, see Section 6.2.

2. Scope of Work

The scope of work was completed with reference to the OMP SAQP (GHD, 2025), as follows:

– Organise fieldwork and obtain approval for base access to monitoring locations.
– Collection of samples and water quality parameters from nominated locations (refer to Section 2.1).
– Collect and analyse samples for quality assurance and quality control (QA/QC).
– Analysis of samples for PFAS at the limit of reporting (LOR) nominated in the SAQP.
– Data management of the OMP field and laboratory data in the Defence ESdat database.
– Preparation of this Sampling Event Report for the September 2025 sampling event.

2.1 Sampling Locations

2.1.1 Groundwater

The groundwater monitoring locations are presented in Table 1 and are shown in Figure 3 to Figure 7 in Appendix A.

Table 1 OMP Groundwater Monitoring Locations

Area	Monitoring Well ID
Fire Training Area	MW109, MW112, MW500, MW120, MW121, MW123, MW124, MW125, MW126, MW127 and MW128
Demolition Ground	MW139, MW141, MW142, MW147 and MW149
WWTP	MW158, MW161, MW166, MW171, MW173, MW193, MW195D, MW195S, MW196, MW199, MW200, MW202, MW203 and MW468
Helicopter Support Facility	MW214, MW215, MW216, MW217, MW220, MW224, MW225, MW226, MW227, MW228 and MW282
Accommodation Area	MW288 and MW289
Dredged Sediments	MW268 and MW269
AVCAT Storage and Fuel Farm	MW233, MW236, MW238, MW239, MW240, MW242, MW243, MW245, MW249, MW496 and MW516
Fire Station, Flammable/Hazardous Goods and Waste Storage, Ship Sullage	MW010, MW255, MW256, MW257, MW258, MW259 and MW553

2.1.2 Porewater, surface water and sediment monitoring locations

The porewater, surface water and sediment locations are presented in Table 2 and are shown in Figure 3 to Figure 7 in Appendix A.

Table 2 OMP Porewaters, Surface Water and Sediment Monitoring Locations

Area	Surface water sampling Location ID	Sediment Sampling Location ID	Porewater Sampling Location ID
Fire Training Areas	SW130, SW132, SW134	SD335, SD340, SD341, SD362, SD363, SD364	PW335, PW340, PW341, PW362, PW363, PW364

Dredged Sediments	SW317, SW318, SW319	SD374, SD375, SD378	PW374, PW375, PW378

2.2 SAQP Deviations

The September 2025 sampling event was completed with reference to the OMP SAQP (GHD, 2025), GHD's health and safety protocols and GHD's standard operating procedures for field work, which have been developed in accordance with WA contaminated land guidance. Material deviations from the OMP SAQP are summarised in Table 3.

Table 3 Summary of Deviations from the OMP SAQP

Location	Deviation	Comments
MW166	Sampled using a bailer	Attempt to sample MW166 (WWTP area) initially occurred on 18 September 2026. Insufficient water was identified in the water column to fill the HydraSleeve® so a top weight was applied to compress the HydraSleeve® (per the methodology outlined in Section 3.1.1). The top-weighted HydraSleeve® was recovered on 23 September 2025 though still contained insufficient water to allow collection of a sample and measurement of field parameters. As such, a bailer was used to recover the required volume of water as the depth to water (11.375 m btoc) is beyond the capability of the low flow peristaltic pump to be used. All other aspects of the sampling methodology were as outlined in Section 3.1.1. **Minimal impact** –Recorded PFAS concentrations at the location were consistent with historical data.
MW158, MW193 and MW195S (WWTP)	Not sampled	MW158 was unable to be located due to the presence of dense vegetation (weeds) growing in the area at the time of the sampling event. MW195S was blocked at the time of the sampling event and was therefore unable to be sampled. Due to field error, monitoring well MW079 was sampled in place of MW193. The data obtained from MW079 has been presented in this report. **Minimal impact** – Hydraulically down-gradient groundwater water locations (i.e., closer to the receiving environment) including MW196, MW199 and MW468 were able to be sampled to provide an assessment of risks to the marine environment, which is the primary sensitive receptor for the base. Base-wide groundwater contours were able to be inferred based on the wider monitoring network. The forthcoming OMP Revision will review the value of the monitoring well in the context of the OMP objectives and make a recommendation for repair, re-installation or otherwise. MW079 is located directly adjacent to MW193 on the southern side of the WWTP, with both wells screened within the same interval (10.5-13.5 mbgl). Concentrations reported in MW079 in September 2025, were generally consistent with historical concentrations for MW193 and within a similar order of magnitude. Thus, MW079 is considered representative of conditions monitored at MW193 and sampling of this well is not considered to impact any conclusions drawn during this monitoring period.
MW249	Not sampled	MW249 (AVCAT Storage and Fuel Farm area) was unable to be located during the sampling event and was suspected to have been beneath a soil stockpile that was present at the well location. **Moderate impact** –There are no monitoring locations downgradient of MW249 to provide an up-to-date assessment of risks to the marine environment, which is the primary sensitive receptor for the base. PFAS concentrations at the monitoring well have, however, been consistent since monitoring commenced in 2017 through to the previous OMP sampling event in June 2025. Access to the location will be sought during future sampling events, with support from base personnel where possible.

Location	Deviation	Comments
Multiple locations	Total dissolved solids (TDS) not recorded	Due to field error, TDS was not recorded when conducting surface water sampling at all locations apart from those associated with the Demolition Ground. **Minimal impact –** Salinity at the surface water monitoring locations, which represent the marine environment of the Cockburn Sound and Indian Ocean, is well understood from historical data and can also be assessed based on electrical conductivity, which was recorded during the sampling event.

3. Methodology

3.1 Sampling Methodology

The methodology for the September 2025 sampling event was completed with reference to the OMP SAQP (GHD, 2025) as outlined in the following sections.

3.1.1 Groundwater sampling

The groundwater sampling methodology is outlined in Table 4.

Table 4 Groundwater Monitoring Wells – Sampling Method

Activity	Details
Well gauging	Monitoring wells were first gauged to allow subsequent correction of groundwater levels relative to Australian Height Datum (AHD) prior to groundwater sample collection. All depth measurements referenced the top of casing (TOC) of the monitoring well as an established datum.
Groundwater physicochemical parameters	Groundwater physiochemical parameters were recorded via a water quality meter from HydraSleeves® or purged water via peristaltic pump. The following parameters were recorded: – pH. – electrical conductivity (EC). – oxidation reduction potential (ORP). – Dissolved oxygen (DO). – Temperature. – Total Dissolved Solids (TDS). The water quality meter was calibrated by the equipment supplier and daily readings of reference solutions (“bump tests”) were completed to optimise the accuracy of the measurements taken (see Appendix D). General observations regarding water quality (e.g., turbidity, colour etc.) or obvious indicators of contamination (e.g., sheens) were also recorded.
Deployment and retrieval of HydraSleeves®	In compliance with section 18 of the Heads of EPA National Environmental Management Plan 3.0 (HEPA NEMP), groundwater samples were collected using bore-dedicated polypropylene HydraSleeves®. The HydraSleeves® were installed and left in place for a minimum of 24 hours prior to retrieving for sample collection. Where monitoring well construction details were available, the HydraSleeves® were positioned to target the approximate mid-section of the water column beneath the screened interval. Where construction details were not available, the HydraSleeves® were placed approximately 1 m from the base of the monitoring well (where sufficient depth of water was present within the well column). Samples were collected via continuous pull method at a rate allowing the water to pass through the check value into the sample sleeve. Samples were discharged immediately (to minimise changes in chemistry) via discharge tube. Following sampling, new HydraSleeves® were deployed in preparation for the next OMP monitoring event using the same string for consistency (same depth of sampling i.e. within screen depth).
Alternative sampling methodology (low flow micro-purge)	In the event the water column wasn’t sufficient to fill the HydraSleeve®, the HydraSleeve® was deployed with a top weight to compress the HydraSleeve® and left in wells for a minimum of 24 hours to allow stabilisation. During the September 2025 sampling event, this approach was applied at MW161. If the HydraSleeve® was then retrieved with no or insufficient sample volume, low flow sampling occurred via a low flow micro-purge pump using the following methodology: – Post-gauging, each monitoring well was purged using a low flow micro-purge pump fitted with bore-dedicated inert silicone and High-density Polyethylene (HDPE) tubing. The upper end of the tubing was connected to the flow cell of a water quality meter positioned to prevent entrapment of oxygen. – The pump intake was placed approximately 0.5 m below the top of screen (or at least 0.5 m below the top of the water column) to ensure collection of samples representative of groundwater quality beneath the base. – Measurement of water quality parameters was undertaken immediately after the flow cell was full and continued thereafter at two to five-minute intervals during the purging process.

Activity	Details
	– Purging was undertaken until stabilisation of field parameters was achieved after which the well was subsequently sampled. Parameters were considered stable when they are within the following range (where practicable within the time constraints of the program): • Temperature: +/- 0.2 °C* • pH: +/- 0.05 • EC: +/- 3% • DO: +/- 10% • ORP: +/- 10mV – Representative groundwater samples were collected directly from the HDPE tubing into laboratory supplied sample containers. During the September 2025 sampling event, the alternative sampling methodology was required at monitoring well MW236 and MW239. **Note: The OMP SAQP (GHD, 2025) erroneously states variation in temperature should be +/- 0.02 °C rather than +/- 0.2 °C*
Field records	Field records included the following information: – Gauging data – Sampling time and date. – Weather conditions. – Sample collection method. Where a HydraSleeve® is used for sample collection, the target interval depth was recorded. – Stabilised field parameters. – Observations regarding water quality (e.g., turbidity, colour etc.) or obvious indicators of contamination (e.g., sheens). – Sampling equipment decontamination procedures where non-disposable sampling equipment is utilised. – Calibration and daily bump test records. – Well gauging records. All sample documentation including field notes, reporting records, Chain of Custody (CoC) and equipment calibration certificates and procedures were retained within project files.
Decontamination procedure	Dedicated HydraSleeves® or HDPE tubing (in the event that a HydraSleeve® was not used) was used at each groundwater bore, thus removing the need for decontamination of these items. Single use nitrile gloves were worn during sampling and appropriately disposed of between each sampling location. All re-usable sampling equipment was thoroughly washed using PFAS and phosphate-free detergent (mixed per supplier instructions) then double rinsed with laboratory-supplied rinsate water before the sample collection.
Sample identification, preservation transport and holding times	Each sample bottle was pre-labelled by the laboratory with a unique barcode which was scanned into a mobile application to generate the CoC. Samples were collected directly in laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under CoC documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998).

3.1.2 Porewater sampling methodology

The methodology for porewater sampling is outlined in Table 5.

Table 5 Porewater Sampling Methodology

Item	Details
Porewater sample collection	Sampling was conducted using a reusable stainless-steel piezometer which has a screened zone consisting of a series of very fine interlaced machined slots to allow porewater to enter the sampler. Seepage sampling occurred during outdoing tides, as far as practicable within the temporal constraints of the tidal cycle at the time of the event.

Item	Details
	The sampling end of the piezometer was inserted into the surficial marine sediments to approximately 0.5 m below the surface. Once the target sample depth was reached, porewater was collected using a peristaltic pump fitted with bore-dedicated silicone and HDPE tubing into laboratory supplied bottles. Field parameters were recorded (pH, EC, TDS, ORP, DO and temperature). Purging prior to sampling was not considered necessary due to the highly transmissive nature of the intertidal zone sediments. Field EC and/or TDS readings were used to assess whether the porewater sample is representative of discharging groundwater and not purely seawater.
Field records	Field records included the following information: – Sampling time and date. – Weather conditions. – Sample collection method. – Field parameters – Observations regarding water quality (e.g., turbidity, colour etc.) or obvious indicators of contamination (e.g., sheens). – Sampling equipment decontamination procedures where non-disposable sampling equipment is utilised. All sample documentation including field notes, reporting records, COC and equipment calibration certificates and procedures were retained within project files.
Decontamination	Single use nitrile gloves were worn during sampling and appropriately disposed of between each sampling location. Tubing was replaced at each sampling location. All re-usable sampling equipment was thoroughly washed using PFAS and phosphate-free detergent (mixed per supplier instructions) then double rinsed with laboratory-supplied rinsate water before the sample collection.

3.1.3 Surface water sampling methodology

The methodology for the surface water monitoring is detailed in Table 6.

Table 6 Surface Water Monitoring

Item	Details
Field parameters	Surface water physiochemical parameters (i.e. pH, EC, ORP, DO, and temperature) were recorded at the time of sampling using a pre-calibrated water quality meter. Field observations such as odours or sheen presence were also recorded on field sampling sheets.
Sampling method	Where the embankment of the water body was stable and the water body could be safely accessed, surface water samples were collected by hand, directly into the laboratory supplied sample containers using a 'grab' (manual) sample method. Where depth permitted, the sample container was positioned at least 10 cm below the surface water level and above the sediment bed and oriented with the capped opening facing downwards to avoid the collection of surface films. Once in position, the container cap was removed to allow sample collection. Where sampling points cannot be safely accessed, surface water samples were collected using a long-handled sampler and decanted into the laboratory supplied sample containers. Samples were collected with reference to Australian/New Zealand Standards (AS/NZS 5667.1:1998) Water quality – Sampling – Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples.
Sample collection	Water samples were placed directly into appropriately labelled, laboratory supplied sample bottles and packed in chilled containers for delivery to the laboratory under Chain of Custody documentation.
Decontamination	Single use nitrile gloves were worn during sampling and appropriately disposed of between each sampling location. All re-usable sampling equipment was thoroughly washed using PFAS and phosphate-free detergent (mixed per supplier instructions), then double rinsed with laboratory supplied rinsate water before the sample collection.

Item	Details
Sample identification, preservation, transport and holding times.	Each sample container was pre-labelled by the laboratory with a unique barcode which was scanned into a mobile application to generate the CoC. Samples were contained in laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under Chain of Custody documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998 as appropriate).
Field records	Field records included the following information: – Sampling time, date and name of the sampler. – Weather conditions. – Sample collection method. – Field parameters – Observations regarding water quality (e.g. turbidity, colour etc.) or obvious indicators of contamination (e.g. sheens). – Depth of water body, flow rate and sample depth. – Sampling equipment decontamination procedures where non-disposable sampling equipment was utilised. – Calibration records. All sample documentation including field notes, reporting records, CoC and equipment calibration certificates and procedures were retained within project files.

3.1.4 Sediment sampling methodology

The methodology for sediment sampling is detailed in Table 7.

Table 7 Sediment Investigation Methodology

Item	Details
Sample collection	Sediment samples were collected at the sediment/water interface using hand tools (e.g. trowel, hand auger, PVC pipe etc.) with samples placed directly into appropriately labelled, laboratory supplied sample containers and packed in chilled containers for delivery to the laboratory under Chain of Custody documentation. At each sampling location, the sediment sample will be visually assessed and observations (including physical description) recorded on field data sheets.
Field records	Field records included the following information: – Sampling time, date and name of the sampler. – Sample description. – Weather conditions. – Sample collection method. – Observations regarding sediment quality (e.g., colour, grain size etc.) or obvious indicators of contamination (e.g., staining). – Sampling equipment decontamination procedures where non-disposable sampling equipment was utilised. All sample documentation including field notebooks, reporting records, CoC and equipment calibration certificates and procedures were retained within project files.
Decontamination	Single use nitrile gloves were worn during sampling and appropriately disposed of between each sampling location. All re-usable sampling equipment was thoroughly washed using PFAS and phosphate-free detergent (mixed per supplier instructions) then double rinsed with laboratory-supplied rinsate water before the sample collection.

3.2 Quality Assurance and Quality Control

Quality assurance (QA) involves all the actions, procedures, checks and decisions, undertaken to ensure the representativeness and integrity of samples and accuracy and reliability of analytical results (NEPM, 2013). Quality control (QC) involves protocols to monitor and measure the effectiveness of QA procedures.

The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (GHD, 2025). A review of the field and laboratory QA/QC performance from the investigation is presented in the QA/QC data validation report, Appendix B. Key findings of the data validation report include:

– The majority of the calculated relative percentage difference (RPD) in concentrations for each duplicate pair, as presented in the tables in Appendix B were within acceptable limits. In most cases, RPD values greater than the acceptance criterion of 30% are considered reflective of the proximity of the reported concentrations to the LOR (i.e., less than 10 times the LOR) or are associated with concentrations that are within the same order of magnitude. On this basis, the RPDs greater than 30% are considered to have minimal impact on the data quality.
– Field blank analytical results were less than the LOR in all cases.
– Rinsate blank analytical results were less than the LOR in all cases.

Overall, the QA/QC assessment concluded that the collected data is considered appropriate for the work undertaken and are considered usable for the purpose of this assessment.

All data collected during this event has been reviewed and uploaded to the Defence ESdat database in accordance with Defence Contamination Management Manual (DCMM) requirements (Defence, 2021).

4. Guideline Values

A summary of the current PFAS guideline values for groundwater, porewater and surface water considered relevant to the base is presented as Table 8. The guideline values are largely based upon:

– The PFAS NEMP (HEPA, 2025) which presents a consolidated set of health- and ecology-based Australian PFAS assessment levels for soil and water that are derived from various guidelines and publications. It is noted that the aquatic ecosystems guideline value for PFOS is lower than the standard LOR that was applied at the porewater and surface water monitoring locations. This is not considered limiting upon the groundwater dataset however, noting that groundwater is not abstracted on the base for potable use (GHD, 2025).
– The National Health and Medical Research Council (NHMRC) Australian Drinking Water Guidelines (ADWGs) for PFAS that were published on 25 June 2025 (NHMRC, 2025). It is noted that the ADWG value for PFOS is less than the standard PFAS LOR that was applied at the groundwater monitoring locations.

It is noted that there is currently no Australian regulatory endorsed screening criteria for risk posed to ecology or human health by PFAS in sediment.

Table 8 Relevant PFAS Assessment Guideline Values

Exposure scenario	Source	Assessment guideline value (µg/L)				
		PFOS	PFHxS	PFOS+ PFHxS	PFOA	PFBS
Groundwater						
Health: potable use of groundwater	NHMRC (2025)	0.008	0.03	-	0.2	1
Porewater and surface water						
Health: Recreational water use	PFAS NEMP	2	2	2	10	-
Ecology: aquatic ecosystems (99% species protection)	PFAS NEMP	0.00023	-	-	19	-

It is important to note that an Ecological Risk Assessment (ERA) (RPS, 2018b) has been completed for the base to assess the potential risks to the environment associated with presence of PFAS within the Management Area. The ERA incorporated multiple line of evidence, including site-specific exposure point concentrations (EPCs), measured PFAS concentrations in biota and food-web modelling. While the OMP evaluates PFAS concentration data with reference to the ecology-based screening criteria identified in Table 8, these criteria are intended to provide context to the magnitude of the reported concentrations and identify first-time detections, new exceedances and other notable changes relative to previous monitoring events. Consideration of whether ecological risks have materially changed remains reliant on the broader weight-of-evidence assessment established by the ERA and will be further evaluated in the Ongoing Monitoring Report (OMR).

5. Field Observations and Results

5.1 General Observations

The sampling event was completed over 10 days between 9 and 23 September 2025 (comprising 9 to 12 September, 15 to 19 September and 23 September). The weather conditions and general observations (including activities that may impact the monitoring program) recorded during the sampling event are summarised in Table 9.

Table 9 General Observations

Items	Observations
Weather Conditions	The weather during the sampling event was generally described as fine, with maximum temperatures of between 14.8°C (9 September) and 25.9°C (23 September) and some rainfall. 26 mm of rainfall was recorded between 15 and 19 September. The greatest volume of rainfall was 14 mm on 17 September 2025. Information obtained from Garden Island HSF (Station ID 009256) (Bureau of Meteorology, 2025).
Estate Management Works, Training Activities and/or Construction Works.	Construction of a new building was underway adjacent to the west side of the AVCAT Storage Facility source area. GHD understands these works were unrelated to the PMAP.

5.2 Field Observations and Measurements

The observations and measurements recorded during the field activities for the September 2025 quarterly sampling event are summarised in Table 10. Field notes are presented in Appendix F.

Table 10 Summary of Field Observations and Measurements

Item	Description
Access and sample collection	Most sampling locations were accessible and able to be sampled, apart from those identified in Table 3. Consistent with the June 2025 sampling event, the measured well depth in some monitoring wells (i.e., MW121, MW142, MW166, MW193, MW195D, MW282, MW500, MW553), when compared to the constructed well depth, suggests sediment may have accumulated within the monitoring wells (refer to Table C1, Appendix C). The wells were still able to be sampled.
Water and sediment observations	Groundwater was predominantly clear, colourless to pale yellow, brown or white with varying turbidity, no odour or sheen. A hydrocarbon odour was noted at MW516 and MW553. Porewater was predominantly clear and colourless with low sediment load and no odour or sheen. Surface water was predominantly clear and colourless with low sediment load and no sheen or odour. High sediment load and the presence of seaweed was noted at some locations including SW130, SW305 and SW372. Sediment was mostly moist to saturated, light brown to grey, fine to medium grained beach sand. Shell fragments and seaweed was noted at various locations.
Groundwater flow direction	The calculated groundwater elevations (m AHD) are presented in Table C1 in Appendix C. Groundwater elevations across the base at the time of the sampling event ranged from -0.204 (MW109) to 2.68 m AHD (MW282). The negative groundwater elevation at MW109 is potentially a field error in the recording of the depth to water as elevations have historically ranged from 0.116 – 0.59 m AHD as a result this data point was removed from the groundwater contours shown in Figure 3. Inferred groundwater contours are presented in Figure 3 to Figure 7 in Appendix A. **APPENDIX A** Groundwater flow direction across the base at the time of the sampling event is summarised below. Generally, groundwater flow was towards the coast, with inward flow and mounding in some areas, likely as a result of tidal influence, which is consistent with previous findings. **Fire Training Area** Generally easterly towards the Cockburn Sound, consistent with previous gauging rounds. **Demolition Ground**

Item	Description
	West south-westerly (i.e., inward) groundwater flow, possibly associated with tidal influence from the adjoining Cockburn Sound, consistent with previous gauging rounds. **Wastewater Treatment Plant** Generally easterly flow towards the Cockburn Sound, consistent with previous gauging rounds. **Helicopter Support Facility** Generally westerly towards the Cockburn Sound, consistent with previous gauging rounds. An element of radial flow was evident in the western portion of the area. **Main base area** Generally southerly towards the Cockburn Sound, consistent with previous gauging rounds.
Physicochemical parameters	Water physicochemical parameters are presented in Tables C1, C2 and C3 in Appendix C and are summarised below: **Groundwater** – Temperature ranged from 14.1 ˚C (MW200) to 23.4 ˚C (MW139). – pH ranged from 6.44 (MW142) to 8.38 (MW257) indicating slightly acidic to alkaline conditions. – EC ranged from 425.6µS/cm (MW166) to 42,289µS/cm (MW142) indicating fresh to saline conditions. – TDS ranged from 396.5mg/L (MW139) to 27,482mg/L (MW142) indicating fresh to saline conditions. – DO ranged from 0.6mg/L (MW149) to 9.95mg/L (MW496) indicating poor to well oxygenated conditions. – Redox ranged from -230.2mV (MW141) to 51mV (MW171) and indicated predominantly reducing conditions. **Porewater** – Temperature ranged from 13.6˚C (PW340) to 18.7˚C (PW330). – pH ranged from 7.05 (PW367) to 8.05 (PW308) indicating circum-neutral to alkaline conditions. – EC ranged from 10,486µS/cm (PW346) to 53,782µS/cm (PW330) indicating brackish to saline conditions. – TDS ranged from 6,823mg/L (PW346) to 35,609mg/L (PW380) indicating saline conditions. – DO ranged from 0.08mg/L (PW331) to 8.56mg/L (PW335) indicating very low to well oxygenated conditions. – Redox ranged from -317.2mV (PW331) to 75.1mV (PW329) and indicated predominantly reducing conditions. **Surface water** – Temperature ranged from 14.8 ˚C (SW406) to 23.4˚C (SW152). – pH ranged from 7.9 (SW371) to 8.19 (SW134) indicating alkaline conditions. – EC ranged from 34,005µS/cm (SW416) to 53,489µS/cm (SW310) indicating saline conditions. – TDS (where recorded) ranged from 34,580mg/L (SW150) to 53,443mg/L (SW152) indicating saline conditions. – DO ranged from 4.72mg/L (SW310) to 21.03mg/L (SW383) indicating moderately to well oxygenated conditions. – Redox ranged from -182.7mV (SW311) to 76.2mV (SW154) indicating both reducing and oxidising conditions.

5.3 Summary of Analytical Results

The PFAS analytical results for groundwater, surface water, sediment and porewater from this sampling event are presented in Table C4 to C7 in Appendix C.

5.3.1 Groundwater

60 primary groundwater samples were analysed for PFAS, with:

– 24 samples reporting **PFBS** concentrations above the LOR. Two of these were above the ADWG value (1µg/L), namely MW171 (1.14µg/L) and MW256 (1.87µg/L).

– 37 samples reporting **PFOS** concentrations above the LOR. All of these reported concentrations were above the ADWG value (0.008µg/L), noting that the LOR that was applied is greater than the ADWG value. 23 samples reported PFOS concentrations below the LOR (i.e., <0.01) and it therefore cannot be determined whether PFOS concentrations in these samples were above or below the ADWG value.
– 43 samples reporting **PFHxS** concentrations above the LOR. Of these, 37 samples reported concentrations greater than the ADWG value (0.03µg/L).
– 25 samples reporting **PFOA** concentrations above the LOR. Of these, 11 samples reported concentrations greater than the ADWG value (0.2µg/L).

A summary of groundwater locations where concentrations were greater than those previously reported (i.e., first-time detections or new maximums) is presented as Table 11.

Table 11 Deviations from Historical Dataset – Groundwater Analytical Results

Item	Sample location	PFBS (µg/L)		PFHxS (µg/L)		PFOA (µg/L)		PFOS (µg/L)	
		Sept. 2025	Previous Max.	Sept. 2025	Previous Max.	Sept. 2025	Previous Max.	Sept. 2025	Previous Max.
First-time detection	None	No first-time detections							
New historical maximum	MW120	No new maximum		No new maximum		2.32	2.13	No new maximum	
	MW127	No new maximum		0.03	0.02	No new maximum		0.02	0.007*
First-time guideline exceedance	MW127	No first-time exceedance		No first-time exceedance		No first-time exceedance		0.02	0.007*

*Previous maximum recorded during the DSI (RPS, 2018a) when a lower, non-standard LOR was applied (0.001 µg/L). Concentrations recorded during implementation of the OMP have been below the standard LOR (i.e., <0.01µg/L).

5.3.2 Porewater

In summary, 39 primary porewater samples were analysed for PFAS, with:

– Four samples (PW346, PW375, PW367 and PW369) reporting a **PFOS** concentration above the LOR. All of these reported concentrations that exceeded the aquatic ecosystems guideline value (0.00023µg/L), noting that the LOR that was applied is greater than the aquatic ecosystems value. The remaining 35 samples reported PFOS concentrations below the LOR (i.e., <0.01µg/L) and it therefore cannot be determined whether PFOS concentrations in these samples were above or below the aquatic ecosystems value. All reported concentrations were less than the recreational guideline value (2µg/L).
– Two samples (PW346 and PW368) reporting a **PFHxS** concentration above the LOR. The concentrations were less than the recreational guideline value (2µg/L).
– Five samples reporting a **PFOS+PFHxS** concentration above the LOR. All reported concentrations were less than the recreational guideline value (2µg/L).
– All samples reporting **PFOA** concentrations below the LOR and therefore below the aquatic ecosystems guideline value (19µg/L) and the recreational guideline value (10µg/L).

There were no first-time detections or new maximum PFAS concentrations in porewater samples.

5.3.3 Surface water

28 primary surface water samples were analysed for PFAS, with:

– Four samples (SW305, SW371, SW372 and SW373, associated with the WWTP) reporting a **PFOS** concentration marginally above the LOR (i.e., 0.01 – 0.02µg/L). All of these reported concentrations that exceeded the aquatic ecosystems guideline value (0.00023µg/L), noting that the LOR that was applied is greater than the aquatic ecosystems value. The remaining 24 samples reported PFOS concentrations below the LOR (i.e., <0.01µg/L) and it therefore cannot be determined whether PFOS concentrations in these samples were above or below the aquatic ecosystems value. All reported concentrations were less than the recreational guideline value (2µg/L).

– All samples reporting **PFHxS** and **PFOA** concentrations below the LOR and therefore below the aquatic ecosystems guideline value (19µg/L for PFOA) and the recreational guideline value (2µg/L for PFHxS and 10µg/L for PFOA).

There were no first-time detections or new maximum PFAS concentrations in surface water samples.

5.3.4 Sediment

39 primary sediment samples were analysed for PFAS compounds, with:

– No samples reporting a **PFBS** concentration above the LOR.
– Two samples reporting a **PFOS** concentration above the LOR. This included SD346, associated with the accommodation area, with a concentration of 0.0003 mg/kg and SD345, associated with the WWTP, with a concentration of 0.0002 mg/kg.
– Two samples reporting a **PFHxS+PFOS** concentration above the LOR, with concentrations equal to the PFOS concentrations outlined above (i.e., all samples comprised PFOS only).
– No samples reporting a **PFHxS** concentration above the LOR.
– No samples reporting a **PFOA** concentration above the LOR.

There were no first-time detections or new maximum PFAS concentrations in sediment samples.

6. Summary

6.1 Summary of Monitoring Event

The findings and recommended actions from the September 2025 sampling event are summarised in Table 12.

Table 12 Summary of Sampling Event

Item	Comment	Recommended Action
Access to sampling locations	All locations were accessible apart from MW158 (WWTP area) and MW249 (AVCAT Storage and Fuel Farm area), as described in Section 2.2.	Access to these locations will be sought during future sampling events, with support from base personnel where possible.
Location unable to be sampled, blocked or dry	With reference to Section 2.2, MW195S (WWTP) was blocked and unable to be sampled and MW193 (WWTP) was not sampled due to field error. As noted in Section 5.2, the measured well depth in some monitoring wells suggests sediment may have accumulated within the monitoring wells. The wells were still able to be sampled and the recorded PFAS concentrations were within the historical range.	In both cases, hydraulically down-gradient groundwater monitoring locations were able to be sampled to provide an assessment of risks to the marine environment, which is the primary sensitive receptor for the base. Replacement/repair of blocked well MW195S and wells with accumulated sediment is not recommended as a matter of priority at this time. The forthcoming OMP Revision will review the value of the monitoring well in the context of the OMP objectives and make a recommendation for repair, re-installation or otherwise.
Analytical results	60 groundwater samples, 39 porewater samples, 28 surface water samples and 39 sediment samples were analysed. Concentrations recorded were generally consistent with historical data.	Locations will be sampled again during the next OMP sampling event. Data will be evaluated further within the context of the OMP objectives (refer to Section 1.1) as part of the forthcoming OMR. The requirement to apply a non-standard LOR at selected monitoring locations to inform a suitable risk assessment will be considered as part of the OMR and forthcoming OMP Revision process.
First-time detections of PFBS, PFHxS, PFOA and/or PFOS	No first-time detections were identified during the September 2025 sampling event.	
New historical maximum concentrations	New historical maximum concentrations were reported at groundwater monitoring locations MW120 and MW127. In both cases, the new maximum concentrations were within one order of magnitude of the previous maximum concentrations.	
New exceedance of human health guideline value	A first-time exceedance of the ADWG value for PFOS (0.008µg/L) was identified at groundwater monitoring location MW127. The recorded concentration (0.02 µg/L) is within one order of magnitude of the previous maximum (0.007 µg/L) though is greater than the ADWG value that was revised in June 2025. GHD understands that groundwater is not abstracted on the base for potable or non-potable use. Potable water for Garden Island is supplied from the Rockingham town water supply (GHD, 2025).	
New exceedance of adopted guideline values?	No surface water or porewater locations reported new exceedances of the adopted ecological guideline values for PFOS and/or PFOA. It is noted that the standard LOR that was applied for PFOS is greater than the aquatic ecosystems PFOS value and it therefore cannot be determined whether PFOS concentrations in the surface water and porewater samples were above or below the aquatic ecosystems value. Interpretation of the significance of PFAS concentrations in ecological receptor environments is undertaken with reference to the ERA (RPS, 2018b) and will be considered further in the OMR.	

6.2 Upcoming Sampling Events

The next sampling event is scheduled for March 2026 due to the Department of Defence suspending the December 2025 Sampling Event.

6.3 Upcoming Ongoing Monitoring Report

The next OMR is scheduled to be delivered in Q2 2026, covering data collected from October 2023 to September 2025.

8. Limitations

This report has been prepared by GHD for Department of Defence and may only be used and relied on by Department of Defence for the purpose agreed between GHD and Department of Defence as set out in Section 1.2 of this report.

GHD otherwise disclaims responsibility to any person other than Department of Defence arising in connection with this report. GHD also excludes implied warranties and conditions, to the extent legally permissible.

The services undertaken by GHD in connection with preparing this report were limited to those specifically detailed in the report and are subject to the scope limitations set out in the report.

The opinions, conclusions and any recommendations in this report are based on conditions encountered and information reviewed at the date of preparation of the report. GHD has no responsibility or obligation to update this report to account for events or changes occurring subsequent to the date that the report was prepared.

The opinions, conclusions and any recommendations in this report are based on information obtained from, and testing undertaken at or in connection with, specific sample points. Site conditions at other parts of the site may be different from the site conditions found at the specific sample points.

Investigations undertaken in respect of this report are constrained by the particular site conditions, such as the location of buildings, services and vegetation. As a result, not all relevant site features and conditions may have been identified in this report.

The opinions, conclusions and any recommendations in this report are based on assumptions made by GHD described in this report. GHD disclaims liability arising from any of the assumptions being incorrect.

GHD has prepared this report on the basis of information provided by Department of Defence and others who provided information to GHD (including Government authorities)], which GHD has not independently verified or checked beyond the agreed scope of work. GHD does not accept liability in connection with such unverified information, including errors and omissions in the report which were caused by errors or omissions in that information.

Comments

#1 Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.

***** RPDs have only been considered where a concentration is greater than 1 times the EQL.

****** Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 30 (1 - 10 x EQL); 30 (10 - 30 x EQL); 30 (> 30 x EQL))

******* Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

Comments

Quantification of linear and branched isomers has been conducted as a single total response using the relative response
#1 factor for the corresponding linear/branched standard.

RPDs have only been considered where a concentration is
***** greater than 1 times the EQL.

Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 30 (1 - 10 x
****** EQL); 30 (10 - 30 x EQL); 30 (> 30 x EQL))

Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row
******* header relate to those used in the primary laboratory

Comments

#1 Reported Analyte LOR is higher than Requested Analyte LOR
Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the
#2 corresponding linear/branched standard.

Comments

#1 Reported Analyte LOR is higher than Requested Analyte LOR
Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the
#2 corresponding linear/branched standard.

Comments

#1 Reported Analyte LOR is higher than Requested Analyte LOR
Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the
#2 corresponding linear/branched standard.

Comments

#1 Reported Analyte LOR is higher than Requested Analyte LOR
Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the
#2 corresponding linear/branched standard.

Calibration Report

Multi-Parameter Water Quality Instrument

Customer:
Contact:

Manufacturer: YSI
Instrument: Professional Plus with Quatro cable
Serial #: 20B120527
Cable length: 1m (18K100836)

Item	Test	Pass	Comments
Battery	2 x Alkaline C-cells	✓	Voltage reading above 2.9V
	Battery Saver	✓	Automatically turns off after 30 minutes if not used
Connections	Condition	✓	Good, clean
Cable	Condition	✓	Clean, no tears
Display	Operation	✓	
Firmware	Version	✓	4.0.0
Keypad	Operational	✓	
Display	Screen	✓	
Unit	Condition, seals and O-rings	✓	
Monitor housing	Condition	✓	
pH			
Condition		✓	Good, clean
pH millivolts for pH7 calibration range 0 mV ± 50 mV		✓	
pH 4 mV range + 165 to + 180 from 7 buffer mV value		✓	172.90 mV
pH slope		✓	55 to 60 mV/pH, ideal 59mV 58.55
Response time < 90 seconds		✓	
Calibrated and conforms to manufacturer's specifications		✓	
ORP			
Condition		✓	Good, clean
Response time < 90 seconds		✓	
within ± 80mv of reference Zobell Reading		✓	
Calibrated and conforms to manufacturer's specifications		✓	variance range ± 20mV 4 mV
Conductivity			
Condition		✓	Good, clean
Temperature		✓	°C
Conductivity cell constant 5.0 ± 1.0 in GLP file		✓	
Clean sensor reads less than 3 uS/cm in dry air		✓	
Calibrated and conforms to manufacturer's specifications		✓	µs/cm
Dissolved Oxygen			
Condition		✓	Good, clean
DO sensor in use		✓	Galvanic
1.25 mil PE membrane (yellow membrane):		✓	
DO Sensor Value		✓	(min 4.31 uA - max 8.00 uA) Avg 6.15 uA
Calibrated and conforms to manufacturer's specifications		✓	ppm

This is to certify that the above instrument has been calibrated to the following specifications:

						Instrument Readings

Cable length: 1m 21F100351

Item	Test	Pass	Comments
Battery	2 x Alkaline C-cells	✓	Voltage reading above 2.9V
	Battery Saver	✓	Automatically turns off after 30 minutes if not used
Connections	Condition	✓	Good, clean
Cable	Condition	✓	Clean, no tears
Display	Operation	✓	
Firmware	Version	✓	0.0.78
Keypad	Operational	✓	
Display	Screen	✓	
Unit	Condition, seals and O-rings	✓	
Monitor housing	Condition	✓	
pH			
Condition		✓	Good, clean
pH millivolts for pH7 calibration range 0 mV ± 50 mV		✓	
pH 4 mV range + 165 to + 180 from 7 buffer mV value		✓	173.60 mV
pH slope		✓	55 to 60 mV/pH, ideal 59mV 58.78
Response time < 90 seconds		✓	
Calibrated and conforms to manufacturer's specifications		✓	
ORP			
Condition		✓	Good, clean
Response time < 90 seconds		✓	
within ± 80mv of reference Zobell Reading		✓	
Calibrated and conforms to manufacturer's specifications		✓	variance range ± 20mV 12 mV
Conductivity			
Condition		✓	Good, clean
Temperature		✓	°C
Conductivity cell constant 5.0 ± 1.0 in GLP file		✓	
Clean sensor reads less than 3 uS/cm in dry air		✓	
Calibrated and conforms to manufacturer's specifications		✓	µs/cm
Dissolved Oxygen			
Condition		✓	Good, clean
DO sensor in use		✓	Galvanic
1.25 mil PE membrane (yellow membrane):		✓	
DO Sensor Value		✓	(min 4.31 uA - max 8.00 uA) Avg 6.15 uA
Calibrated and conforms to manufacturer's specifications		✓	ppm

This is to certify that the above instrument has been calibrated to the following specifications:

						Instrument Readings

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Inorganics Analyst	Perth Inorganics, Wangara, WA
[redacted]	SENIOR LAB TECH	Perth Organics, Wangara, WA
[redacted]	Organic Supervisor	Perth Organics, Wangara, WA

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: High LCS recovery deemed acceptable as all associated analyte results are less than LOR for the particular instrument sample run.
- EP231X-LL: LOR has been raised for analyte "PFDS" on sample "EP2515408-021" due to matrix interferences.
- Amendment (24/12/2025): This report has been amended and re-released to allow the reporting of additional analytical data, specifically method EP231X (PFHxDA) for samples EP2515408_001 to 020, 022 to 040, 073 to 122, 125 to 132, 135 to 140, 142 to 145, 147, and 149 to 162; method EP231X-LL (PFNS) for samples EP2515408_021 and 123
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per USEPA 1633 limits where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Analytical Results

Dates

Date Samples Received	: 19-Sep-2025 16:30	Issue Date	: 23-Sep-2025
Client Requested Due Date	: 02-Oct-2025	Scheduled Reporting Date	: **02-Oct-2025**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Intact.
No. of coolers/boxes	: 4	Temperature	: 2.4 - Ice present
Receipt Detail	:	No. of samples received / analysed	: 160 / 160

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Please see scanned COC for sample discrepencies: extra samples , samples not received etc.
- Please direct any queries related to sample condition / numbering / breakages to Sample Receipt (Samples.Perth@alsglobal.com)
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Perth, NATA accreditation no. 825, site no. 15847.
- Please direct any turnaround / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **pH analysis should be conducted within 6 hours of sampling.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **If Scheduled Reporting Date shown above is earlier than Client Requested Due Date, this reflects the date that a preliminary report is scheduled to be issued. Client Requested Due Date reflects the date that the final report is to be issued.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Telephone	: ----	Telephone	: +61-8-9406 1301
Project	: WA_0089_PFASOMP_25	Date Samples Received	: 19-Sep-2025
Order number	: 12641234/02.2.6	Date Analysis Commenced	: 24-Sep-2025
C-O-C number	: 88337	Issue Date	: 29-Dec-2025
Sampler	: [redacted]		
Site	: WA_0089_PFASOMP_25		
Quote number	: EP24GHDSER0016_V5		
No. of samples received	: 160		
No. of samples analysed	: 160		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Inorganics Analyst	Perth Inorganics, Wangara, WA
[redacted]	SENIOR LAB TECH	Perth Organics, Wangara, WA
[redacted]	Organic Supervisor	Perth Organics, Wangara, WA

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Contact	: [redacted]	Telephone	: +61-8-9406 1301
Project	: WA_0089_PFASOMP_25	Date Samples Received	: 19-Sep-2025
Site	: WA_0089_PFASOMP_25	Issue Date	: 29-Dec-2025
Sampler	: [redacted]	No. of samples received	: 160
Order number	: 12641234/02.2.6	No. of samples analysed	: 160

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*	
Laboratory Duplicates (DUP)

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. A portion of homogenised sample is extracted along with isotope dilution standards (where commercially available) in a solution of ammonium acetate in acetonitrile/methanol. Where relevant, interferences from co-extracted organics are removed using dispersive clean-up media (dSPE). A portion of extract is combined with an equal volume of reagent water and filtered for instrumental analysis.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction (SPE) followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. Isotope dilution standards (where commercially available) and surrogates are added to the sample container. The entire contents are transferred to a weak anion exchange (WAX) solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Data quality objectives for internal standard recoveries are based on US EPA method 1633.
Per- and Polyfluoroalkyl Substances (PFAS by LCMSMS	EP231X-LL	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction (SPE) followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. Isotope dilution standards (where commercially available) and surrogates are added to the sample container. The entire contents are transferred to a weak anion exchange (WAX) solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Data quality objectives for internal standard recoveries are based on US EPA method 1633.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	* ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
Solid Phase Extraction (SPE) for PFAS in water	* ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Inorganics Supervisor	Perth Inorganics, Wangara, WA
[redacted]	Organic Supervisor	Perth Organics, Wangara, WA

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: LOR has been raised for particular analytes on certain samples due to matrix interference.
- Amendment (24/12/2025): This report has been amended and re-released to allow the reporting of additional analytical data, specifically method EP231X (PFHxDA) for samples EP2515823 _001 to 019 and 026 to 045
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per USEPA 1633 limits where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

No. of coolers/boxes	: 1	Temperature	: 3.0
Receipt Detail	:	No. of samples received / analysed	: 44 / 44

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Please see scanned COC for sample discrepencies: extra samples , samples not received etc.
- Please direct any queries related to sample condition / numbering / breakages to Sample Receipt (Samples.Perth@alsglobal.com)
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Perth, NATA accreditation no. 825, site no. 15847.
- Please direct any turnaround / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **pH analysis should be conducted within 6 hours of sampling.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **If Scheduled Reporting Date shown above is earlier than Client Requested Due Date, this reflects the date that a preliminary report is scheduled to be issued. Client Requested Due Date reflects the date that the final report is to be issued.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

[redacted]	Organic Supervisor	Perth Organics, Wangara, WA

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **SOIL**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sampler	: [redacted]	No. of samples received	: 44
Order number	: 12641234/02.2.6	No. of samples analysed	: 44

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **Analysis Holding Time Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries

Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	2	48	4.17	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. A portion of homogenised sample is extracted along with isotope dilution standards (where commercially available) in a solution of ammonium acetate in acetonitrile/methanol. Where relevant, interferences from co-extracted organics are removed using dispersive clean-up media (dSPE). A portion of extract is combined with an equal volume of reagent water and filtered for instrumental analysis.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction (SPE) followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. Isotope dilution standards (where commercially available) and surrogates are added to the sample container. The entire contents are transferred to a weak anion exchange (WAX) solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Data quality objectives for internal standard recoveries are based on US EPA method 1633.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	* ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
Solid Phase Extraction (SPE) for PFAS in water	* ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
% Moisture	Welshpool	Sep 19, 2025	14 Days
- Method: ARL135 Moisture in Solids			
Perfluoroalkyl carboxylic acids (PFCAs)	Welshpool	Sep 22, 2025	28 Days
- Method: Method ARL0510_ARL0511 PFAS in aqueous & solid samples by LC-MS/MS			
Perfluoroalkyl sulfonamido substances	Welshpool	Sep 22, 2025	28 Days
- Method: Method ARL0510_ARL0511 PFAS in aqueous & solid samples by LC-MS/MS			
n:2 Fluorotelomer sulfonic acids (n:2 FTSAs)	Welshpool	Sep 22, 2025	28 Days
- Method: Method ARL0510_ARL0511 PFAS in aqueous & solid samples by LC-MS/MS			
Perfluoroalkyl sulfonic acids (PFSAs)	Welshpool	Sep 22, 2025	28 Days
- Method: Method ARL0510_ARL0511 PFAS in aqueous & solid samples by LC-MS/MS

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Method Blank							
Perfluoroalkyl carboxylic acids (PFCAs)

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	N/A
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Perfluoroalkyl carboxylic acids (PFCAs)	Welshpool	Sep 22, 2025	28 Days
- Method: Method ARL0510_ARL0511 PFAS in aqueous & solid samples by LC-MS/MS

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram	**mg/L:** milligrams per litre	**ppm:** parts per million
µg/L: micrograms per litre	**ppb:** parts per billion	**%:** Percentage
org/100 mL: Organisms per 100 millilitres	**NTU:** Nephelometric Turbidity Units	**MPN/100 mL:** Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit	**Colour:** Pt-Co Units (CU)	

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Sample containers for volatile analysis received with minimal headspace	N/A
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
J-	If the percent recoveries were less than the lower control limit, qualify detects for the analyte in associated samples as estimated with a negative bias J-.
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Eurofins reference 1270698

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 12 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
N/A	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Perfluoroalkyl carboxylic acids (PFCAs)	Welshpool	Sep 30, 2025	28 Days
- Method: Method ARL0510_ARL0511 PFAS in aqueous & solid samples by LC-MS/MS			
Perfluoroalkyl sulfonamido substances	Welshpool	Sep 30, 2025	28 Days
- Method: Method ARL0510_ARL0511 PFAS in aqueous & solid samples by LC-MS/MS			
n:2 Fluorotelomer sulfonic acids (n:2 FTSAs)	Welshpool	Sep 30, 2025	28 Days
- Method: Method ARL0510_ARL0511 PFAS in aqueous & solid samples by LC-MS/MS			
Perfluoroalkyl sulfonic acids (PFSAs)	Welshpool	Sep 30, 2025	28 Days
- Method: Method ARL0510_ARL0511 PFAS in aqueous & solid samples by LC-MS/MS

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. Unless otherwise stated, all soil/sediment/solid results are reported on a dry weight basis.
3. Unless otherwise stated, all biota/food results are reported on a wet weight basis on the edible portion.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds where annotated.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with **blue** colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the sampling date; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is seven days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
ppm: parts per million
µg/L: micrograms per litre
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony Forming Unit
Colour: Pt-Co Units (CU)

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 6.0
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 50 – 150%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 6.0, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Method Blank

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
J-	If the percent recoveries were less than the lower control limit, qualify detects for the analyte in associated samples as estimated with a negative bias J-.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Sample Receipt Advice

Company name: GHD Pty Ltd WA
Contact name: - ALL GHD lab reports
Project name: Not provided
Project ID: WA_0089_PFASOMP_25
Turnaround time: 5 Day
Date/Time received Sep 25, 2025 2:00 PM
Eurofins reference 1273096

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	Sample Temperature of chilled sample on the batch as recorded by Eurofins Sample Receipt : 8.1 degrees Celsius.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
X	Split sample sent to requested external lab.
X	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

[redacted] **on phone : or by email:** [redacted]**eurofinsanz.com**

Results will be delivered electronically via email to - ALL GHD lab reports - ghd.labreports@ghd.com.

Note: A copy of these results will also be delivered to the general GHD Pty Ltd WA email address.

Summary of RCIP studies

RCIP PFAS investigation outcomes

Study	Area	Assessed by PFAS DSI?	Key findings regarding PFAS	Recommendations regarding PFAS
RCIP DSI (GHD, 2020)	Torpedo Maintenance Explosive Area (CSR_WA_000020 & CSR_WA_000231) 	No	– PFOS was recorded in groundwater collected from a single monitoring well (MW095) at the Torpedo Maintenance Explosive Area at a concentration of 0.19 ug/L (greater than the PFAS NEMP interim 99% marine species protection criterion of 0.00023 ug/L). – It was noted that the recorded concentrations were less than the 95% upper confidence limit (UCL) concentration recorded for the groundwater data set for other areas investigated in the PFAS DSI, suggesting the recorded concentrations were representative of regional PFAS characteristics.	-
	Torpedo Maintenance Facility – D21 (CSR_WA_000124, CSR_WA_000227 & CSR_WA_000028) 	No	– PFOS was recorded in groundwater at a single monitoring well (MW092) at the Torpedo Maintenance Facility – D21 at a concentration of 0.02 ug/L (greater than the PFAS NEMP interim 99% marine species protection criterion of 0.00023 ug/L). – It was noted that the recorded concentrations were less than the 95% UCL concentration recorded for the groundwater data set for other areas investigated in the PFAS DSI.	-
	Ship Sullage Facility - UST_057 and UST_058 (CSR_WA_000240) 	Yes	– PFAS was identified in groundwater at the Ship Sullage Facility, which includes two sullage underground storage tanks (USTs) that have been the subject of multiple overflow and spill events. PFAS assessment was undertaken as part of assessment of groundwater quality post redevelopment of the area, and in conjunction with investigations to further delineate a hydrocarbon plume. The following was noted regarding PFAS: • The recorded PFOS groundwater concentrations at three monitoring wells (MW325, MW331 and MW481), ranging from 0.03 to 0.16 ug/L, exceeded the PFAS NEMP interim 99% marine species protection criterion (0.00023 ug/L). It was noted that the PFOS concentrations recorded were comparable to those previously reported (RPS 2018a) and were therefore not considered to warrant further investigation. • The recorded PFOS + PFHxS concentration of 3.44 ug/L at one monitoring well (MW331) exceeded both the PFAS NEMP drinking water (0.07 ug/L) and recreational water use criteria (0.7 ug/L). It was noted that PFOS + PFHxS concentrations at the down-gradient monitoring well were below the NEMP recreational water use criterion.	Consideration to include monitoring of PFAS in groundwater in the area as part of the OMP was recommended.

Study	Area	Assessed by PFAS DSI?	Key findings regarding PFAS	Recommendations regarding PFAS
	Building 54 - Group of USTs Oil (CSR_WA_000241) 	No	– PFAS was identified in groundwater at the Building 54 Group of USTs, which includes three USTs that have been the subject of multiple overflows and spill events. PFAS assessment was undertaken in conjunction with investigations to further delineate a hydrocarbon plume. The following was noted regarding PFAS: • The recorded PFOS concentrations in groundwater at five monitoring wells (MW006, MW483, MW484, MW486 and MW515), ranging from 0.04 to 32.2 ug/L (at 0089_MW486), exceeded the PFAS NEMP interim 99% marine species protection criterion of 0.00023 ug/L. • The recorded PFOS + PFHxS concentrations at four monitoring wells (MW006, MW483, MW486 and MW515), ranging from 1.3 to 35.6 ug/L, exceeded the PFAS NEMP recreational water use criterion of 0.7 ug/L. • It was noted that concentrations at the down-gradient monitoring well were three orders of magnitude greater than those recorded in the up-gradient well, indicating that the area is/was contributing to PFAS groundwater impacts. The recorded concentrations were also noted to be two orders of magnitude greater than those identified by the PFAS DSI (RPS 2018a) in the area (0.73 ug/L). – Due to the proximity of the area to Careening Bay, it was considered that the recorded PFAS concentrations may pose an unacceptable risk to ecological receptors of the marine environment. It was recommended that the concentrations be considered in the context of the ERA to determine if further action is warranted.	Due to the proximity of the area to Careening Bay, it was considered that the recorded PFAS concentrations may pose an unacceptable risk to ecological receptors of the marine environment. It was recommended that the concentrations be considered in the context of the ERA to determine if further action is warranted.
RCIP Stage 2 DSI (GHD, 2024a) RCIP Addendum Stage 2 DSI (Wastewater Treatment Plant [WWTP]) **(GHD, 2025a)** Saline Stream WWTP Contamination Risk Assessment	Sewage Treatment Plan (proposed by RCIP to be re-named “Wastewater Treatment Plant”) (CSR_WA_000128) 	Yes	**Supplementary WWTP investigation** – The Addendum Stage 2 RCIP DSI and subsequent saline stream WWTP risk assessment identified PFAS in soil and groundwater at and down-gradient of the WWTP seepage ponds at concentrations greater than measured background concentrations. – PFOS concentrations in soil exceeded the HEPA (2020) indirect ecological exposure criterion. PFOS + PFHxS concentrations in groundwater exceeded HEPA (2020) human health recreational water criteria, indicating a potential risk to recreational users of the Indian Ocean to the west of the ponds. – The spatial correlation of elevated PFAS concentrations in groundwater proximal to the seepage ponds, as well as the similarities in PFAS composition between the groundwater and soil samples, supported that the seepage ponds are likely an ongoing source of PFAS to groundwater.	GHD (2024c) recommended completion of an engineering design review to inform necessary upgrades to WWTP design, capacity and processes to seek to ensure that effluent is always fully treated to an acceptable quality prior to discharge to the seepage ponds.

Study	Area	Assessed by PFAS DSI?	Key findings regarding PFAS	Recommendations regarding PFAS
(GHD, 2024b)			– PFOS concentrations in marine porewater and surface water hydraulically down-gradient of the WWTP were greater than the HEPA (2020) marine water 99% ecological criterion. A fauna assessment was conducted to support an assessment of the likelihood of unacceptable PFOS exposure occurring to or via consumption of infauna (i.e., animals living in the sediments of the ocean floor, from which the porewater samples were collected). The findings of the assessment indicated that there appears to be a low risk of exposure of aquatic invertebrates to PFAS via direct contact, and higher trophic level marine species to PFAS through bioaccumulation within the study area, however this was based on limited data. – PFAS concentrations in porewater and surface water appeared to reduce to below levels that would be of concern for human health in the context of recreational use of the Indian Ocean west of the WWTP and seepage ponds. **Saline Stream WWTP Contamination Risk Assessment** A Technical Memorandum was prepared after concerns were raised regarding whether the saline WWTP was adequately designed to manage current effluent volumes without posing a contamination risk to the environment, following the identification of design capacity exceedances. The objectives of the assessment were to: – Identify and investigate potential sources and impacts of contamination associated with saline WWTP operations including overdesign flows and potential over-flows of nutrient rich wastewater. – Assess contamination risk associated with current saline WWTP operations. – Identify if the bypass of partially treated effluent through the Saline WWTP adversely affects the environment in comparison with treated saline effluent stream. – Provide recommendations regarding the need for an engineering design review of the saline WWTP. The assessment found that under the current design capacity, the saline WWTP does not have the capacity to treat the effluent volumes regularly required to be managed, which results in partially treated effluent being released to the environment via unlined seepage ponds. This review has concluded that under current processes, WWTP discharges are causing increasing trends in nutrient concentrations in groundwater and an unacceptable nutrient load to the environment.	GHD (2024c) recommended that the design review also consider PFAS treatment, in the context of broader PFAS risk assessment and management, to ensure that PFAS concentrations in effluent are discharged at a concentration that does not pose a risk to identified receptors, acknowledging that currently the saline WWTP does not treat PFAS.

Study	Area	Assessed by PFAS DSI?	Key findings regarding PFAS	Recommendations regarding PFAS
RCIP Stage 2 DSI (GHD, 2024a)	Joint Logistics Unit (West) Area (Buildings B0007, B0095, B0058) (CSR_WA_000362) 	No	– PFAS was detected at concentrations above the LOR in soil samples collected from 3 of 7 soil bores. The concentrations did not exceed the adopted soil assessment criteria. – PFAS was detected at concentrations above the LOR in groundwater at three of five monitoring wells sampled. Concentrations exceeded the PFAS NEMP interim marine criteria at two monitoring wells (MW547 and MW548). – A PFAS plume in groundwater was confirmed to extend beneath the CSR towards the southeast, towards Careening Bay. The extent of the PFAS plume was not confirmed. Additional investigation and monitoring of groundwater was recommended, including addition of the area to the OMP.	Additional investigation and monitoring of groundwater was recommended, including addition of the area to the OMP. Sampling and analysis for PFAS in the stormwater/drainage system of the CSR was recommended to better understanding PFAS migration within/from the CSR.
	Stockpiled material of an unknown source (CSR_WA_000364) 	No	– PFAS was detected at concentrations above the LOR in 2 of 10 soil samples collected from the stockpiled material. – Further consideration of the contamination status of the stockpiled soils within this CSR was not considered to be required.	GHD considered that the material can either be disposed off-site to a licenced landfill as Class I contaminated soil, or if retained on-Site, can be used as capping material or in construction (such as, beneath concrete slabs or road reserves).
