Executive summary

Background

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the per-and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP). The OMP is outlined in the PFAS Management Area Plan (PMAP) developed for the Royal Australia Air Force (RAAF) Base Tindal ('the base'), Northern Territory (NT). The PMAP was first published by Defence in 2019 and revised in 2025.

Objective

The objective of implementing the OMP is to provide information on changes in the location and concentrations of PFAS in groundwater, surface water and selected biota (fish and crustaceans) on-base and off-base in and around the Management Area. The data are used to assist risk management decisions by Defence to protect human health and the environment, and to inform the understanding of the effectiveness of remedial actions.

Monitoring program

AECOM completed monitoring of groundwater, surface water, fish and crustaceans between June 2024 and May 2025. The monitoring targeted PFAS at 50 groundwater wells, 13 surface water locations and two aquatic biota locations off-base.

Interpretive assessment

Data collected during the monitoring period were compared to historical data collected since 2017[1] at the nominated sampling locations.

Groundwater results

Groundwater monitoring data indicated that groundwater flows to the west across the base and continues westwards towards Katherine River, consistent with historical data. Groundwater continues to discharge into the Katherine River through seeps and preferential pathways within the Tindall Limestone Aquifer[2].

What is an 'order of magnitude'?

This refers to a number decreasing or increasing by multiples of ten. For instance, an increase from 10 to 100 is an order of magnitude increase. When assessing changes in PFAS concentrations at an individual location, all concentrations are considered when determining trends, but order of magnitude changes are discussed separately as they represent a significant change in concentrations from what was reported in the previous event.

If a change is close to established health or environmental criteria, it will also be considered significant.

The reported concentrations of PFAS in groundwater east of the Katherine River are within the same order of magnitude as historical results and show the current extent of PFAS contamination. The results suggest that the plume size is unchanged, except for Cossack, west of Katherine River, where the plume may be intermittently migrating westward during the wet season, and along the northern plume boundary east of Katherine River. In addition, there is evidence of localised contraction of the PFAS plume beneath the FTA likely in response to the completion of the soil remediation works.

The following were observed:

- Data collected over the monitoring period indicated that the PFAS groundwater plume is seasonally influenced. Locations in Cossack at the leading edge of the plume reported higher PFAS concentrations during the end of wet season.
- Groundwater data collected over the monitoring period reported detections at or marginally greater than the adopted drinking water criteria in Cossack generally during peak wet season. It is noted that the utilisation of low-level PFAS analysis, where PFAS is detected at lower concentrations than the standard method employed under the previous OMP, has resulted in some locations

[1] PFOS and PFOA and 6:2 FtS have been monitored in groundwater (at one location) and surface water (at three locations) since 2014.
[2] An aquifer is an underground layer of porous and permeable rock, gravel, sand or silt, which can contain or transmit groundwater that lies within the geology below the base.

reporting PFAS detections for the first-time, further expanding the area of PFAS contaminated groundwater. Based on geologically (Jinduckin Formation confining layer) induced groundwater flow patterns (i.e. reversal of hydraulic gradients away from the River) and the spatial distribution of measured PFAS concentrations, PFAS groundwater migration within Cossack occurs because of the westward migration of the PFAS from Katherine River during high flow (wet season). The extent of westward intrusion of River-derived groundwater is dependent on the stage of the River.

- PFAS-impacted groundwater regularly discharges into Katherine River. The concentrations of PFAS recorded during the end of dry season were higher than during wet season, when surface water runoff is a greater contributor to river flow.
- The Fire Station Area (FSA) and Fire Training Area (FTA) have undergone remediation works (soils / infrastructure groundwater). PFAS groundwater results downgradient of the FTA collected during the monitoring period show initial signs that PFAS movement from the FTA through groundwater is reducing. Due to the apparent seasonal variation in PFAS concentrations, further monitoring is required to determine the influence of the works in reducing surface water and groundwater concentrations at, and downgradient of the two key source areas.
- Base operation of the two on-base PFAS water treatment plants continue to remove PFAS from groundwater. New wellfields have been installed at both the FSA and FTA to improve the treatment plant performance and to decrease PFAS discharge from the base towards the Katherine Township and Katherine River.

Surface water results

- PFAS concentrations have decreased in Tindal Creek at the base boundary since soil remediation works at the FSA and FTA were completed. Recent soil movement between the FSA and the base runway may have temporarily increased recorded surface water PFAS concentrations.
- No changes in PFAS concentrations were observed in the Katherine River or Katherine Hot Springs over the monitoring period.
- No testing for PFAS occurred at the Katherine Community Swimming Pool during the monitoring period as the pool is currently undergoing renovations and is closed to the public. Testing will resume once the pool is reopened.

Aquatic biota results

Results for aquatic biota collected from the Katherine River during the monitoring period remain similar to previous conditions. Results from continued monitoring will be used to keep health advisory notices regarding aquatic biota consumption posted by the Northern Territory Department of Health up to date.

CSM and risk profile

The conceptual site model (CSM) describes the PFAS sources, pathways and receptors within the Management Area. The CSM was reviewed to incorporate the monitoring data collected between June 2024 and May 2025. This revision of the CSM considered the following:

- **PFAS remediation at the FTA and FSA:** It is anticipated that continued decreases in PFAS concentrations in surface water and groundwater will be observable in the short to long-term (i.e. reduced mass discharge) resulting from soil remedial works undertaken.
- **Seasonal influence on PFAS concentrations in groundwater:** During the wet season, groundwater elevations increase on-base to levels that interact with PFAS in soil at key source areas. Seasonal saturation of PFAS impacted soils in source areas frees PFAS compounds from soil particles and contributes to PFAS in groundwater. Currently, there is not enough data to understand the seasonal impact this interaction has on PFAS concentrations in groundwater throughout the Management Area.
- **Receptor exposure:** Westward migration of the PFAS plume into Cossack and northward east of Katherine River resulted in concentrations that exceed drinking water criteria in these areas. These areas currently include the use of private drinking water and irrigation bores. With revised drinking water guideline values (NHMRC, 2025) adopted for assessment, a revision of potential receptor exposure pathways is warranted, particularly for groundwater users.

While the current CSM adequately describes the sources, pathways and receptors within the Management Area, additional investigation is being conducted to better predict how individual bores within Cossack respond to changing conditions during the wet and dry seasons and the potential expansion of the PFAS plume further to the west of the Management Area.

In summary, new historical maximums have been detected on and off-base within this monitoring period. These are typically within the same order of magnitude as historical results. Future monitoring under the OMP is required to evaluate seasonal variations and the potential for plume migration to the west and north of the Management Area.

Changes in PFAS concentrations reported in groundwater, surface water and aquatic biota will continue to be evaluated through future monitoring and reporting. No new source of PFAS contamination or transport pathways were identified during the reporting period.

Conclusions

The following conclusions are based on the data collected during the monitoring period:

- The monitoring conducted over the current period has met the objectives of the OMP.
- The findings of the interpretive analysis were consistent with the risk profile for the Management Area. However, there is evidence of a potential change in risk in locations within and west of the Management Area in Cossack, west of Katherine River, and in the vicinity of the northern plume boundary east of Katherine River. PFAS concentrations in groundwater have been observed in locations not previously detected and / or above the drinking water criteria or have reported new maximum concentrations.
- Adoption of the revised drinking water guideline values has increased the detection and exceedance of PFAS along the plume boundary to the west and north, potentially changing the risk at additional properties within Cossack.
- Reported PFAS concentrations in surface water continue to be observed at lower concentrations than pre-soil remediation reported concentrations the base boundary within Tindal Creek, corresponding to soil remediation actions at the FSA and FTA.
- The groundwater monitoring network does not sufficiently examine the extent of the northern plume boundary, however, this area is undeveloped land and the risk to individual bore users remains low.

Ongoing monitoring of groundwater and surface water as part of the OMP (Defence, 2021b), which is currently being amended, will continue to monitor the nature and extent of PFAS, potential migration and associated changes to the risk profile.

1.0 Introduction

1.1 Preamble

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the per-and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP), (Defence, 2025a) at RAAF Base Tindal ('the base'), Northern Territory (NT) (**Figure F1** in **Appendix A**) which includes preparation of this Ongoing Monitoring Report (OMR). The monitoring undertaken over a one-year period (2024 – 2025), targeted the measurement of PFAS concentrations in a range of environmental media at selected locations on-base and in surrounding off-base areas as defined in the OMP (locations shown on **Figure F2** to **Figure F5**, **Appendix A**). The environmental media sampled and analysed comprised of surface water, groundwater and biota.

In order to meet the objectives of the OMP, the monitoring was undertaken in accordance with the base *Sampling Analysis and Quality Plan* (SAQP) relevant at the time of sampling (Revision 6 and Revision 0), developed and updated by AECOM (AECOM, 2023) (AECOM, 2025a). The most recent version, Revision 0 (AECOM, 2025a) is provided in **Appendix B** and includes consideration of data collected during other projects implemented under the base's PFAS Management Action Plan (PMAP) (Defence, 2025b), in addition to the OMP scope.

This OMR has been prepared in accordance with the Ongoing Monitoring Program Reporting Guidance (Defence, 2024) and is based on monitoring data collected during a 12-month period, with data actively collected between June 2024 and May 2025. It is noted that the data collected in concurrent programs of work delivered by Defence, outside of this current monitoring period, were also used to further refine the understanding of the conceptual site model (CSM) for the base and Management Area. A summary of relevance of these ancillary works to the OMP, is presented in **Section 6.0**.

The overarching objective of the OMP (Defence, 2025a) is to provide information on changes in the nature and extent of PFAS within the environment on-base and in surrounding areas off-base, in and towards Katherine Township and in the Katherine River. The Management Area is presented in **Figure F1** in **Appendix A**. The data are also required to identify potentially elevated risks to receptors, or potential future receptor risks and to assist in risk management decisions by Defence and Territory Government authorities to protect human health and the environment, and to inform the understanding of the effectiveness of remedial actions.

1.2 OMR purpose

The OMR is a critical resource to communicate and inform key stakeholders, including the local community, on the findings and outcomes of PFAS investigation related activities and associated monitoring results in and surrounding the base.

Assessing changes in the distribution, concentration, and transport (pathways and flux) of PFAS impacts against appropriate guideline values provides an:

- Evidence base for targeted and effective risk management decision making to protect human health and environmental receptors
- Early warning that additional management of PFAS contamination may be required to address first time presence of PFAS in areas not previously understood to be affected by PFAS.

In summary, the monitoring data has been evaluated to assess environmental variability, trends in PFAS concentrations and changes to the known risk profile, to inform review recommendations for the periodic update of the OMP (Defence, 2025a) and PMAP (Defence, 2025b).

1.3 Scope

The scope of work for this OMR includes the assessment of nature and distribution of PFAS concentrations, based on data collected over the preceding 12-month period (May 2024 to April 2025) under the OMP and other base investigations. This includes the evaluation of data reported during the monitoring period in the following OMP factual reports provided in **Appendix B**:

- RAAF Base Tindal – Dry Season Sampling Events Report (SER) 2024 (AECOM, 2025b)
- RAAF Base Tindal – Start of Wet Season SER 2024 – 2025 (AECOM, 2025c)
- RAAF Base Tindal – End of Wet Season SER 2025 (AECOM, 2025d).

2.0 Site setting

2.1 Site description

Table 1 summarises the base identification and setting presented in the PMAP (Defence, 2025b).

Table 1 Site identification and setting summary

Element	Description
Site ID	0990, RAAF Base Tindal
Location	The base is located within a rural, agricultural, and natural land setting, approximately 15 km east of the township of Katherine and accessed by Stuart Highway as shown in **Figure F1** in **Appendix A**. The Katherine Township is the fourth largest urban area in the NT with a population of 9,643 (2021) (Australian Bureau of Statistics, 2021). The town is set on the banks of the Katherine River with residential areas spread along the banks up and down Stuart Highway bridge, predominantly on the eastern side of the river.
Regional climate	The climate of the Katherine region is distinguished by a wet (monsoonal) season and the dry season. The wet season normally lasts from October/November to March/April, and consists of periodic heavy rains in hot and humid conditions with an annual average rainfall of 1063 mm. The dry season normally lasts from April/May to September/October, which consists of mild to hot and mostly rainless weather.
Topography, geology and hydrogeology	The base is situated upon a flat landscape with some minor undulations, rocky outcrops and sub-terranean depressions or sinkholes, which can result in direct connectivity between surface and groundwater. The flat topography of the base reflects the gradient of the wider region. On-base ground elevations range between 130 and 140 metres relative to the Australian Height Datum (m AHD). The township of Katherine and the base are located within the geological formation known as the Daly River group, consisting of Cretaceous sediments, Junduckin Formation of siltstone/sandstone, the Tindall Limestone Aquifer and early to Pre-Cambrian bedrock. The Junduckin Formation overlies the Tindall Limestone Aquifer to the southwest of the base, becoming a confining layer and restricting recharge. The geology was formed in shallow water in the subsiding Daly River basin. The rocks of the Tindall Limestone unit have gentle depositional dips with ‘slump structures’ and minor faults. The Tindall Limestone Aquifer provides high yields of water suitable for multiple uses, including drinking water. The Tindall Limestone Aquifer is unconfined within the base and township area with preferential flows that are a result of the karst nature of the aquifer. Whilst localised vertical groundwater flow will be dependent upon the different matrices, fractures and conduit permeability present, lateral groundwater flow direction is predominantly within the subject area is westerly towards the Katherine River. It is noted that previous investigations conducted within the PFAS Management Areas has indicated that the Tindall Karst Aquifer has complex characteristics due to the high heterogeneity of hydraulic properties and is therefore difficult to model and predict. Groundwater elevations within the Tindall Limestone Aquifer in the project area range between 90 and 130 m AHD.

Element	Description
Surface water	The Katherine and Tindal districts are drained in the east by tributaries of the Roper River and in the west by tributaries of the Daly River. The main surface water drainage on-base is Tindal Creek. Tindal Creek flows from the eastern portion of the base, passing south of the runway, crossing the Stuart Highway twice and entering the Katherine River downstream of the township. Tindal Creek is ephemeral and does not typically flow between May and November (the dry season). Waterholes are present across the area but only hold water for a short period of time after the wet season. Katherine River is perennial and receives surface and groundwater from the localised area, including the base, and is therefore a receptor of PFAS contamination sourced from the base.
Vegetation	The terrestrial environment surrounding the base consists of large areas of bushland and open forest, with the majority characterised by Darwin box and/or bloodwoods woodland with sorghum, white grass, and tussock grasses. Many of the savannah grasses are shallow rooted annuals that grow in response to rainfall. Fruiting and flowering trees and plants are present in the riparian areas. Patches of irrigated grass lawns are found in the landscaped areas at the base. To the west of the base are small scale mango farms, rural residential properties and a quarry.
Current and previous land use (including AFFF use)	Katherine's previous and current land uses are characterised by a combination of residential, educational, commercial and recreational areas which dominate the Katherine Township and directly adjoining lands. Agricultural land uses, predominantly pastoral livestock grazing, grains and fruit crops, extend along the Stuart Highway to the east and pastoral livestock land to the north and south of the highway. The Cutta Cutta Caves Nature Park is a classic example of a Karst landscape and is located directly southeast of the base and adjoins the base on the south-eastern boundary. There is another small portion of private pastoral property to the south adjoining the base and nature park. RAAF Base Tindal was formally established in 1988 as a home base for the No.75 Squadron. Since its inception as 'Carson Airfield' in 1942, the base has undergone multiple extensions and transformations between the 1950s and 1970s. The base is currently undergoing large scale redevelopment and construction programs to modernise and increase capacity of its current facilities to meet Defence alliance requirements. Uncontrolled and controlled discharge of Aqueous Film Forming Foams (AFFF) during handling and storage for both training and formal applications have been carried out historically at the base (Coffey, 2018a). The use of AFFF on-base were predominantly at six on-base locations which were designated by Coffey (Coffey, 2018a) as either a Confirmed or Likely PFAS presence and now are listed within Defence's Contaminated Sites Register (CSR). These six source areas are listed in **Section 2.3** below.

2.2 PFAS management area

The PFAS Management Area consists of on-base source areas and off-base receptors, where management actions, including those where institutional controls have been adopted, or are identified / planned for action and / or will be managed in accordance with the PMAP (Defence, 2025b), as identified in the HHRA (Coffey, 2018c). The PFAS Management Area comprises five key Management Zones which are monitored for changes in PFAS impact and / or receptor exposure, these extend into the Katherine Township and are outlined below:

- **Zone 1**: Groundwater PFAS concentrations greater than drinking water and recreational water criteria
- **Zone 2**: Groundwater PFAS concentrations greater than drinking water criteria
- **Zone 3**: Katherine River: water downstream of surface water monitoring location SW110
- **Zone 4**: Town water supply (Power & Water): includes treated bore water and water from Katherine River
- **Zone 5**: Groundwater PFAS concentrations less than drinking water criteria.

Each Management Zone has tailored precautionary advice for residents to minimise exposure to PFAS. The PFAS Management Area Zones 1, 2 and 5 are shown on **Figure F1** (**Appendix A**).

2.3 Source areas

The PMAP (Defence, 2025b) identified the following six on-base PFAS contamination source areas, as shown on **Figure F1** (**Appendix A**):

- Former Fire Training Area (FTA): PFAS present in soil, groundwater, and surface water.
- Fire Station Area (FSA): PFAS present in soil, groundwater, and surface water.
- Mechanical Equipment Operations Maintenance Section (MEOMS) comprising Vehicle and Equipment maintenance areas: Confirmed low concentrations of PFAS present in groundwater and interceptor drains.
- Fuel Farm 1: Confirmed low concentrations of PFAS present in groundwater and retention pond.
- Fuel Farm 2: Confirmed low concentrations of PFAS present in groundwater and retention pond.
- Solid wastes in the on-base Sewage Treatment Plant (considered to be minor contributions to overall mass).

Additional investigation at four of the source areas confirmed that these were not key or significant sources requiring further remediation (Coffey, 2018b). However, it is noted that remediation of PFAS impacted soil has been conducted at two source areas:

- FSA (completed): remedial works were conducted between July 2022 and July 2023. Remedial works comprised the excavation and on-Base treatment and reuse of PFAS impacted soils.
- Former FTA (completed): remedial works were conducted between August 2022 and November 2024. Remedial works comprised the excavation and on-Base treatment and reuse of PFAS impacted soils, with some soils with combined Perfluorooctanesulfonic acid (PFOS) and Perfluorohexanesulfonic acid (PFHxS) concentrations greater than 20 mg/kg removed from site for destruction. The laydown area north of the remediation extent was resurfaced with topsoil and hydroseeded during the dry season to prevent erosion and water pooling.

Additional information regarding remedial actions conducted at the base and the consequence for changes in PFAS impacts across the PFAS Management Area are provided in **Section 6.1**.

3.0 Sampling and analytical scope and methodology

3.1 SAQP revision history

A number of amendments have been made to sampling locations and/or frequencies which were originally detailed within the RAAF Base Tindal SAQP from Revision 6 (AECOM, 2023) to the current version Revision 0 (AECOM, 2025a) (which has been included in **Appendix B**). These amendments are summarised in **Table 2** below.

Table 2 Summary of SAQP amendments between Rev 6 (AECOM, 2023) and Rev 0 (AECOM, 2025a)

Rev 6 (December 2023) to Rev 0 (April 2025)
Groundwater (off-base private bores - Cossack)
• Revised to monthly monitoring in the wet season, and once during the dry season at 18 properties.
Groundwater (on- and off-base)
• Biannual sampling of all on- and off-base monitoring wells • Replacement of MW734 with MW133 • Removal of MW235 from sampling program • Replacement of POT119 with MW814 • Replacement of POT122 with MW815.
Surface water (on- and off-base)
• Quarterly sampled surface water locations (OTH008, SW100 and SW108) changed to biannual sampling.
Aquatic biota (off-base)
• No change.

3.2 Sampling schedule

The RAAF Base Tindal SAQP Revision 6 (AECOM, 2023) to Revision 0 (AECOM, 2025a) provide the sampling schedule and rationale for this reporting period between June 2024 to May 2025. The latest SAQP applicable to the most recent monitoring event (April – May 2025) is summarised in **Table 3** below, noting that Revision 6 SAQP (AECOM, 2023) was applied to the sampling events between June 2024 – May 2025. In essence, the adopted SAQP modifications consisted of replacing inaccessible monitoring wells and changing the frequency of sampling for selected locations.

Table 3 SAQP (Revision 0) sampling schedule (AECOM, 2025a)

Sample matrix	No. of sample locations	Frequency	No. of monitoring events per year	Approximate monitoring period
Groundwater	18	Monthly during wet season and once in dry season	7	• Wet season (November–April) • Dry season (August)
	1	Annual	1	• End of dry season (September-October)
	50	Biannual	2	• End of wet season (March-April) • End of dry season (September-October)
Surface water	6	Twice in wet season	2	• Start of wet season (November-December) • End of wet season (March-April)

Sample matrix	No. of sample locations	Frequency	No. of monitoring events per year	Approximate monitoring period
				Determined by when water is observed in on-base drains and Tindal Creek
	1	Annual	1	• End of dry season (August-October)
	6	Biannual	2	• End of wet season (March-April) • End of dry season (September-October)
Biota	Multiple samples from 2 locations	Annual	1	• End of dry season (August-October)

The list of surface water locations, groundwater monitoring wells, and biota locations that were sampled as part of the above monitoring events are listed in **Section 3.3**. The rationale for the well and location selection is summarised in the SAQP in **Appendix B** (AECOM, 2025a).

3.3 Summary of OMP works completed between 2024 and 2025

A summary of the monitoring works undertaken during the current monitoring period between June 2024 and May 2025, is presented in **Table 4.** OMP works were undertaken in accordance with the relevant SAQP with exception of deviations from the SAQP, which are summarised in **Section 3.4**.

The location of the groundwater samples collected in this monitoring period are shown on **Figure F2** and **F3** in **Appendix A**. The surface water and biota sampling locations collected during this monitoring program are presented on **Figure F4** and **Figure F5** in **Appendix A**.

Table 4 Summary of OMP scope of works between June 2024 and May 2025

Event	Relevant SAQP	Sampling locations frequency	Number of sampling locations
Dry season August - October 2024	Revision 6	Quarterly surface water	3
		Once in dry season private bore	18
		Biannual groundwater	3
		Annual groundwater	28
		Biannual surface water	3
		Annual biota	2
Start of wet season November 2024 - January 2025	Revision 6	Twice in wet season surface water	6
		Quarterly surface water	2
		Monthly in wet season groundwater	18
End of wet season February - April 2025	Revision 6	Monthly in wet season groundwater	18
		Biannual surface water	6
	Revision 0	Twice in wet season surface water	6
		Biannual groundwater	50

3.4 Deviations from the OMP

Sampling deviations and their potential impact on the program are summarised below in **Table 5**.

Table 5 Deviations to OMP SAQP

OMP / SAQP requirement	Deviation	Potential impact on OMP
Dry season (October - December 2024) (AECOM, 2025b)		
Collection of water quality parameters from surface water sampling locations.	Water quality parameters were not collected at SW151, which is collected during the aquatic biota sampling event.	Minor impact – a review of historical water quality parameter data indicated that there is minimal variance in parameter readings across the four Katherine River sampling locations, therefore collection from the other three locations should provide sufficient data for interpretive purposes.
Collection of three quarterly surface water samples.	OTH008 – the local public swimming pool, was unable to be accessed due to the facility being closed for renovations.	No impact to the program as sample collection from OTH008 monitors for potential health risks from PFAS within the swimming pool, therefore there are no risks to the public while the pool is not in operation.
Collection of 18 '*once in dry season*' private bore samples in August.	Samples for the dry season event were collected late in October 2024 due to a delay in signed access letters.	No impact as October 2024 results are still considered to reflect dry season conditions due to the limited to no rainfall that occurred between August and October 2024.
Gauging and sample collection of 28 annual groundwater locations.	23 annual groundwater locations were sampled. Five annual groundwater locations (or their SAQP listed alternative) were not able to be sampled: • MW117, and alternative location MW118, were both found to be dry. • MW134 could not be sampled due to root blockage. • MW138 could not be sampled due to root blockage. • MW235 was decommissioned prior to soil remediation work commenced at the former FTA. The SAQP does not list a suitable alternative well. • POT119, no access from the landowner provided since April 2021. A new groundwater monitoring well MW815 was installed in November 2024 to substitute data historically collected from POT119.	MW117 – Potential data gap for concentrations of PFAS on the western boundary track. MW130 (long screened interval like MW117) to the north was able to be sampled, reducing the impact of this data gap (2 km spatial data gap), though likely represents a lower PFAS concentration area. MW117 and MW130 overlap in screen intervals from 1 to 14.5 metres below ground level (m bgl). MW134 – Potential data gap for concentrations of PFAS north-west of the plume. MW135 (long screened interval like MW134) to the north was able to be sampled, reducing the impact of this data gap. MW134 and MW135 are screened the same from 2.5 to 19 m bgl. This well has been subsequently repaired and sampled during the 2025 end of wet season monitoring event. MW138 – Potential data gap for concentrations of PFAS centre of the plume. However, MW137 (long screened interval like MW138) to the north was able to be sampled, reducing the impact of this data gap. MW138 and MW137 are screened the same from 2 to 18 m bgl. This well has been subsequently repaired and sampled during the 2025 end of wet season monitoring event. MW235 – minimal data gap. MW235 has been decommissioned and has been removed from the OMP (Defence, 2025a) due to the location being within the PMAP Soil RAP remediated area and drilling a new well may compromise the cap. Significant data gap – POT119 is a sentinel well within private property along Gorge Rd, at the northern boundary of the plume. PFAS has historically been reported less than the laboratory limit of reporting (LOR). Due to ongoing access restrictions, a replacement monitoring well (MW815) has been installed near this sampling location on public land to address this data gap, however, the new well was not installed prior to this sampling event. The newly installed well was sampled during the 2025 end of wet season monitoring event, and MW815 has now replaced POT119 within the SAQP (AECOM, 2025a) and the revised OMP (Defence, 2025a).
Alternative location sampled for one annual groundwater location.	MW734, and alternative location MW132, were impacted by roots and a water sample could not be obtained.	Minor data gap – Nearby monitoring location MW133, which also has a long screened interval installed similar to MW734, was able to be sampled. MW734 and MW133 overlap in screened intervals from 3.2 to 19.7 m bgl, however, noting that MW734 is screened down to 80.9 m bgl. As PFAS concentrations tend to accumulate within the vadose zone, results from MW133 can be used to minimise the data gap. The intent of this cross-gradient well is to capture the northern plume boundary, along the northern base boundary, to ensure PFAS concentrations and thus the risk to the community to the north remain low.

OMP / SAQP requirement	Deviation	Potential impact on OMP
Additional 19 groundwater locations gauged and/or sampled.	MW136 is a groundwater monitoring well that is to be added to the upcoming OMP revision and therefore was included as part of the October-December 2024 monitoring event.	Additional data point – MW136 is located between the northern plume edge and nearby private bore users. Sampling from this location as part of the OMP will increase the resolution of the sentinel well network in tracking PFAS migration that could potentially impact nearby private bore users.
	MW118I, MW118D, MW119, MW130, MW131 are planned to be added to the upcoming OMP revision and were therefore included as a part of the October - December 2024 monitoring event.	Additional data points – These wells will monitor PFAS mass flux across the base boundary as they are located on the plume centreline and add overall data resolution to the program. MW119 was recorded as dry so not sampled on this occasion.
	MW106 and MW801S are planned to be added to the upcoming OMP revision and were therefore included as a part of the October - December 2024 monitoring event.	Additional data points – These wells will monitor PFAS mass flux downgradient of the former FTA on the base boundary, providing additional monitoring locations to track changes in PFAS concentrations in groundwater resulting from completed soil remediation works.
	MW109, MW109D, MW111 and MW111D are to be added to the upcoming OMP revision and therefore was included as part of the October-December 2024 monitoring event.	Additional data points – These wells will monitor PFAS mass flux downgradient of the FSA on the base boundary, providing additional monitoring locations to track changes in PFAS concentrations in groundwater resulting from completed soil remediation works.
	MW146, MW802S, MW802I and MW802D are planned to be added to the upcoming OMP revision and were therefore included as a part of the October - December 2024 monitoring event.	Additional data points – These wells will monitor the PFAS concentrations in the FSA source area providing additional monitoring locations to track changes in PFAS concentrations in groundwater resulting from completed soil remediation works.
	MW803S, MW803I and MW803D are planned to be added to the upcoming OMP revision and were therefore included as a part of the October - December 2024 monitoring event.	Additional data points – These wells will monitor PFAS concentrations in the former FTA source area providing additional monitoring locations to track changes in PFAS concentrations in groundwater resulting from completed soil remediation works.
Collection of three biannual groundwater samples.	POT122 was not able to be sampled. AECOM have not been able to gain access to the property since January 2022. A new groundwater monitoring well has been installed in November 2024 (MW814) to substitute data historically collected from POT122.	Significant data gap – POT122 tracks PFAS contamination in groundwater in the Emungalan area west of Katherine River where known PFAS impacts have been previously documented. Replacement monitoring well MW814 was installed near this sampling location to address this data gap, and was sampled during the biannual late wet season event in May 2025. This location has been subsequently added as a replacement location for POT122 in the revised Rev 0 SAQP (AECOM, 2025a).
Collection of annual groundwater samples within the end of dry season months (September-October).	MW403 data point to be used for interpretation was collected in December 2024: MW403 (off-base) results from October 2024 reported a new exceedance (1.34 µg/L) of the drinking water guideline for PFOS+PFHxS. This result was an order of magnitude greater than the historical data collected at this location. The monitoring well was re-sampled on 9 December 2024 and reported a concentration of 0.02 µg/L which is consistent with historical results. Consequently, the initial MW403 concentrations are excluded from further consideration and are replaced with the December 2024 reported concentrations.	Minor impact – MW403 was technically sampled during the 'start of wet season' (December 2024) rather than the 'end of dry season' (September-October months), results from the December sampling are still considered to reflect the dry seasons conditions, given the limited to no rainfall reported leading up to December 2024. Groundwater elevation gauging was conducted between the two sampling events to determine the appropriateness of using data collected in December as a part of the dry season data set. Groundwater levels increased by 0.229 m AHD between events, indicating that early wet season rain events did have a minor impact on water levels at MW403. However, it is not anticipated that the observed change in groundwater level would have diluted PFAS concentrations back to historical levels within the time between when samples were collected.
Use of National Institute of Measurement (NMI) Sydney as secondary laboratory.	During the October 2024 event, National Association of Testing Authorities (NATA) accredited laboratory ALS Environmental Pty Ltd (ALS) Brisbane was used as secondary laboratory instead of NMI as per SAQP.	No impact – The intent of the secondary laboratory is to ensure the results are repeatable when conducted by a different laboratory using different equipment. This ensures both the collected samples and the laboratory equipment utilised provide similar results, indicating both the sample methods and the laboratory equipment are adequate for providing accurate results. Therefore, the use of ALS Brisbane instead of NMI as the secondary laboratory has no material impact on the resulting data quality.
Collection of surface water sample from OTH008.	OTH008 was unable to be sampled due to the swimming pool being closed for renovations.	No impact to the program as sample collection from OTH008 monitors for potential health risks from PFAS within the swimming pool, therefore there are no risks to the public while the pool is not in operation.
Analysis of all samples for PFAS full suite standard analysis (LOR is 0.01 µg/L).	A select number of Cossack private property sample locations were selected for PFAS full suite low-level analysis (LOR of 0.002 µg/L).	No impact – additional information as PFAS low-level analysis allows for further understanding of PFAS distribution laterally to the west of Katherine River.

OMP / SAQP requirement	Deviation	Potential impact on OMP
Use of National Institute of Measurement (NMI) Sydney as secondary laboratory.	During the December 2024 event, National Association of Testing Authorities (NATA) accredited laboratory ALS Environmental Pty Ltd (ALS) Brisbane was used as secondary laboratory instead of NMI as per SAQP.	No impact – The intent of the secondary laboratory is to ensure the results are repeatable when conducted by a different laboratory using different equipment. This ensures both the collected samples and the laboratory equipment utilised provide similar results, indicating both the sample methods and the laboratory equipment are adequate for providing accurate results. Therefore, the use of ALS Brisbane instead of NMI as the secondary laboratory has no material impact on the resulting data quality.
End of wet season (February - May 2025)		
Collection of 50 biannual groundwater samples.	Collection of 46 of 50 groundwater samples: • MW117, MW118 and MW119 were unable to be sampled due to root blockages. • MW131 was not sampled as it has been destroyed.	MW117 – Potential data gap for concentrations of PFAS on the western boundary track. As a substitute, MW130 to the north and MW118I and MW118D to the south were able to be sampled, reducing the impact of this data gap (2km spatial data gap). MW118 – Potential data gap for concentrations of PFAS on the western boundary track. However, MW118I and MW118D were accessed and sampled, reducing the impact of this data gap. MW119 – Potential data gap for concentrations of PFAS on the western boundary track. However, MW118I and MW118D were accessed and sampled (located North of MW119), reducing the impact of this data gap. MW131 – Potential data gap for concentrations of PFAS leaving the base. However, MW130 that is situated on the same base boundary road was accessed and sampled, reducing the impact of this data gap.
Alternative location sampled for biannual groundwater locations	• POT119 was unable to be sampled. MW814 has been installed to replace the location. • POT122 was unable to be sampled. Nearby well MW815 was sampled instead.	POT119 and POT122 are on private properties and no signed access agreements are currently in place. Due to ongoing access issues, and to continue monitoring the risk profile in this area, MW814 and MW815 were installed to fill this data gap.
Collection of three quarterly surface water samples.	Collection of two of three surface water samples: • OTH008 was unable to be sampled. • SW108 and SW153 were sampled a month early.	No impact to the program as sample collection from OTH008 monitors for potential health risks from PFAS within the swimming pool, therefore there are no risks to the public while the pool is not in operation. SW108 & SW153: No impact as sampling locations have been changed to biannual under Rev 0 SAQP (AECOM, 2025a).

4.0 Quality assurance and quality control

The validation of data presented and interpreted in this report has been previously completed and discussed within the individual SER's provided in **Appendix B**.

Data validation procedures employed in the assessment of the field and laboratory quality assurance and quality control (QA/QC) data indicated that the overall quality of the analytical data produced is acceptably reliable for the purpose of this OMR. An examination of sampling analysis data compared to the data validation findings did not indicate any results that required flagging for potential inaccuracies.

AECOM considers the data obtained during the current monitoring period, along with the historical data assessed, to be representative of the on- and off-base conditions at the time of monitoring and to be suitable for the temporal assessment of the data.

All data collected during this event have been reviewed and uploaded to the Defence ESdat database in accordance with Defence Contamination Management Manual (DCMM) (Defence, 2021a) Annex L requirements.

5.0 Assessment criteria

PFAS screening values have been adopted for groundwater and surface water from the Defence OMP (Defence, 2025a) and are derived from the following documents:

- HEPA, 2025. PFAS National Environmental Management Plan (PFAS NEMP 3.0) (HEPA, 2025)
- Department of Health (DoH), 2019. Health Based Guidance Values for PFAS for use in investigations in Australia. September 2019 (DoH, 2019)
- National Health and Medical Research Council (NHMRC), 2019. Guidance on PFAS in Recreational Water. August 2019 (NHMRC, 2019)
- National Environment Protection (Assessment of Site Contamination) Measure 2013 (ASC NEPM) (National Environment Protection Council (NEPC), 2013).

5.1 Groundwater and surface water

Adopted PFAS screening values for groundwater and surface water are provided in **Table 6**.

Table 6 Summary of adopted screening criteria for groundwater and surface water

Human health receptors			
Pathway	**Compound**	**Criteria**	**Comment / reference**
Drinking water	PFOS	0.008 µg/L	The values presented in the PFAS NEMP 3.0, 2025 are from DoH 2019, which published final health-based guidance values for PFAS for use in site investigations in Australia. DoH utilised the total daily intake (TDI) for PFOS and PFOA from Food Safety Australia and New Zealand (FSANZ, 2017) and the methodology described in Chapter 6.3.3 of the NHMRC Australian Drinking Water Guideline (ADWG) to determine drinking water criteria values. This report has adopted the revised ADWG (NHMRC, 2025), which is discussed further in **Section 5.1.1**. *All groundwater and surface water results will be compared to these criteria.*
	PFHxS	0.03 µg/L	
	Perfluorooctanoic acid (PFOA)	0.2 µg/L	
	Perfluorobutane sulfonic acid (PFBS)	1 µg/L	
Recreational use	PFOS+PFHxS	2 µg/L	The values presented in the PFAS NEMP 3.0, 2025 are from the NHMRC guidance on the assessment of PFAS in surface water released in August 2019. Rather than adopting an ingestion rate of 0.2 L of water per day (as per the ADWG formula), NHMRC adjusted this rate with consideration of an event frequency (150 events / year) to calculate an annual ingestion rate of 30 L per year. *All groundwater and surface water results will be compared to these criteria.*
	PFOA	10 µg/L	

Ecological receptors			
Pathway	**Compound**	**Criteria**	**Comment / reference**
Freshwater	PFOS	0.00023 µg/L	These values are from the PFAS NEMP 3.0 (HEPA, 2025). The 99% level of protection has been applied for slightly to moderately disturbed ecosystems. This approach is adopted for chemicals that bioaccumulate and biomagnify in wildlife. For the purposes of preliminary screening of analytical water results, the laboratory LOR will be adopted rather than sole use of the criteria value.
	PFOA	19 µg/L	

Note: HEPA (2025) notes that the 99% species protection level for PFOS is close to the level of detection. Agencies may wish to apply a 'detect' threshold in such circumstances rather than a quantified measurement. The laboratory PFOS limit of reporting (LOR) adopted in this report is 0.001 µg/L.

Consistent with the OMP (Defence, 2025a), the assessment of groundwater and surface water has considered both drinking water and recreational water usage for both environmental values due to the usage behaviours by identified human receptors associated with both on- and off-base areas.

The drinking water guideline value has been applied to surface water as the town water supply is partially sourced from surface water from the Katherine River, and the interaction between surface and groundwater due to groundwater expressing through springs and surface water infiltrating into groundwater through sinkholes. The recreational water guideline value has also been applied to groundwater due to groundwater expressing through springs and the use of groundwater extraction for irrigation and recreational use, such as the filling of private swimming pools and potentially public swimming pools.

5.1.1 Revised drinking water guideline values

The drinking water guideline values were reviewed by NHMRC between 2023 and 2025, which has resulted in new and revised health-based guideline values (refer **Table 6** above) and advice to reduce health risks from exposure to PFAS in drinking water (NHMRC, 2025). Notably, the updates include:

- Separate guideline values of PFOS and PFHxS
- Reduced guideline values for PFOS, PFHxS, and PFOA
- Reduced guideline value for PFOS below the standard laboratory testing LOR (0.01 µg/L), requiring a low-level PFAS testing to adequately assess the new PFOS guideline value (0.008 µg/L)
- A new guideline value for PFBS.

During the sampling period of June 2024 and May 2025, the guidelines were in draft and yet to be adopted. However, as a conservative approach, low-level PFAS analysis was conducted with consideration of the incoming guidelines likely to be below standard LORs and adopted as the drinking water criteria in future reviews. Locations were selected for low-level PFAS testing based on:

- Historical PFAS analytical results consistently reported below the standard PFAS laboratory LORs at sentinel locations along the plume boundary, or
- Sampling locations located west of the Katherine River and on private properties (refer to the Cossack sampling deviation addressed in **Table 5**).

Locations within PFAS Management Zone 1 and Zone 2 were not considered, as precautionary advice to the Katherine community to not use groundwater for potable water uses has been well communicated since implementation of the PFAS Monitoring Zones (Coffey, 2018c) and acknowledged by the community through responses to water use surveys.

A summary of locations assessed for low-level PFAS testing is summarised below in **Table 7**.

Table 7 Low-level PFAS testing sample locations

Rationale	Sampling Location ID
Historical concentrations < LOR at sentinel locations along the plume boundary	MW133, MW136, MW142, MW144, MW815, OTH111, OTH117, OTH118, OTH119
West of Katherine River on private properties	POT111, POT114, POT120, POT124, POT125, POT126, POT127, POT128, POT129, POT130, POT131, POT198, POT201

5.2 Aquatic biota

Adopted PFAS screening values for groundwater and surface water are provided in **Table 8**.

Table 8 Summary of adopted screening criteria for aquatic biota

Human health (biota) receptors			
Media	**Chemical**	**Criteria**	**Comment / reference**
Crustaceans, 2 - 6 years (all species)	PFOS	0.065 milligrams per kilogram (mg/kg)	Department of Health (DoH) (2019) *Derivation: Children 2-6 years, median consumption* Occasionally consumed food. Trigger criteria for investigation for crustaceans apply to molluscs.
	PFOA	0.52 mg/kg	
	PFOS+PFHxS	0.065 mg/kg	
Finfish, 2 - 6 years (all species)	PFOS	0.0052 mg/kg	DoH (2019). *Derivation: Children 2-6 years, P90 consumption*
	PFOA	0.041 mg/kg	
	PFOS+PFHxS	0.0052 mg/kg	

Biota sampling has been identified by outcomes of ecological risk assessments and is conducted to indicate where biota may be exposed to PFAS intake above ecological toxicity values, to support future review of human exposure risk to ingestion of biota containing PFAS.

5.3 OMP triggers

Further to the adopted screening criteria, the OMP outlines site-specific triggers and recommended actions (if triggers are met) that results are to be reviewed against.

The 2024 sampling events (end of dry season, start of wet season) were undertaken in accordance with the 2021 OMP (Defence, 2021b) while the 2025 sampling event (end of wet season) was undertaken in accordance with the revised 2025 OMP (Defence, 2025a). Triggers have changed between the OMP versions, with both the 2021 and 2025 triggers detailed below in **Table 9** and **Table 10** respectively.

Herein, this report will assess all data against the revised 2025 OMP trigger points.

Table 9 Former OMP trigger points (Defence, 2021b)

Locations	Trigger point
Groundwater locations previously below laboratory LOR for PFAS	First time detection of PFAS compounds in groundwater.
All monitoring locations (groundwater, surface water or biota)	PFOS+PFHxS and/or sum of PFAS concentrations show an increasing trend (using statistical analysis) over two years of monitoring or increase by >30% in one year.
	PFOS+PFHxS and/or sum of PFAS concentrations show decreasing trend (using statistical analysis) over two years of monitoring or decrease by >30% in one year.
All groundwater monitoring locations	Groundwater monitoring well is not able to be sampled as it is dry, blocked, damaged, decommissioned, inaccessible, lost etc.

Locations	Trigger point
Groundwater private bores in Cossack and Emungalan	PFOS+PFHxS and/or sum of PFAS concentrations in a bore show an increasing trend (using statistical analysis) over two years of monitoring or increase by >30% in one year, or Concentrations are reported above the adopted drinking water health-based screening level.
Groundwater private bore on Uralla Road (POT111)	Concentrations of PFAS are reported in POT111 which indicate an increase in plume size or concentrations above drinking water criteria.
Groundwater private bore on Gorge Road (POT119)	Detectable concentrations of PFAS are reported in POT119.
MW734	PFOS+PFHxS and/or sum of PFAS concentrations at MW734 show an increasing trend (using statistical analysis (over two years of monitoring or increase by >30% in one year.

Table 10 Revised 2025 OMP trigger points - end of wet season (Defence, 2025a)

Locations	Trigger point
Groundwater locations previously below laboratory LOR for PFAS	First time detection of PFAS compounds in groundwater.
Groundwater locations within specific management zones	PFAS concentrations in groundwater that reported above the designated management zone criteria or an identified change in the risk profile resulting from the reported concentration.
Private bores in Cossack	New exceedance of PFAS compounds in groundwater above the adopted drinking water health-based screening level.
Private bore on Uralla Road (POT111)	Concentrations of PFAS are reported in POT111 which indicate an increase in plume size or concentrations above drinking water criteria.
Northwestern sentinel well located on Gorge Road east of Katherine River (MW815)	Detectable concentrations of PFAS are reported in MW815.
On-base location (MW133)	Concentrations of PFOS+PFHxS and/or Sum of PFAS concentrations show an increasing trend (using statistical analysis) over two years of monitoring.
Off-base location on public land (MW136)	Detectable concentrations of PFAS are reported in MW136.
All groundwater and surface water locations	Changing PFAS drinking water guideline values • Consider where analysis at a lower LOR may be required in locations where there is a complete or potential drinking water exposure pathway • Consider additional steps, such as water use surveys, further surface water and groundwater sampling to determine the defined extent of contamination with the lower LOR • Review all ambient groundwater and surface water sampling locations to advise where additional analysis of PFAS at a lower LOR may be required to understand ambient PFAS conditions.

6.0 Contextual and ancillary information

6.1 Remediation projects

6.1.1 Ongoing groundwater remediation activities

Two water treatment plants (WTPs) are in operation at the FTA and FSA, which are identified in the PMAP as primary source areas (refer to **Section 2.3**). The WTP at the FTA has been in operation since February 2019 and the FSA WTP has been in operation since May 2019. Contaminated groundwater from the Tindall Limestone Aquifer is extracted and transferred into the treatment system, where water is treated (via anion exchange filtration) and then re-injected back into the Tindall Limestone Aquifer or reused on base for operational purposes. An investigation into optimising the WTPs has been conducted, which identified targeting groundwater in the less permeable zone above the limestone aquifer (Defence, 2025c). A new well field is being installed at both the FTA and the FSA to extract groundwater from the lower permeable zone to be treated at the existing WTPs and reinjected into the underlying limestone aquifer after treatment.

Since commissioning in 2019, both WTPs have treated 3,510 Megalitres (ML) of extracted groundwater respectively (as of 28 May 2025). Additional aquifer testing and groundwater monitoring is continuing down-gradient of both WTPs to supplement the understanding of PFAS migration from the two primary source areas (FTA and FSA) and identify the impacts that treatment has had on the geometry and magnitude of the two groundwater plumes sourced from the FTA and FSA. This information will be documented separately, as evaluating WTP effectiveness is not part of this OMR, as the data collected through the OMP is insufficient to fully evaluate the effects the WTPs have upon PFAS mass-flux.

As part of ongoing PFAS management, Defence has provided alternative drinking water supplies to groundwater users impacted by PFAS contamination. This program has been in place since 2017 and continued through the monitoring period. This includes the recent commissioning of the long-term Katherine town WTP in May 2024, supplying up to 10ML/day of potable water to the community.

A base wide PFAS groundwater and surface water mass flux study is currently being undertaken separately to understand changes in conditions pre- and post-implementation of remedial actions. The information derived from this study will be used, along with other relevant PFAS data, to provide an accurate PFAS mass flux baseline to track changes in PFAS discharge from the base source areas to downgradient areas.

6.2 Soil remediation activities – key source areas

A Soil RAP (Coffey/Tetra Tech, 2022) was developed for the base to address PFAS contaminated soils at the two primary source areas (i.e. the FSA and FTA). Soil remediation works commenced at the FSA and FTA in 2022, with the FSA being completed in mid-2023 and works at the FTA completed in November 2024. Further information is provided below for the status and scope of soil remediation works completed.

6.2.1 FSA soil remediation

The works at the FSA remediation area comprised excavation of soils containing elevated concentrations of PFAS. Approximately 9,000 m^3 of PFAS impacted soils (out of approximately 10,000 m^3 excavated) were excavated and temporarily stockpiled on-base for characterisation sampling and treatment using a powdered activated carbon (PAC) amendment. The additional 1,000 m^3 of excavated soil was determined by testing to be below the required treatment PFOS+PFHxS concentration of 1 mg/kg and was segregated and included in the reinstated material. Treated and non-treated soils were backfilled into the excavation, compacted, and capped with compacted imported clay fill to reduce vertical infiltration of water and permeability. The reinstatement, compaction and capping of treated soils has been completed in late 2022. The site has been hydroseeded and long-term management of the site has been turned over to the base grounds management team.

Post remediation groundwater sampling has been conducted at the FSA between 2023 – 2025 during wet season conditions with the results reported separately, although it was anticipated that any observed changes in PFAS concentrations within groundwater resulting directly from soil remediation activities conducted at the FSA is unlikely in the short term (i.e. during the current monitoring period,

which is further discussed in **Section 8.0** below). Future OMP monitoring will continue to assess the impact that soil remedial works have had or will have on the spatial and temporal trends in PFAS concentrations in groundwater.

6.2.2 FTA soil remediation

Between 2022 – 2024, all FTA infrastructure (training pad and three concrete evaporation ponds) and approximately 23,300 m^3 of soils with elevated PFAS concentrations were excavated. A total of 1,000 m^3 had PFAS concentrations greater than 50 mg/kg and was transported off-base to a facility in Victoria for thermal destruction. Furthermore, approximately 50 m^3 of PFAS impacted sediments were removed from three evaporation basins, and approximately 70 m^3 of PFAS-impacted concrete material which were also transported interstate for thermal destruction.

A total of 1,100 m^3 of concrete from the previous FTA training pad and three evaporation basins has been crushed placed within the treatment excavation area.

An additional 11,000 m^3 of soil containing PFAS has been excavated, characterised, and treated using PAC. Treated soils were then backfilled into the excavation, compacted, capped and recontoured to reduce vertical infiltration, these works completed with the hydroseeding of the cap in November 2024.

It is estimated that 209 kilograms of PFOS+PFHxS was remediated through either stabilisation or offsite destruction, and an additional 56 kilograms of PFOS+PFHxS within evaporation pond sediments and concrete fines material were sent offsite for destruction, for an estimated total of 265 kilograms of PFOS+PFHxS from the FTA having been treated or destroyed. A conservative estimate of 72 kg PFOS+PFHxS mass remains at relatively low concentrations (average concentrations of 0.06 mg/kg) at the edges of the former FTA area outside of the remediation area. It is estimated that 75% of the PFOS+PFHxS mass at the FTA was remediated (AECOM, 2025e).

Post remediation groundwater sampling was conducted at the FTA between 2024 – 2025 during wet season conditions with the results to be reported separately. Minor changes in PFAS concentrations and compositions, within groundwater resulting from remediation activities at the FTA have been observed in the data collected during the reporting period (discussed further in **Section 8.4.4** below). It is anticipated that additional improvements are likely to be gradual and may take time to be reflected in monitoring data. Future monitoring will continue to track changes in PFAS concentrations occurring downgradient resulting from the remediation works completed at the FTA.

6.3 Related on- and off-base infrastructure projects

6.3.1 Off-base infrastructure projects

As part of Defence's ongoing PFAS management, Defence has provided alternative drinking water supplies to groundwater users impacted by PFAS contamination. This program has been in place since 2017 and continued through the monitoring period. This includes the recent commissioning of the long-term Katherine town WTP in May 2024, supplying up to 10ML/day of potable water to the community.

6.3.2 On-base infrastructure projects

Current on-base infrastructure projects where PFAS impacted soils may have been or will be excavated and managed and therefore have the inadvertent potential to reduce the mobilisation of PFAS across the broader base include, but are not limited to, the following:

- P200 Jet Fuel Storage Tanks:
  - Construction and covering of bulk fuel storage tanks.
- P500 Bomber Apron:
  - Construction of a parking apron for aircraft.
- P400 Aircraft Maintenance Support Facility:
  - Construction of a storage facility for aircraft ground support.

- P700 Squadron Operations Facility:
  - Construction of a planning, administrations and communications facility for deployed United States Air Force crews and support staff.
- EST00346 Tindal Redevelopment Stage 6:
  - Base-wide electrical infrastructure upgrades, new water main installed to create a ring main in the water infrastructure network and replacement of valves in the combined potable/fire-fighting hydraulic system, storm water system upgrades, construction of new permanent Living in Accommodations, Camp 3 Fighter OPTECH facilities replacement, Military Working Dog Kennels refurbishment and Northern Regional Operations Centre upgrades/replacement.
- EST00347 Airfield Works and Associated Infrastructure:
  - Runway and taxiway upgrades (extension, widening and strengthening) including Aeronautical Ground Lighting, new aircraft parking apron, new aviation fuel farm, Air Movements Terminal, upgrades to the supporting site infrastructure and AIR6000 NACC Integrated Power Pack works. It is noted that significant earthworks have been conducted between the FSA and the runway to the southeast. These earthworks may have contributed to the release of PFAS in shallow soils and contributed to PFAS concentrations observed in surface water collected during the 2024 – 2025 wet season period.
- EST08452 Fire Station Refurbishment:
  - Construction of new separate accommodation facility comprising of eight (8) sleeping quarters and a female change / locker room. Includes construction of 50 m of new covered external walkway.
  - Replacement of roof, wall cladding and vapour barrier to air-conditioned area of building including, but not limited to replacement of roof sheeting, vapour barrier, insulation, wall cladding and insulation, flashings and gutters.
- EST08507 Perimeter Fencing:
  - Installation of airside fencing.
- AIR7001:
  - Construction of facilities next to civilian terminal including hangars, support buildings, car park area, and aircraft aprons and taxiways.

On-base infrastructure projects listed above all include movement of soils and / or changes in existing infrastructure. All works completed on-base are required to conduct works in accordance with the Defence PFAS Construction and Maintenance Framework (Defence, 2021c), and therefore impacts from infrastructure projects are not anticipated, although any movement of PFAS impacted soil may have temporary impacts to localised surface water and / or groundwater. Significant earthworks as occurred between the FSA and the runway area that may have loosened soils and exposed PFAS sorbed to shallow soils in the area to erosional forces, potentially releasing PFAS into the localised drainage system at a faster rate than soils that are undisturbed and naturally bound. Increased PFAS concentrations were observed in surface water samples collected during the 2025 late wet season sampling event compared to previous sampling events, with 2021 being the last time comparable concentrations were recorded. Further discussion can be found in **Section 8.5.3** and **Section 9.0**.

6.4 Climate

Climatic data for the region was extracted from the Tindal Airport Bureau of Meteorology (BOM) weather station (014932), located immediately adjacent to the base (BOM, 2025). The twelve-month monitoring period was characterised by hot and dry winters between June to October 2024 and May to July 2025, and hot, humid wet summers between October 2024 to May 2025.

Total rainfall for 2024 was 1188.8 mm, and 701.4 mm between January 2025 to 8 May 2025 (BOM, 2025). The rainfall occurring during the reporting period was 1128 mm over 12 months, which is similar to the mean annual rainfall, although total rainfall for the 2023-2024 wet season was above the long-

term average. **Figure 1** (below) shows the mean monthly rainfall for the last six years between 2018 to 2025 (May).

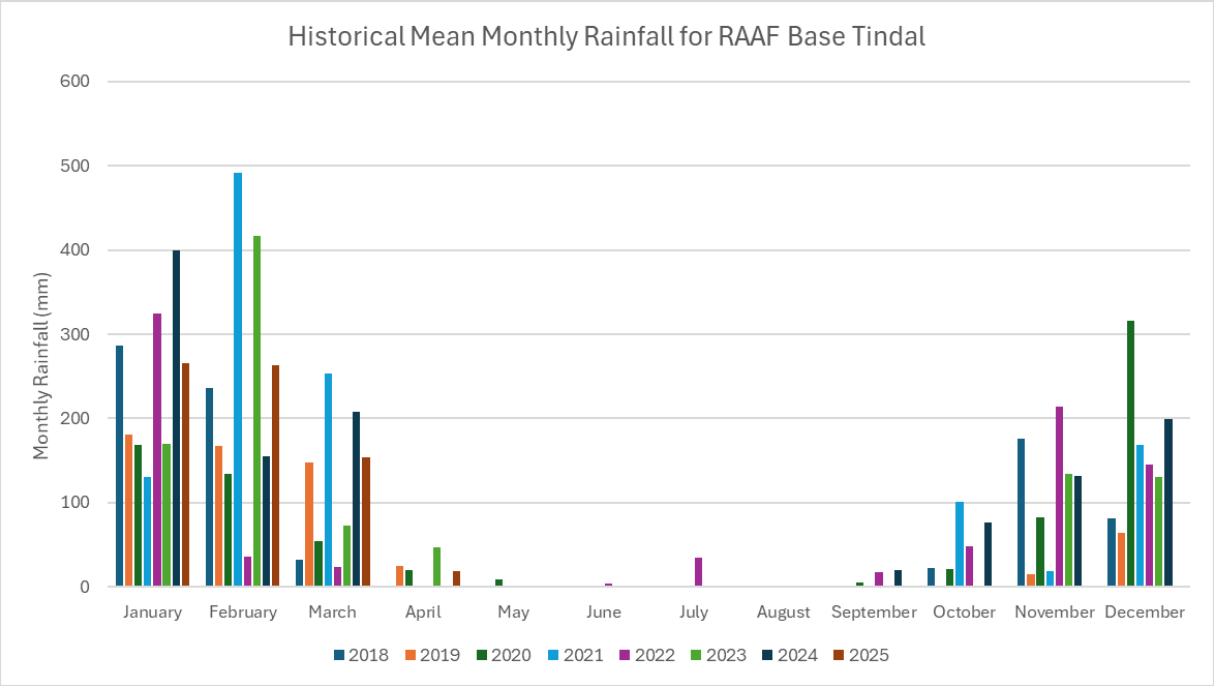

Figure 1 Mean monthly rainfall for RAAF Base Tindal (Station 014932, up to 8 May 2025) (BOM, 2025).

Monitoring during the past 12 months also included obtaining or measuring water levels within the Katherine River. Measured water levels at the Railway Bridge (Station G8140001) reached a maximum level of 8.198 m (20 February 2025) and a minimum of 0.242 m (22 August and 30 September 2024) (DEPWS, 2024). River levels for 2024 to 2025 are shown in **Figure 2** (below).

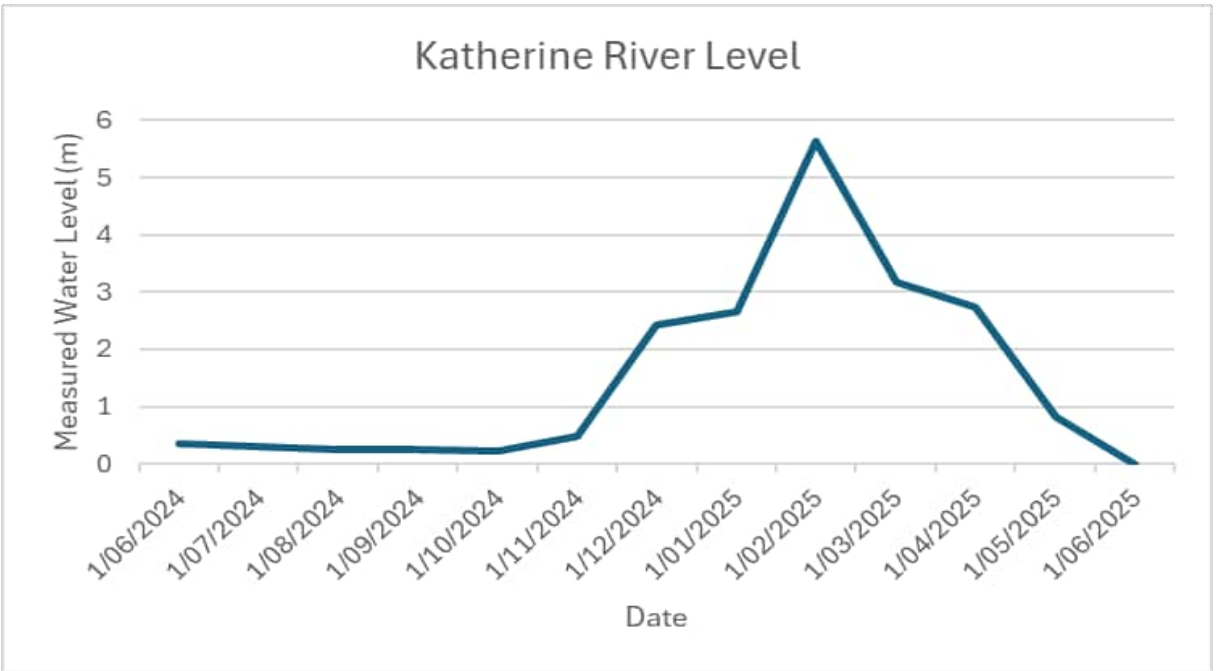

Figure 2 Measured Katherine River Level (m) June to 1 May 2025 (Katherine River Railway Bridge – G8140001)

Regionally, the relationship between climatic / rainfall conditions and PFAS concentrations is complex, with below average rainfall potentially increasing PFAS concentrations in Katherine River water, due to limited recharge and decreased dilution (Coffey, 2018a). Conversely, above average rainfall is likely to

increase both groundwater recharge and groundwater levels in the Tindall Limestone Aquifer, causing an increased mobilisation of PFAS into groundwater from source areas. Outside of source areas, in areas where rainfall can penetrate to the groundwater aquifer, above average rainfall could serve to dilute concentrations of PFAS in groundwater as clean water enters the system.

Monthly maximum mean temperatures were reported at the level or below the long-term average for the majority of the 2024-2025 monitoring period (refer to **Figure 3**).

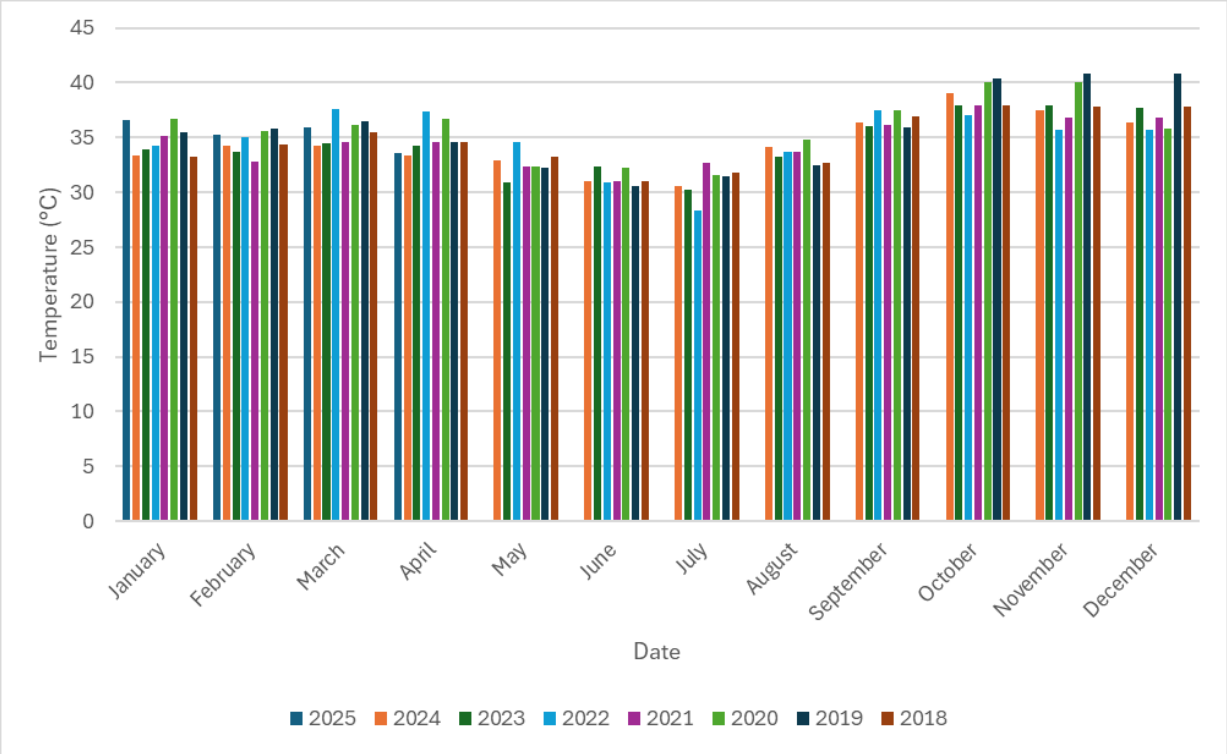

Figure 3 Measured average maximum temperature for Katherine 2018-2025 (RAAF Base Tindal, Station 014932)

The combined climatic conditions are likely to result in changes to the hydrogeological system and manifest in outcomes relevant to the monitoring of PFAS in the Katherine region. Changes may include groundwater gradients, groundwater flow directions, and PFAS concentrations / mass flux in groundwater, creek and river systems. **Figures F6.1** and **F6.2** in **Appendix A** presents groundwater flow directions for the monitoring period during the June 2024 and May 2025 groundwater monitoring events. These results are discussed further in **Section 8.1** below. Seasonal changes in precipitation appear to affect PFAS concentrations in Katherine River with higher concentrations observed during the dry season when there is less dilution and a higher percentage of river recharge occurring from springs fed by the Tindall Limestone Aquifer. Lower concentrations are observed over the wet season when there is a higher percentage of river recharge occurring from surface water runoff throughout the greater Katherine watershed (i.e. greater dilution). No other climate influenced predictable patterns have emerged from data collected to date.

7.0 Monitoring data summary

7.1 Groundwater

7.1.1 Summary of groundwater data presentation sources

Groundwater data are graphically represented in **Appendix A** on the following figures:

- **Figure F1**: location of the groundwater management area, and concentration-based management areas, alongside key surface water features
- **Figures F2 – F3**: on- and off-base groundwater monitoring locations
- **Figures F6.1 – F6.2:** interpreted groundwater flow direction and elevation contours for October 2024 and April-May 2025 respectively
- **Figures F7.1, F7.3, F7.5, F7.7, F7.9. F7.11. F7.13, F7.15, F7.17**: concentrations of PFOS+PFHxS for on-base and off-base groundwater locations
- **Figures F7.2, F7.4, F7.6, F7.8, F7.10, F7.12, F7.14, F7.16, F7.18**: concentrations of PFOA for on-base and off-base groundwater locations.

With adoption of the new drinking water guideline values (NHMRC, 2025), PFBS concentrations have been reviewed and detections listed in **Section 7.1.4**, however, figures have not been developed for PFBS at this time, with focus remaining primarily on PFOA and PFOS+PFHxS concentrations and trends.

The gauging and water quality parameter results obtained during the groundwater sampling work from the current monitoring period are provided in **Table T1a** and **Table 1b** respectively, in **Appendix C.** Historic groundwater analytical results for the groundwater Management Area have been provided as **Table T2** in **Appendix C**. These results are discussed in the following subsections.

7.1.2 Groundwater field parameters

During each sampling event, groundwater quality physiochemical field measurements were recorded ex-situ, after collecting groundwater samples. Parameters are presented in each of the respective factual sampling event reports in **Appendix B**, and tabulated in **Table T1b** (**Appendix C**).

The maximum and minimum recorded field parameters for the monitoring period are provided below in **Table 11**. Note that the maximum and minimum recorded field parameters for the period preceding the monitoring period have also been included in the table for comparison purposes.

From this comparison, overall, the groundwater quality field measurements for the monitoring period readings are consistent with historical data.

Table 11 Groundwater quality parameter ranges

Event	No. of samples	DO (mg/L)	EC (µS/cm)	pH	Corrected redox (mV)	Temperature (°C)
May 2017 - May 2025 (Historical)	780	0.02 (MW146) – 9.68 (MW110) *Poor to oxygenated conditions*	3 (POT114 and POT119) - 8,428 (POT130 *Freshwater to brackish conditions*	4.67 (MW244) – 10.98 (MW127) *Acidic to alkaline conditions*	24.9 (POT120 – 1,143.8 (MW231) *Oxidising conditions*	17.7 (POT120) – 48.7 (POT127)
July 2024 - October 2024 (Dry season)	58	0.53 (MW136) – 5.57 (OTH120) *Poor to oxygenated Conditions*	226 (MW231) – 1,577 (MW802S) *Freshwater to brackish conditions*	5.08 (OTH114) – 7.76 (POT125) *Acidic to mildly alkaline conditions*	162.6 (MW244) – 385.1 (MW285) *Oxidising conditions*	29.7 (POT124) – 48.7 (POT127)
November 2024 - January 2025 (Start of wet season)	55	0.35 (OTH117) – 7.02 (POT125) *Poor to oxygenated Conditions*	89 (POT113) – 957 (OTH119) *Freshwater to brackish conditions*	5.24 (MW140) – 7.86 (POT129) *Acidic to mildly alkaline conditions*	242.3 (POT125) - 347.2 (MW140) *Oxidising conditions*	27.1 (POT120) – 44.1 (OTH117)
February 2025 - May 2025 (End of wet season)	100	0.32 (MW146) – 8.81 (POT127) *Poor to oxygenated Conditions*	78 (MW137) – 1,346 (MW803I) *Freshwater to brackish conditions*	5.98 (OTH119) – 8.90 (MW285) *Acidic to alkaline conditions*	32.8 (MW109S) - 430.4 (POT112) *Oxidising conditions*	25.4 (POT121) - 41.8 (POT131)

Note: DO = dissolved oxygen; EC = electrical conductivity, values for water parameters presented as (min – max)
Corrected redox means a temperature-based adjustment has been made to the field measurement of oxidation-reduction potential (ORP) to convert it to the standard hydrogen electrode (SHE) standard. A water with a positive corrected redox is considered to be an oxidising agent, a water with a negative corrected redox is considered to be a reducing agent.

7.1.3 Groundwater elevations

The standing water levels (SWL) were measured in the selected monitoring wells during the biannual monitoring events to evaluate the groundwater elevations (m AHD) at on- and off-base locations. Groundwater gauging measurements were only collected during the annual and biannual monitoring events as samples collected during the monthly in wet season and the once in dry season are collected from extraction bores where gauging is not feasible. The groundwater elevation ranges measured during the biannual monitoring events are summarised in **Table 12** below with gauging data presented in **Table T1** (**Appendix C**).

Table 12 Summary of groundwater elevations

Monitoring event	No. wells gauged*	Min GWE (m AHD)	Max. GWE (m AHD)
End of dry season (October - December 2024)	37	91.9 (MW144)	131.47 (MW244)
End of wet season (April 2025)	38	89.1 (MW814)	133.5 (OTH111)

Note: GWE = groundwater elevation. * Number of wells gauged may not equal number of groundwater wells shown in GWE figures due to reference elevation not available to convert metres below top of casing (mbTOC) to m AHD.

Inferred groundwater flow direction at the base is presented on **Figure F6.1** and **Figure F6.2** (**Appendix A**) which was based on the calculated groundwater elevations measured during the 2024 end of dry season and 2025 end of wet season events. The data obtained from the monitoring period indicated that groundwater flow within the Management Area flows west towards Katherine River. This is consistent with historical gauging events.

Rainfall data for this period is summarised above in **Figure 1** (**Section 6.3**). Groundwater elevations are presented in **Table T1** in **Appendix C**. Base-wide groundwater elevation data collected for presentation of potentiometric contours was collected during a separate gauging event documented in Dry Season SER 2024 (AECOM, 2025b) in **Appendix B**.

In summary, the base and Katherine Township are situated above the unconfined Tindall Limestone Aquifer, where groundwater levels fluctuate seasonally by rising or falling in response to wet and dry season conditions and is indicative of a highly transmissible aquifer. The cavernous nature of the Tindall Limestone Aquifer provides significant preferential flow pathways that are conduits for rainfall infiltration. Groundwater discharge also takes place through seepage into fluvial systems via fractures throughout the formation at depths of the surface water drainage (e.g. Katherine River Hot Springs). Groundwater expression areas have also been observed in Tindal Creek on base, where PFAS impacted groundwater expresses intermittently into surface water that flows directly into Tindal Creek. It is possible that as the dry season is established, this flow ceases / pools downgradient within the Creek and then vertically infiltrates towards the aquifer.

The flow directions provided in this OMR are consistent with those measured in the Detailed Site Investigation (DSI) (Coffey, 2018a).

The Tindall Limestone Aquifer provides persistent baseflow to the Katherine River. Based on groundwater modelling performed by NT Department of Environment and Natural Resources groundwater particles found in the Katherine River take between 3 months and 50 or more years to reach the river (Schult, 2016).

Seasonal fluctuations in groundwater levels within the Tindall Limestone Aquifer have been observed, suggesting aquifer recharge can be rapid. Based on the localised rainfall patterns that occur in the monitored area, the magnitude of the hydraulic gradient may vary spatially during the wet season. The understanding of the duration and spatial extent of hydraulic gradient fluctuations could be improved by collecting time-series groundwater level data using dataloggers, during the wet season particularly at key locations which are not accessible during wet periods.

7.1.4 Groundwater PFAS analytical results

All groundwater analytical results for each monitoring event are presented in **Table T2** (**Appendix C**) along with historical analytical results. Results are presented visually in **Figures F7.1 – F7.18** (**Appendix A**).

A summary of the groundwater monitoring analytical results for both on- and off-base locations for PFOS, PFOA and PFOS+PFHxS are summarised in **Table 13**. First-time detections of PFOS, PFOA and / or PFOS+PFHxS are summarised in **Table 14**. Results outside of the expected management zone area concentration range are summarised in **Table 15**, **Table 16** and **Table 17**. New maximum and new minimum concentrations are summarised in **Table 18** and **Table 19** respectively.

Interpretation of results is provided in **Section 8.0**.

Table 13 Summary of PFOA, PFOS, and sum of PFOS+PFHxS concentrations in primary groundwater samples (October 2024 - May 2025)

Monitoring event	No. of sample locations analysed	Compound	Concentration range for reporting period (>LOR) (µg/L)	No. of sample locations with concentrations >LOR	No. of samples exceeding drinking water criteria (HEPA, 2025)	No. of samples exceeding recreational water criteria (HEPA, 2025)	No of samples exceeding freshwater 99% species protection criteria (HEPA, 2025) **
Dry Season (October – December 2024*)	62 (On-base and Off-base)	PFOA	<0.01 - 108 (MW231)	27	11	4	4
		PFOS+PFHxS	<0.01 - 8,170 (MW803D)	43	N/A	N/A	N/A
		PFOS	<0.01 - 8,020 (MW803D)	43	43	16	43
		PFBS	<0.02 - 116 (MW231)	27	9	N/A	N/A
Start of Wet Season (November '24 - January '25)	54 (Off-base)	PFOA	<0.0002 - 0.005 (OTH119)	3	0	0	0
		PFOS+PFHxS	<0.002 - 0.18 (POT113)	31	N/A	N/A	N/A
		PFOS	<0.002 - 0.08 (POT113)	27	21	0	27
		PFBS	<0.002 - 0.005 (OTH119)	5	0	N/A	N/A
End of Wet Season (February to May 2025)	99 (On-base and off-base)	PFOA	<0.002 - 76.7 (MW129)	32	11	5	3
		PFOS+PFHxS	<0.002 - 1,430 (MW803D)	66	N/A	N/A	N/A
		PFOS	<0.002 - 1,230 (MW803D)	65	61	15	65
		PFBS	<0.002 - 56.5 (MW231)	31	10	N/A	N/A

* = Some dry season locations were collected in November or December as mentioned in Section 3.4.

** = only samples detected above LOR
N/A – Criteria not applicable

First-time detections of PFOA, PFOS and PFOS+PFHxS reported during the monitoring period are presented in **Table 14** below.

Table 14 Groundwater analytical results - first-time detections of PFOA, PFOS and PFOS+PFHxS

Monitoring event	Area	Location	Details
Dry season	Nil	-	-
Start of wet season	Private bore properties in the Cossack area	POT125	PFOS+PFHxS (0.006 µg/L)
		POT126	PFOS+PFHxS (0.003 µg/L)
		POT127	PFOS+PFHxS (0.003 µg/L)
		POT130	PFOS+PFHxS (0.004 µg/L)
		POT131	PFOS+PFHxS (0.006 µg/L)
		POT198	PFOS+PFHxS (0.003 µg/L)
		POT201	PFOS+PFHxS (0.002 µg/L)
		The above listed seven private property samples from January 2025 all reported a first-time detection of PFOS+PFHxS concentrations. Previous analysis utilised the standard LOR (0.01 µg/L), whereas low-level has been conducted in 2025 to detect PFAS compounds at lower concentrations (LOR is 0.002 µg/L). Low-level analysis was selected for specific wells, as discussed in **Section 5.1.1** and listed within **Table 7**.	
End of wet season	Arndt Rd	MW814	PFOS (0.04 µg/L) PFOS+PFHxS (0.06 µg/L)
	Gorge Rd	MW815	PFOA (0.003 µg/L) PFOS (0.102 µg/L) PFOS+PFHxS (0.187 µg/L)

PFAS concentrations above the designated zone management area concentration ranges reported during the monitoring period are presented in **Table 15** to **Table 17** below.

Table 15 Groundwater analytical results - Dry season 2024 - Reported concentration above an expected zone area

Assigned Zone	Private Property Event October 2024	Annual Event October 2024

Assigned Zone	Private Property Event February 2025	Private Property Event March 2025	Private Property Event April 2025	Biannual Event April/May 2025
1 – Groundwater > Recreation Water Criterion (2 µg/L)	Nil	Nil	Nil	Nil
2 – Groundwater > Drinking Water Criterion (0.07 µg/L)	Nil	Nil	Nil	Nil
5 – Groundwater < Criterion (<0.07 µg/L)	OTH117 (0.113 µg/L) POT113 (0.498 µg/L)	POT113 (0.380 µg/L)	POT113 (1.630 µg/L)	MW815 (0.187 µg/L)

During the monitoring period, the following new location-specific maximum concentrations per seasonal sampling event of PFOS, PFOS+PFHxS, PFOA and PFBS were reported and are summarised in **Table 18** below.

Table 18 Groundwater results - new maximum concentrations of PFOA, PFOS and PFOS+PFHxS

Monitoring event	Area	Location	Analyte	Previous maximum (µg/L)	New maximum (µg/L)
Dry season (October-December 2024)	Base Boundary	MW118	PFOS	1.72	1.87

7.2 Surface water

7.2.1 Overview

Surface water data graphically represented in **Appendix A** on the following figures:

- **Figure F1**: location of key surface water features, PFAS sources and pathways
- **Figure F4**: location of on- and off-base surface water monitoring locations
- **Figure F8.1, F8.3, F8.5 and F8.7**: concentrations of PFOS+PFHxS for on-base and off-base surface water locations
- **Figure F8.2, F8.4, F8.6 and F8.8**: concentrations of PFOA for on-base and off-base surface water locations.

Surface water features within the PFAS Management Area consist of the RAAF Base Tindal runway drainage lines, Tindal Creek, Katherine River and the Katherine Hot Springs. In addition, the water within the Katherine Town Council Community Swimming Pool is categorised as a surface water feature (although not a natural water feature). All surface water (excluding the swimming pool) in the subject drains flow towards and eventually discharge into the Katherine River. There are also locations where surface water interacts with groundwater through springs, and where surface water infiltrates into groundwater via sink holes within the Tindall Limestone formation.

Surface water sampling was conducted on-and off-base during the monitoring period as presented in **Table 20.**

Table 20 Surface water sampling schedule June 2024 - April 2025

Monitoring event	Locations
June 2024 - October 2024 (Dry season)	Katherine River, Katherine Hot Springs and Katherine Town Council Swimming Pool
November 2024 - January 2025 (Start of wet season)	On-base, Katherine River, Katherine Hot Springs, Tindal Creek and Katherine Town Council Swimming Pool
February 2025 - April 2025 (End of wet season)	On-base, Tindal Creek, Katherine River, Katherine Hot Springs and Katherine Town Council Swimming Pool

7.2.2 Surface water field parameters

Measurements of surface water quality parameters were recorded at the time of collecting samples. The recorded water quality parameters are presented in each of the respective factual reports in **Appendix B** and results are provided in full as **Table T3** (**Appendix C**).

The readings for the monitoring period are also summarised in **Table 21**. These results are considered consistent with previous investigations.

From observations at the two surface water locations which were monitored quarterly (SW108 and SW153), it is noted that surface water conditions varied greatly based on the timing of the monitoring event. Average dissolved oxygen (DO), electrical conductivity (EC), pH, temperature and reduction / oxidation (redox) have been recorded on a quarterly basis for these two locations and are presented in **Table 21**.

Table 21 Surface water quality parameters ranges

Event	No. of samples	DO (mg/L)	EC (µS/cm)	pH	Corrected redox potential (mV)	Temperature (°C)
October 2019 – April 2025 (Historical)	134	0.53 (SW153) – 7.54 (SW108) *Poor to well oxygenated conditions*	25.20 (SW110) - 2,843 (SW108) *Freshwater to brackish conditions*	5.13 (SW153) – 8.12 (SW016) *Acidic to alkaline conditions*	157.6 (SW161) – 662.2 (SW108) *Oxidising conditions*	21.2 (SW100) – 35.8 (SW049)
June 2024 - October 2024 (Dry season)	6	2.91 (SW153) – 7.18 (SW100) *Oxygenated conditions*	161.2 (SW110) - 825 (SW153) *Freshwater conditions*	5.13 (SW153) - 7.13 (SW108) *Acidic to neutral conditions*	191.90 (SW108) – 353.4 (SW153) *Oxidising conditions*	28.3 (SW108) – 33.8 (SW108)
November 2024 - January 2025 (Start of wet season)	6	0.68 (SW016) – 7.54 (SW108) *Poor to well oxygenated conditions*	79.3 (SW161) – 809.0 (SW153) *Freshwater conditions*	5.34 (SW161) – 8.17 (SW153) *Mildly acidic to mildly alkaline conditions*	168.7 (SW350) – 313.5 (SW153) *Oxidising conditions*	27.7 (SW016) – 34.6 (SW350)
February 2025 - April 2025 (End of wet season)	11	1.23 (SW049) – 4.34 (SW161) *Poor to oxygenated conditions*	40.7 (SW161) - 852 (SW021) *Freshwater conditions*	7.15 (SW108) - 8.51 (SW021) *Neutral to alkaline conditions*	251.1 (SW021) - 319.1 (SW100) *Oxidising conditions*	27.6 (SW049) - 32.1 (SW110)

Water quality parameters presented above have excluded OTH008 (Katherine Swimming Pool) measurements as they are not reflective of natural surface water conditions.
Note: DO = dissolved oxygen; EC = electrical conductivity, values for water parameters presented as (min – max)

7.2.3 Surface water PFAS analytical results

All surface water analytical results for all monitoring events are presented in **Table T4 (Appendix C**). Analytical results for PFOS+PFHxS are presented in **F8.1, F8.3, F8.5 and F8.7** (**Appendix A**) and PFOS concentrations in **F8.2, F8.4, F8.6 and F8.8** (**Appendix A**)

Surface water results for all sampling events within the monitoring period are summarised in **Table 22**. No new maximum PFAS concentrations were reported. No new minimum PFAS concentrations were recorded over the monitoring period. Interpretation of results is provided in **Section 8.5**.

Table 22 Summary of PFOS, PFOA and PFOS+PFHxS concentrations in primary surface water samples

Monitoring event	No. of sample locations analysed	Compound	Concentration range for reporting period (>LOR) (µg/L)	No. of sample locations with concentrations >LOR	No. of samples exceeding drinking water criteria (HEPA, 2025)	No. of samples exceeding recreational water criteria (HEPA, 2025)	No of samples exceeding freshwater 99% species protection criteria (HEPA, 2025) **
June 2024 - October 2024 (Dry season)	7	PFOS	<0.01 to 0.16 (SW100)	6	3	0	6
		PFOA	<0.01 (All locations)	0	0	0	0
		PFOS+PFHxS	<0.01 - 0.27 (SW100)	6	3	0	N/A
November 2024 - January 2025 (Start of wet season)	9	PFOS	<0.01 – 1.37 (SW140)	7	5	0	7
		PFOA	<0.01 - 0.43 (SW140)	1	0	0	0
		PFOS+PFHxS	0.01- 1.74 (SW140)	8	6	0	N/A
March 2025 - April 2025 (End of wet season)	11	PFOS	<0.01 – 15.0 (SW049)	7	5	1	7
		PFOA	<0.01 - 0.75 (SW049)	4	1	0	0
		PFOS+PFHxS	<0.01 – 20.2 (SW049)	7	5	1	N/A

N/A – Criteria not applicable

There were no first-time detections or new exceedances of the adopted assessment criteria reported in surface water during the current two-year monitoring period. Additionally, there were no locations with new specific maximum concentrations of PFOS, PFOS+PFHxS and / or PFOA.

During the current twelve-month monitoring period the following new location specific minimum concentrations per seasonal monitoring event of PFOS, PFOS+PFHxS and / or PFOA were reported and are presented in **Table 23**.

Table 23 Surface water results - new minimum concentrations of PFOA, PFOS and PFOS+PFHxS

Monitoring event	Area	Location	Analyte	Previous minimum	New minimum
June 2024 - October 2024 (Dry season)	N/A	Nil	Nil	Nil	Nil
November 2024 - January 2025 (Start of wet season)	N/A	Nil	Nil	Nil	Nil
February 2024 - April 2025 (End of wet season)	On-base	SW140	PFOA	0.13	0.04
			PFOS	1.14	0.80
			PFOS+PFHxS	1.39	0.99

N/A – not applicable

7.3 Aquatic biota

7.3.1 Overview

Aquatic biota monitoring within Katherine River is conducted annually at the end of the dry season (September/October). Aquatic biota is monitored to track changes in PFAS concentrations in fish and crustaceans within Katherine River over time and to inform the Northern Territory Department of Health (NT Health) for keep their health advisory up to date. Aquatic biota samples are collected by NT Fisheries staff utilising NT Fisheries equipment.

7.3.2 Aquatic biota analytic results

Available aquatic biota analytical results are presented in **Table T5** (**Appendix C**) and monitoring locations are presented in **Figure F5** (**Appendix A**). Summary of PFOS, PFOS+PFHxS and PFOA analytical results for the monitoring period are presented in **Table 24**. Interpretation of results is provided in **Section 8.6**.

Table 24 Summary of PFOS, PFOA and PFOS+PFHxS biota sampling (Dry Season, October 2024)

Date	No. of samples analysed	Compound	Sample concentration range (mg/kg)	No. of sample locations with concentrations >LOR	No. of Samples exceeding 2-6 years* Finfish (all species) (FSANZ, 2017)	No. of Samples exceeding 2-6 years* Crustaceans (all species) (FSANZ, 2017)
Stuart Highway Boat Ramp - BIO088						
15 October 2024	16 samples (13 fin fish and 3 crustaceans)	PFOS	0.013 (BIOAFA444, BIOAFA461) - 0.142 (BIOAFA459)	13	12	0
		PFOA	<0.001	0	0	0
		PFOS+PFHxS	0.008 (BIOAFA489) - 0.103 (BIOAFA492)	13	2	0

8.0 Interpretive analysis

8.1 Hydrogeology

The SWLs were measured in groundwater monitoring wells and converted to estimated groundwater elevations (in mAHD). Depth to groundwater measurements are presented in **Table T1a** (**Appendix C**) and the inferred potentiometric contours for the monitoring wells for the October 2024 and April/May 2025 monitoring events are presented in **Figures F6.1 – F6.2** (**Appendix A**) respectively. Base-wide groundwater elevation data collected for presentation of potentiometric contours was collected during a separate gauging event documented in Dry Season SER 2024 (AECOM, 2025b) and End of Wet Season SER 2025 (AECOM, 2025d) in **Appendix B**. Further groundwater elevation discussion can be found in **Section 7.1.3.**

The inferred groundwater flow direction during the April/May 2025 monitoring event (the most recent in which groundwater levels were recorded) was to the west, which is consistent with historical observations / measurements. The range of recorded groundwater levels across the monitoring area is presented in **Table 25**, with the lower number showing the lowest groundwater elevation recorded furthest west near Katherine River, and the highest groundwater elevation recorded furthest east on base.

Table 25 Recorded groundwater elevations 2021 - 2025

Year of sampling event	Recorded groundwater range (mAHD)
2021	96.24 to 137.29
2022	92.32 to 130.61
2023	91.24 to 129.92
2024	89.55 to 137.21
2025	89.59 to 133.53

The range in elevations recorded in 2024 and 2025 are slightly larger compared to that recorded during previous events.

Reduced rainfall infiltration through the dry season typically results in groundwater elevation decreasing by up to approximately 8 metres from the end of the wet season to the end of the dry season. The water level reduction appears to have minimal impact on groundwater flow direction but may alter the rate of PFAS migration due to fluctuating hydraulic gradients. These can change sporadically, influenced by rainfall patterns, which can be highly localised within the monitored area.

Further, the mass discharge of PFAS from source areas is expected to be higher during the wet season, when the water table rises and mobilises PFAS from the dry season vadose zone.

Historical groundwater levels from registered bores do not show long-term rising or falling trends, indicative of hydraulic response in a very transmissive aquifer. The major springs on the river are the discharge points for these systems (Coffey, 2018a). Groundwater expression areas have also been observed in Tindal Creek on base, where PFAS impacted groundwater expresses intermittently into surface water that flows directly into Tindal Creek (AECOM, 2025f).

8.2 Groundwater first-time detections and new maximum concentrations

Groundwater concentrations for PFOA and PFOS+PFHxS, compared to assessment criteria and historical results in **Table T2** (**Appendix C**). Whilst PFBS and PFHxS values are now available for assessment under the revised drinking water guidelines, risk is predominantly discussed with relevance of PFOA and PFOS+PFHxS concentrations, and future reporting will include reviews.

PFAS concentrations were similar to those previously reported (historical) since the 2018 DSI (Coffey, 2018a). The highest PFAS concentrations reported in the monitoring period were detected at a monitoring well located within the former FTA (MW803D), which had a PFOS+PFHxS concentration of 8,170 µg/L during the May 2025 sampling event, and where remediation actions have recently been completed.

The highest PFOS+PFHXS concentrations reported in the monitoring period for off-base locations were detected at:

- MW400 (2.21 µg/L), located in Katherine East, in October 2024. This sampling location is an impacted well located in the centre of the plume off-base.
- MW134 (2.06 µg/L), located in Katherine research station, in May 2025. This location is an impacted well located in the centre of the plume off-base. This well was not sampled in earlier rounds due to a blockage. The well was cleared by air blasting in November 2024.

8.2.1 First time detections of PFOA and / or PFOS+PFHxS

First-time detections of PFOA and / or PFOS + PFHxS reported during the monitoring period include:

- First time detections of PFOS+PFHxS were reported at the following private bores in the Cossack area during the start of wet season sampling event. It should be noted that these detections coincide with the adoption of low-level analysis, where the limit of reporting is reduced to 0.002 µg/L, at each of the following locations:
  - POT125 (0.006 µg/L)
  - POT126 (0.003 µg/L)
  - POT127 (0.003 µg/L)
  - POT130 (0.004 µg/L)
  - POT131 (0.006 µg/L)
  - POT198 (0.003 µg/L)
  - POT201 (0.002 µg/L).
- First time detection of PFOS (0.04 µg/L) and PFOS+PFHxS (0.06 µg/L) was reported for MW814, which is related to the first time sampling result to replace monitoring at POT122, located west of the Katherine River in the centre of the plume. Sampling was conducted at the end of wet season 2025 sampling event, and exceeded drinking water and ecological criteria for PFOS.
- First time detection of PFOA (0.003 µg/L), PFOS (0.102 µg/L), PFHxS (0.085 µg/L) and PFBS (0.015 µg/L) was reported for MW815 during the end of wet season 2025 sampling event. MW815 is considered a northern boundary sentinel well which replaces the previously sample location POT119, and results are for the first time sampling. The reported concentrations for PFOA and PFOS were reported above adopted drinking water criteria, and PFOS above ecological criteria.

8.2.2 New maximum concentrations of PFOA and / or PFOS + PFHxS

New maximum concentrations for PFOA and / or PFOS + PFHxS were reported during the monitoring period at twelve locations, all new maximums are detailed above in **Table 18** which are within close range of previous historical maximums, with the exception of:

- At MW803D, located immediately down gradient of the FTA remediation zone, concentrations of PFOS+PFHxS rose from a previous historical maximum of 2,520 µg/L to 8,170 µg/L during the October 2024 sampling event. This result was reported when sampling occurred during the FTA remediation civil works, where disturbed soils from earth moving activities likely contributed to a temporary increased in PFAS mass released from the pore space in the exposed soils. Results fell to historical norms in the subsequent months after works were completed in November 2024, which included compaction and capping of treated soils.

There have been no new notable detections at the southernmost sentinel wells located off-base (MW403, POT111 and MW144) indicating that the plume extent in the southern portion has not expanded to the sentinel wells.

The previous northern sentinel well (POT119) was replaced by MW815 prior to this sampling period due to inaccessibility of the well. POT119 had not been sampled since April 2021 and had not recorded any detectable levels of PFAS during that or prior sampling rounds. MW815 recorded concentrations above drinking water criteria when first sampled in May 2025, these results were confirmed by resampling in early June 2025. This may indicate that the extent of the migration of the plume has increased north since 2021.

MW136, located further north along Gorge Road was sampled for the first time since 2017, recording its highest PFOS concentration (0.05 µg/L) above ecological criteria during the October sampling round, when resampled in May MW136 recorded no detectable levels of PFAS. Due to the lack of sample locations between MW815 and MW136 or further along the northern plume boundary, identification of the northern boundary extent of the plume is currently incomplete.

The spatial and magnitude concentration trends indicate that the PFAS plume may be migrating westward within the Cossack area, particularly at the end of the wet season. The mechanism for this observed westward expansion is not currently understood and may be associated with localised groundwater flow dynamics, preferential pathways within the aquifer, surface water levels and flows in Katherine River, and/or groundwater extraction in the area. The interaction between these potentially completing hydrological processes is being assessed separately from the OMP.

8.3 Management zone limit exceedances

New reported concentrations of PFOA and PFOS + PFHxS greater than their expected zone area reported during the monitoring period include:

8.3.1 Dry season 2024

- POT112, located in groundwater zone 5 (< Criteria) reported concentrations of PFOS+PFHxS (0.18 µg/L) above the 0.07 µg/L upper limit during the October 2024 sampling event. POT112 has consistently reported concentrations of PFOS and PFOS+PFHxS above the LOR since its first sampling in November 2017, ranging between 0.02 µg/L (April 2024) and 0.14 µg/L (January 2024).
- MW400, located in groundwater zone 1 (> Recreational & Drinking water criteria) reported concentrations of PFOS+PFHxS (2.21 µg/L) above the 2.00 µg/L upper limit during the October 2024 sampling event. MW400 is located in the centre of the plume, and this result is within historical ranges for the location.

8.3.2 Start of wet season 2024 - 2025

- POT112, located in groundwater zone 5 (< Criteria) reported concentrations of PFOS+PFHxS above the 0.07 µg/L upper limit of 0.09 µg/L and 0.10 µg/L being recorded in November and December sampling events respectively.
- POT113, located in groundwater zone 5 (< Criteria) reported concentrations of PFOS+PFHxS above the 0.07 µg/L upper limit of 0.13 µg/L, 0.09 µg/L and 0.018 µg/L being recorded in November, December and January sampling events respectively.

8.3.3 End of wet season 2024 - 2025

- OTH117, located in groundwater zone 5 (< Criteria) reported concentrations of PFOS+PFHxS (0.113 µg/L) above the 0.07 µg/L upper limit during the February 2025 sampling event.
- POT113, located in groundwater zone 5 (< Criteria) reported concentrations of PFOS+PFHxS above the 0.07 µg/L upper limit of 0.498 µg/L, 0.380 µg/L and 1.630 µg/L being recorded in February, March and April sampling events respectively.
- MW815, located in groundwater zone 5 (< Criteria) reported concentrations of PFOS+PFHxS (0.187 µg/L) above the 0.07 µg/L upper limit during the May 2025 sampling event. The well was resampled with the result confirmed in early June 2025.

8.4 Groundwater – temporal trends

8.4.1 Approach to trend analysis

A summary of PFOS, PFOS+PFHxS and PFOA concentrations (includes all current and historical data) for eight sub-regions within the Management Area is specified in **Table 26** (below) and trend analysis results are discussed and presented in tabular form **Section 8.4.3** to **Section 8.4.9**. Temporal graphs and Mann-Kendall statistical trend analysis for each of the seven sub- regions are presented in **Appendix D** and **Appendix E**, respectively.

The laboratory standard LOR for PFOS, PFOS+PFHxS, and PFOA concentrations is 0.01 µg/L, indicating that concentrations below this threshold are not quantifiable by the laboratory methods used. Low level analysis was conducted for locations usually reported below the standard LOR to understand low concentration lateral distribution of PFAS to the west of Katherine River, and meet reporting requirements for the revised drinking water criteria, which require reduced laboratory LORs (0.002 µg/L) for assessment. Locations that had insufficient data (i.e. less than four data points) or concentrations that were reported below the LOR are labelled with "*not completed (nc)*" next to location ID.

Locations utilising alternative wells are included in **Appendix E** but are not considered for reported trends. Limitations of Mann-Kendall analysis is discussed in **Section 8.4.2**, with particular regard for the impacts that seasonality has on the appropriateness of adopting Mann Kendall to undertake a statistical trend analysis.

Table 26 Summary of sub-regions for the groundwater monitoring area

Sub-region within the management area	Groundwater monitoring well IDs
On-base cross/upgradient	MW133, MW403, OTH111, OTH112,
On-base FTA	MW104, MW231, MW803D, MW803I, MW803S
On-base minor source areas (MEOMS, Fuel Farm 1 and Fuel Farm 2)	MW244, MW278, MW285
On-base FSA	MW127, MW129, MW146, MW149, MW802D, MW802I, MW802S,
On-base central and boundary plume	MW106, MW107, MW109S, MW109D, MW110, MW111D, MW111S, MW117*, MW118S*, MW118D, MW118I, MW119, MW130, MW131, MW732*, MW801S
Off-base central transects	MW134 (MW732*), MW135, MW400, POT111
Off-base at the Katherine Township	MW136, MW137, MW138 (OTH116*), MW140, MW142, MW144, MW815, OTH113, OTH115,
Off-base and west of Katherine River	MW814, OTH114, OTH117, OTH118, OTH119, OTH120, POT112, POT113, POT114, POT120, POT121, POT124, POT125, POT126, POT127, POT128, POT129, POT130, POT131, POT198, POT201

* Alternative location sampled in lieu of primary location being unable to sample – cells highlighted red in **Appendix E** where the alternative location concentration has been used.

The groundwater temporal graphs only include locations which consistently report greater than the LOR for respective analytes. Where sample results were less than the LOR, half the LOR was adopted for graphing purposes, which is one of several options advised by ANZG (2018) in this scenario. All data substitution approaches have shortcomings and the potential to introduce bias into a modified dataset, especially if a large portion of the data are recorded as <LOR, as the substitutions can amplify the sample variance from the value modifications. For this reason, temporal data plotting has been limited to datasets with values consistently >LOR. It is also noted that LORs have been based on the drinking water quality guidelines, and hence these plots allow depiction of trends in relation to current drinking water advisory, even where resolution is lost when values are reported less than the LOR. In performing the substitution of half-LOR values, this approach is not considered to impact on the objectives of this report and ability to adequately interpret the results.

Table 27 summarises the wells selected for the temporal graphs per sub-region.

Table 27 Summary of locations selected for groundwater temporal plots

Sub-region	Groundwater monitoring well IDs	Analyte	Graph ref
On-base cross/upgradient	MW133, MW403, OTH111, OTH112	PFOA	**G1**
		PFOS+PFHxS	**G2**

Sub-region	Groundwater monitoring well IDs	Analyte	Graph ref
On-base FTA	MW104, MW231, MW803D, MW803I, MW803S	PFOA	**G3**
		PFOS+PFHxS	**G4**
On-base minor source areas (MEOMS, Fuel Farm #1 and #2)	MW244, MW278, MW285	PFOA	**G5**
		PFOS+PFHxS	**G6**
On-base FSA	MW127, MW129, MW146, MW149, MW802D, MW802I, MW802S	PFOA	**G7**
		PFOS+PFHxS	**G8**
On-base central and boundary plume	MW107, MW110, MW117, MW118	PFOA	**G9**
		PFOS+PFHxS	**G10**
	MW134, MW135, MW732, MW400	PFOA	**G11**
		PFOS+PFHxS	**G12**
Off-base in Katherine	MW137, MW138, MW140, OTH116	PFOA	**G13**
	MW136, MW137, MW138, MW140, MW142, MW144, OTH113, OTH115	PFOS+PFHxS	**G14**
Off-base and west of Katherine River	POT113, POT201, OTH114, OTH119	PFOA	**G15**
	OTH114, OTH117, OTH118, OTH119, POT112, POT113, POT114, POT120, POT121, POT122, POT124, POT125, POT127, POT128, POT129, POT130, POT131, POT198, POT201	PFOS+PFHxS	**G16a-c**

8.4.2 Limitations of trend analysis

Statistical trend analysis was undertaken for select sub-regions of the Management Area. However, due to seasonal variation of precipitation, corresponding fluctuations in groundwater levels, and seasonally influenced variance in PFAS concentrations, there are currently insufficient data to reliably identify statistical trends for all locations. This is particularly noticeable when examining temporal graphs (**Appendix D**) where seasonal variance was present at several locations.

Additionally, Mann-Kendall statistical analysis has limited capability to accurately identify temporal changes when concentrations are close to the LOR. Mann-Kendall analysis is considered a tool for detecting single variable trends, such as concentrations of PFAS, and is a robust approach to nonparametric datasets. However, limitations of this analysis in the current application to the base and surrounds include the potential for extraneous variables such as seasonal variation and the aquifer conditions to potentially generate false-positive or false-negative trend outputs, such as incorrectly ascribing concentration changes to remediation efforts. To this end, the current Mann-Kendall approach is employed as an ‘exploratory’ first step, assessing coarse trends across the monitoring area, with future investigations to consider approaches that can interpret multiple variables such as seasonality, multi-variable statistical tests, nonlinear regression or a multiple regression model.

Further monitoring is required before statistical trends in seasonal variability can be effectively assessed. Collection of groundwater samples during both wet and dry season conditions has been conducted only once (2024) since the start of the OMP in 2019. As groundwater samples have only been collected twice at the end of the wet season there are insufficient data available to evaluate temporal trends between and within wet and dry season conditions. The current OMP (Defence, 2025a) prescribes biannual sampling at all on- and off-base groundwater sampling locations, which should allow for accurate trends analysis once additional monitoring years are completed.

Tracking of changes in the nature and location of PFAS throughout the Management area will become more relevant following the recent remedial activities. Data from multiple monitoring events after remediation actions are completed will be required before meaningful data trends can be discerned.

8.4.3 On-base cross and upgradient trends

Monitoring locations MW133 (northern perimeter), MW403 (southern perimeter), OTH111 (across- and up-gradient) and OTH112 (up-gradient of sources) represented locations on-base cross gradient or upgradient of the on-base PFAS source areas.

Historical concentrations of PFOA in the on-base cross and upgradient locations are shown graphically in **Graph G1** (**Appendix D**). Reported PFOA concentrations within this region of the Management Area remain below the laboratory LOR and therefore there is no observable trend to discuss.

Historical concentrations of PFOS+PFHxS in the subject on-base cross and upgradient locations are shown graphically in **Graph G2 (Appendix D**) and the PFOS and PFOS+PFHxS concentrations for the current monitoring period are summarised in **Table 28** below, and presented in full as **Table T2** (**Appendix C**).

While no discernible trends are identifiable from temporal graphs **Graph G1** and **G2** for any on-base cross and upgradient locations, the consistency in low to non-detectable concentrations indicate that the northern, eastern and southern extents of the plume have not spread, hence the northern, eastern and southern extent of the Management Area remains unchanged. However, OTH111, which first had a detection of PFOS+PFHxS in 2021, reported a historical high concentration of 0.054 µg/L in May 2025. It should be noted that this is the first time this location has been sampled during wet season conditions since April 2021, and therefore it is possible that the concentration recorded here is not outside the normally expected concentration range for late wet season conditions. Additional wet season sampling will need to be conducted to determine if this concentration is representative of this location, if there is an emerging trend, or if the May 2025 result is an anomaly.

Table 28 Groundwater summary results - On-base cross and upgradient

Location ID	Analyte	Historical range[1] (µg/L)	OMP Events (OMR July 2024 - May 2025) (µg/L)		
			Dry season (July 2024 - October 2024)	Start of wet season (November 2024 - January 2025)	End of wet season (February 2025 - May 2025)
MW133 (Northern perimeter)	PFOS	<LOR	0.01	n/s	<LOR
	PFOS+PFHxS	<LOR	0.03	n/s	0.006
	PFOA	<LOR	<LOR	n/s	<LOR
MW403 (Southern perimeter)	PFOS	<LOR - 0.02	0.02	n/s	<LOR
	PFOS+PFHxS	<LOR - 0.02	0.02	n/s	<LOR
	PFOA	<LOR	<LOR	n/s	<LOR
OTH111 (across and up-gradient)	PFOS	<LOR - 0.02	<LOR	n/s	0.049
	PFOS+PFHxS	<LOR - 0.02	<LOR	n/s	0.054
	PFOA	<LOR	<LOR	n/s	<LOR
OTH112 (up-gradient)	PFOS	<LOR - 0.01	<LOR	n/s	<LOR
	PFOS+PFHxS	<LOR - 0.01	<LOR	n/s	<LOR
	PFOA	<LOR	<LOR	n/s	<LOR

n/s = not sampled

[1] historical data range since monitoring commenced in 2017 prior to current OMR monitoring period.

Orange shading indicates one or more results above the historical range.

In periods with multiple sampling events, the maximum value for the period is presented.

PFOS+PFHxS data are also visualised in boxplots, in **Figure 4**. For this analysis, <LOR values were replaced with the LOR which represents a conservative assumption that <LOR values represent the maximum possible concentration (ANZG, 2018).

Data from this area are atypically high concentrations in the current event, (i.e. values reported greater than the overall 75th percentile of the dataset, represented by the 'top edge' of the 'box' in each plot). These are dry season samples in the case of MW133 and MW403, and an end of wet season sample in the case of OTH111. Additionally, MW133 exhibited an atypically low end of wet reading at MW133 (i.e. falling below the 25th percentile 'lower box edge). These results indicate variability in concentrations and may suggest additional temporal and spatial data are warranted to determine if these potential outliers are statistically significant.

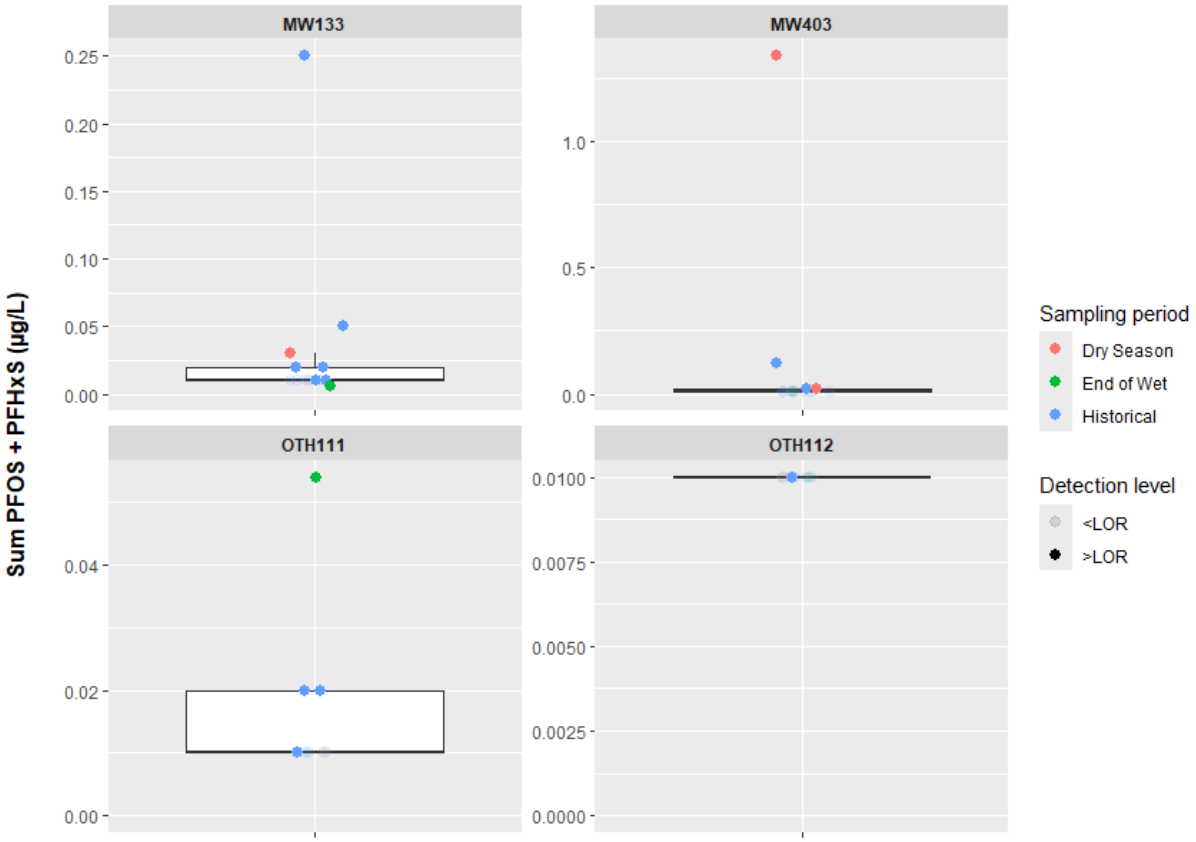

Figure 4 Boxplots showing historical and current PFOS + PFHxS concentrations at on-base cross and upgradient areas

8.4.4 On-base FTA trend analysis

The FTA is one of the two key on-base source areas for PFAS in groundwater and is monitored through five groundwater wells. Monitoring location MW235 was decommissioned prior to remediation works at the FTA. As mentioned in **Section 6.2**, this source area is listed as a priority for action under the PMAP with soil remediation completed in 2022 - 2024 and groundwater treatment ongoing.

Historical concentrations of PFOA and PFOS+PFHxS in these on-base FTA locations are shown graphically in **Graph G3** and **G4** (**Appendix D)** respectively. PFOS, PFOS+PFHxS and PFOA results are summarised in **Table 29**, and presented in full as **Table T2,** (**Appendix C**). All monitoring locations reported PFOS+PFHxS and PFOA concentrations above LOR for the monitoring period.

Table 29 Groundwater summary results - On-base FTA

Location ID	Analyte	Historical Range[1] (µg/L)	OMP events (OMR August 2024 - May 2025) (µg/L)		
		Min - Max	Dry season (August 2024 - October 2024)	Start of wet season (November 2024 - January 2025)	End of wet season (February 2025 - May 2025)
MW104	PFOS	3.74 - 2,200	53.9	n/s	31.6
	PFOS+PFHxS	5.52 - 2,990	68.3	n/s	40.7
	PFOA	0.23 - 180	2.96	n/s	1.61
MW231	PFOS	79.8 - 3,160	338	1,040	470
	PFOS+PFHxS	139 - 6,160	727	2,120	726
	PFOA	11.4 - 672	108	333	72.9
MW803D	PFOS	1,150 - 2,190	8,020	1,550	1,230
	PFOS+PFHxS	1,370 - 2,500	8,170	1,830	1,430
	PFOA	31.0 - 44.3	28.8	50.4	34.8
MW803I	PFOS	57.0 - 91.2	40.8	73.1	66.4
	PFOS+PFHxS	112 - 172	78.7	143	134
	PFOA	5.50 - 9.65	5.09	9.43	9.16
MW803S	PFOS	208 - 285	157	300	113
	PFOS+PFHxS	470 - 786	351	490	178
	PFOA	43.4 - 110	50.0	49.1	15.0

n/s = not sampled.

[1] historical data range since monitoring commenced in 2017, prior to current OMR monitoring period.

Green shading indicates one or more results below the historical range.

Orange shading indicates one or more results above the historical range.

In periods with multiple sampling events, the maximum value for the period is presented.

At MW231 in September 2024, PFOS, PFOS+PFHxS, and PFOA concentrations exceeded relevant criteria but remained within historical ranges. Compared to the previous monitoring events in October 2022 and 2023, a reduction in PFOS+PFHxS concentrations was observed. MW231 is located directly downgradient of the former FTA evaporation ponds, which have recently undergone remediation. Following remedial activities that occurred between 2022 and 2024, including the removal of evaporation ponds and excavation and treatment of impacted soils beneath and adjacent to the evaporation pond areas since September 2023, a reduction in PFAS mobilisation into groundwater at this location is anticipated.

The newly installed well MW803D recorded its highest PFOS and PFOS+PFHxS concentrations during the October 2024 dry season sampling event, which occurred immediately following remediation works. This peak may be attributed to the disturbance and subsequent release of PFAS from surrounding soils during earthworks. In contrast, the shallower wells MW803I and MW803S did not exhibit this immediate post-remediation spike. However, MW803S had PFOS, PFHxS and PFOA concentrations in February – May that were lower than any previous sample collected from this location between since the well's installation in 2022.

In summary, the data highlights the significance of seasonal influence on the oscillation of PFAS concentrations in groundwater, with the amplitude of concentration change directly proportional to the extent of groundwater intrusion / soil saturation and hence mobilisation of residual PFAS. Additionally, reductions in PFAS concentrations, particularly in concentrations of short chain PFAS compounds at MW803S, may be an early indicator that remedial actions since 2022 are reducing groundwater concentrations directly downgradient of the FTA.

PFOS+PFHxS data are also visualised in boxplots, in **Figure 5**. The results suggest potentially steady or reducing concentrations in these areas, as current sampling values fall within or below the overall 25th – 75th percentile range.

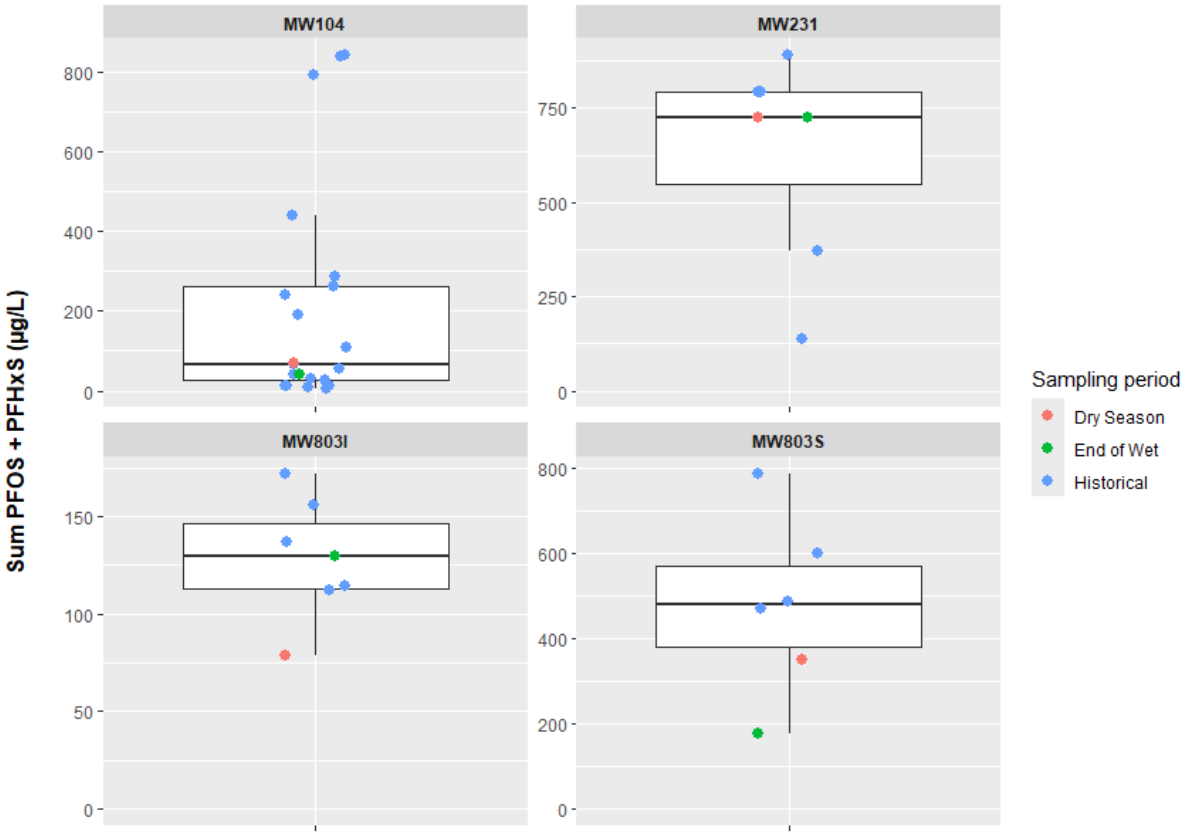

Figure 5 Boxplots showing historical and current PFOS + PFHxS concentrations at on-base FTA areas

8.4.5 On-base minor source areas trend analysis

The on-base minor source areas include the MEOMS (MW244), Fuel Farm 1 (MW278) and Fuel Farm 2 (MW285). All three monitoring wells were sampled during the biannual monitoring events in October 2024 and May 2025.

Historical concentrations of PFOA and PFOS+PFHxS in the vicinity of the on-base MEOMS, Fuel Farm 1, and Fuel Farm 2 areas are respectively shown graphically in **Graph G5** and **G6** (**Appendix D**). PFOS, PFOS+PFHxS and PFOA results are summarised in **Table 30**, and presented in full as **Table T2** (**Appendix C**).

No discernible trends are identifiable for MW278 and MW285 from temporal graphs **Graph G5** and **G6** (**Appendix D**) for any of the on-base minor source areas. Additional wet season data applied to a statistical analysis that accounts for seasonality would likely be needed to understand the PFAS concentration trends at these on-base minor source areas.

Table 30 Groundwater summary results - MEOMS, Fuel Farm 1 and Fuel Farm 2

Location ID	Analyte	Historical range[1] (µg/L)	OMP events (OMR August 2024 - May 2025) (µg/L)		
		Min - Max	Dry season (August 2024 - October 2024)	Start of wet season (November 2024 - January 2025)	End of wet season (February 2025 - May 2025)
MW244 (MEOMS)	PFOS	3.3 - 14	5.64	n/s	8.68
	PFOS+PFHxS	4.12 - 20.6	9.36	n/s	13.3
	PFOA	0.11 - 0.76	0.69	n/s	0.81
MW278 (Fuel Farm 1)	PFOS	2.7 - 15	7.66	n/s	7.53
	PFOS+PFHxS	8.74 - 26.1	11.6	n/s	10.7
	PFOA	0.11 - 0.35	0.20	n/s	0.12
MW285 (Fuel Farm 2)	PFOS	0.14 - 0.77	0.20	n/s	0.36
	PFOS+PFHxS	0.32 - 1.03	0.45	n/s	0.56
	PFOA	<LOR - 0.02	<LOR	n/s	<LOR

n/s = not sampled.

[1] historical data range since monitoring commenced in 2017, prior to current OMR monitoring period.

In periods with multiple sampling events, the maximum value for the period is presented. Orange shading indicates one or more results within the multiple events were reported above the historical range.

Concentrations of PFOA at MEOMS monitoring location MW244 in May 2025 (end of wet season) were reported to be above historical ranges and may be exhibiting an increasing trend, however, PFOA concentrations are within the same order of magnitude to historical ranges. MW278 and MW285 reported PFOS+PFHxS and PFOA concentrations within the historical concentrations range during the monitoring period.

PFAS concentrations reported from MEOMS, Fuel Farm 1 and Fuel Farm 2 have not shown significant changes in concentrations or reported constituent compounds since sampling was first conducted at these locations in 2016 / 2017. PFOS+PFHxS data are visualised in boxplots, in **Figure 6**.

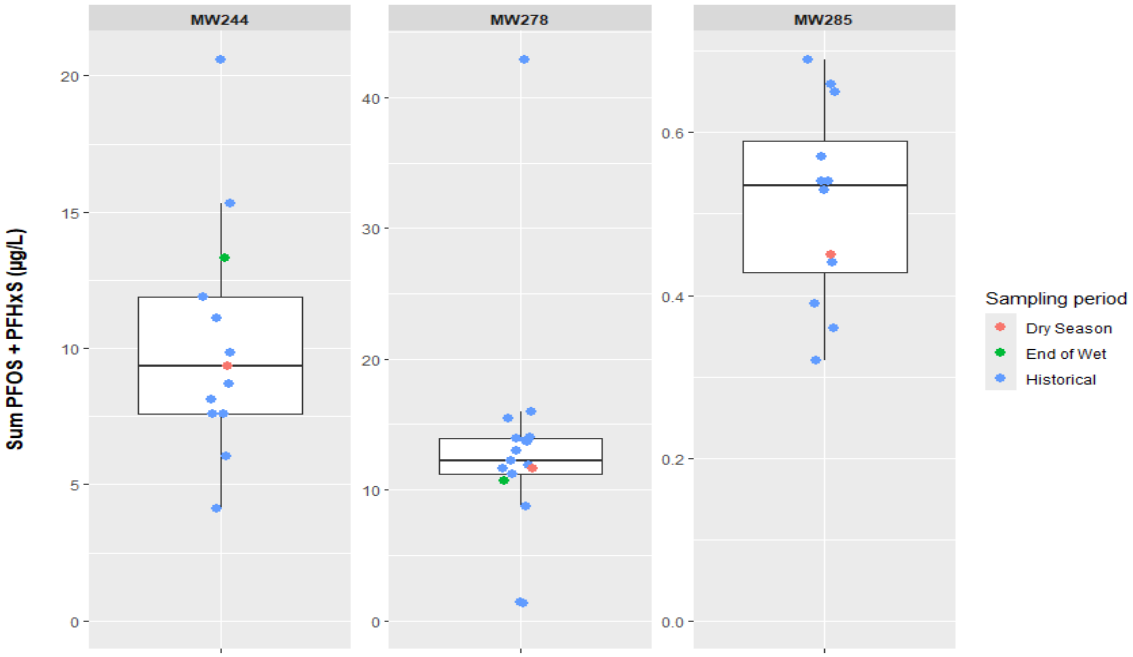

Figure 6 Boxplots showing historical and current PFOS + PFHxS concentrations at on-base minor source locations

8.4.6 On-base FSA trend analysis

The FSA is the second key source area and is located within the central part of base. All seven monitoring wells were sampled during the biannual monitoring event in October 2024 and May 2025.

Historical concentrations of PFOA and PFOS+PFHxS in the vicinity of FSA are shown graphically in **Graph G7** and **G8** (**Appendix D**). PFOS, PFOS+PFHxS and PFOA results are summarised in **Table 31**, and presented in full as **Table T2** (**Appendix C**).

Temporal graphs for these locations are presented in **Graph G7** and **G8** (**Appendix D**). No discernible trends are identified in the temporal graphs, while MW129, located in the FSA hardstand area, appears to be increasing in the more recently sampling events. These reported concentrations may be a result of temporary fluctuations and are not above historical results. Additional wet season data applied to a statistical analysis that accounts for seasonality would likely be needed to understand PFAS trends at the FSA.

Table 31 Groundwater summary results - On-base FSA

Location ID	Analyte	Historical range[1] (µg/L)	OMP events (OMR August 2024 - May 2025) (µg/L)		
		Min - Max	Dry season (August 2024 - October 2024)	Start of wet season (November 2024 - January 2025)	End of wet season (February 2025 - May 2025)
MW127	PFOS	1.1 - 26.8	2.34	n/s	3.52
	PFOS+PFHxS	1.53 - 30.2	3.45	n/s	4.92
	PFOA	0.04 - 0.56	0.08	n/s	0.11
MW129	PFOS	32.2 - 860	192	n/s	342
	PFOS+PFHxS	53.7 - 944	326	n/s	497
	PFOA	1.95 - 82.4	56.2	n/s	76.7
MW146	PFOS	15.6 - 151	47.8	n/s	38.7
	PFOS+PFHxS	20.4 - 202	71.2	n/s	52.9
	PFOA	0.67 - 3.51	1.69	n/s	1.55

Location ID	Analyte	Historical range[1] (µg/L)	OMP events (OMR August 2024 - May 2025) (µg/L)		
		Min - Max	Dry season (August 2024 - October 2024)	Start of wet season (November 2024 - January 2025)	End of wet season (February 2025 - May 2025)
MW149	PFOS	37.8 - 2,030	181	n/s	336
	PFOS+PFHxS	51.4 - 3,060	252	n/s	523
	PFOA	1.81 - 68	6.22	n/s	12.6
MW802D	PFOS	3.78 - 8.79	2.87	n/s	2.78
	PFOS+PFHxS	4.94 - 11.2	4.11	n/s	3.64
	PFOA	0.21 - 0.44	0.22	n/s	0.14
MW802I	PFOS	78.3 - 162	57.4	n/s	61.3
	PFOS+PFHxS	104 - 214	76.5	n/s	81.1
	PFOA	3.20 - 7.98	3.04	n/s	3.11
MW802S	PFOS	2.03 - 3.25	2.61	n/s	1.61
	PFOS+PFHxS	7.55 - 12.7	8.91	n/s	7.93
	PFOA	0.23 - 0.37	0.64	n/s	0.25

n/s = not sampled.

[1] historical data range since monitoring commenced in 2017, prior to current OMR monitoring period.

Green shading indicates one or more results below the historical range. Orange shading indicates one or more results above the historical range. In periods with multiple sampling events, the maximum value for the period is presented.

All results obtained during the current monitoring period for PFOS, PFHxS and PFOA were above the LOR for the monitoring period and were within or below the ranges of the historical data set, with minor fluctuation in the concentrations detected between sampling rounds.

PFAS concentrations in groundwater at the FSA remain similar to conditions described during the 2017 investigative period. Concentrations of PFAS are usually higher during the end of wet season sampling events. A review of temporal trend graphs **G7** and **G8** (**Appendix D**) indicates there may be a correlation between end of wet season conditions and higher recorded PFAS concentrations, however, data has not been regularly collected across both wet and dry season conditions to determine if such a correlation exists.

Monitoring location MW129 is located within the FSA hardstand area, and upgradient of the FSA remediation area. The recorded concentrations have not changed significantly since investigations began in 2017. FSA infrastructure appears to continue to contribute to PFAS migration into groundwater in the FSA area, and additional measures to reduce PFAS mobilisation from FSA infrastructure should be explored.

Monitoring location MW127, located approximately 200 metres downgradient of the FSA soil remediation area has not shown any reductions in PFAS concentrations compared to the historical monitoring data from this location. The distance of MW127 from the soil remediation area may be a contributing factor. Future groundwater monitoring events conducted at the FSA will be used to track any measurable decreases in PFAS concentrations in groundwater post soil remediation works.

Nested wells MW802S, MW802I and MW802S all have reported an overall decrease in PFOS, PFHxS and PFOA concentrations since installation in 2022.

PFOS+PFHxS data are also visualised in boxplots, in **Figure 7**.

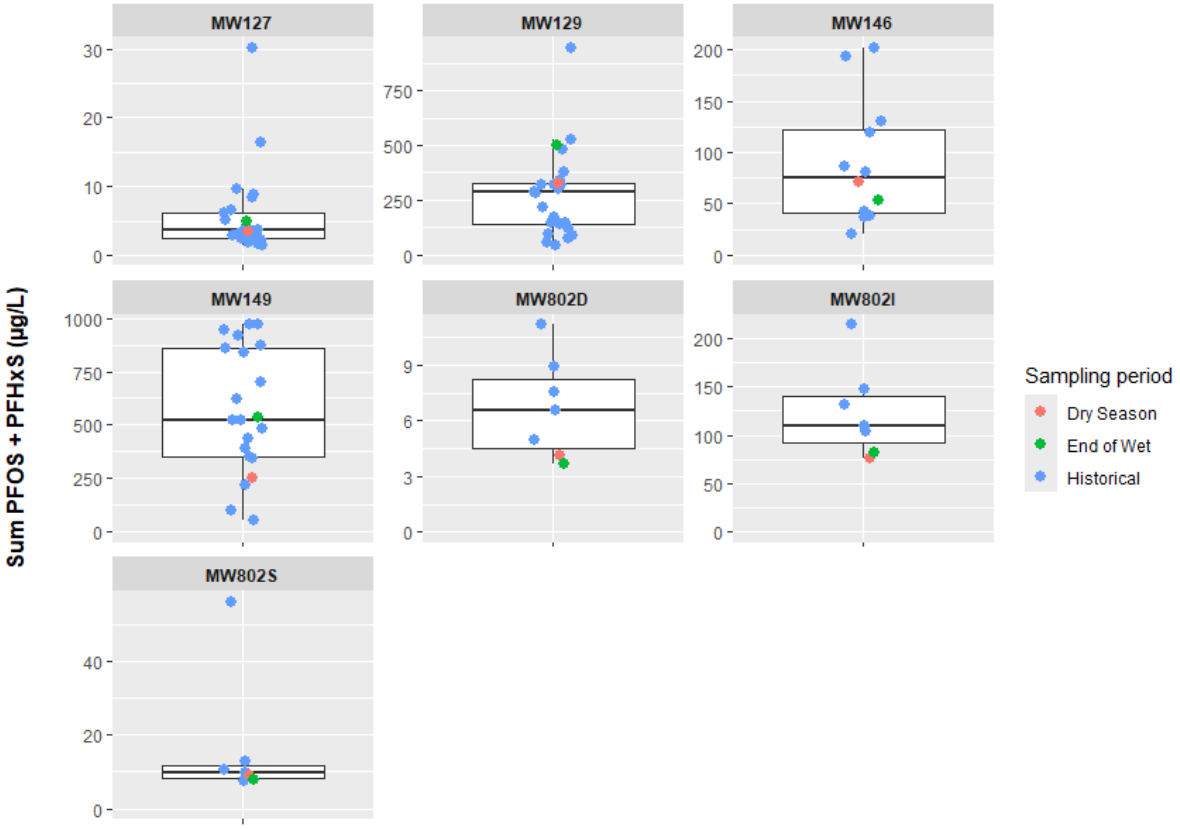

Figure 7 Boxplots showing historical and current PFOS + PFHxS concentrations at on-base FSA locations

Figure 7 indicates several samples as atypically low concentration in the on-base FSA areas, with one exception at MW129 (end of wet sample showing atypically high level).

8.4.7 Base boundary and central plume trend analysis

The central portion of the plume is assessed via seventeen monitoring locations, thirteen located on-base and four off-base. These monitoring wells are located to the west of the airfield, and extend to the suburb of Uralla, located directly west of the base.

Obstructions have been present in three monitoring wells since October 2021 and their alternate locations (detailed in **Section 3.4**):

- MW117, MW118 and MW119.

Historical concentrations of PFOA and PFOS+PFHxS in the in the central portion of the plume are shown graphically in **Graph G9 - G10** (**Appendix D**) for on-base locations, and **Graph G11 - G12** for off-base locations (**Appendix D**). Analytical results for PFOS, PFOS+PFHxS and PFOA are summarised in **Table 32**, and presented in full as **Table T2** (**Appendix C**). No discernible trends were identifiable from temporal graphs **Graph G9 - G12** (**Appendix D**).

Table 32 Groundwater summary results - Base boundary and central plume

Location ID	Analyte	Historical range[1] (µg/L)	OMP events (OMR August 2024 - May 2025) (µg/L)

n/s = not sampled

[1] historical data range since monitoring commenced in 2017, prior to current OMR monitoring period.

Green shading indicates one or more results below the historical range. Orange shading indicates one or more results above the historical range. In periods with multiple sampling events, the maximum value for the period is presented.

Boxplots showing historical and current PFOS+PFHxS concentrations at on-base areas are presented in **Figure 8** and at off-base locations in **Figure 9**.

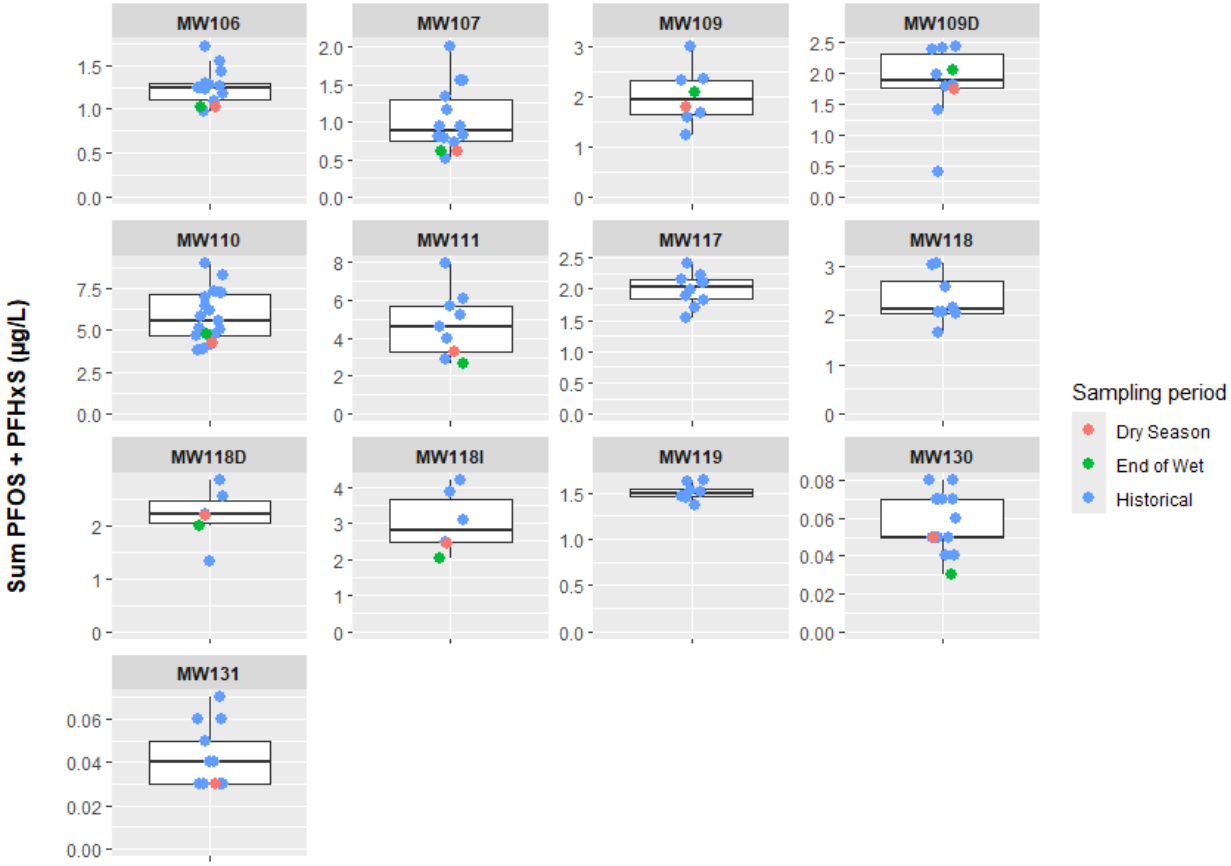

Figure 8 Boxplots showing historical and current PFOS + PFHxS concentrations at on-base locations

No increases in concentrations of PFOS, PFOS+PFHxS and PFOA were detected within samples collected during the monitoring period in this monitoring area. The plume conditions at / near the base boundary and within the central portion of the plume remain similar to conditions described during the 2017 investigative period.

Monitoring location MW400, located off base, reported new maximum PFOS concentrations of 1.51 µg/L, in October 2024. However, the reported was only marginally greater than the historical maximum and consistent with results recorded from this monitoring location. It should be noted that in May 2025 reported a new minimum concentration of 0.75 µg/L for PFOS and 1.12 µg/L for PFOS+PFHxS. New minimum concentrations were also reported at six locations on base over the two monitoring rounds.

Off-base monitoring location MW135, located at the Katherine Research Station, has reported PFOS+PFHxS concentrations above the historical average since 2021. This location tracks the northern edge of the PFAS plume in this area, and therefore the northern plume edge is not completely tracked at this location.

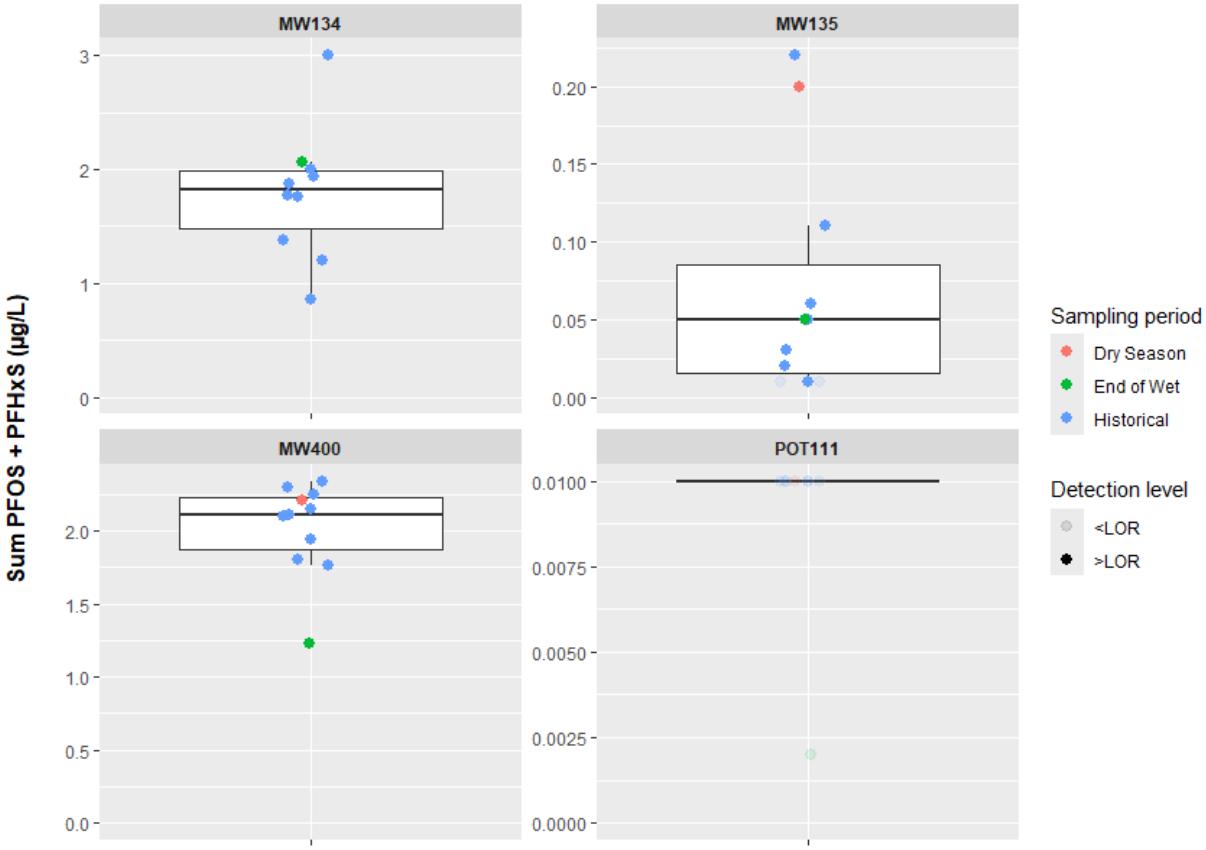

Figure 9 Boxplots showing historical and current PFOS + PFHxS concentrations at off-base locations

Figure 9 indicates one sample as atypically low concentration in the off-base areas, and two as atypically high. These results suggest additional temporal and spatial data may be warranted to determine if these shifts are statistically significant, and to resolve potential seasonal differences.

8.4.8 Off-base Katherine township (east of Katherine River) trend analysis

The off-base Katherine Township monitoring wells are located east of the Katherine River. There is a total of nine locations, which consist of a mixture of private property bores, Katherine Town Council extraction bores, and Department of Defence and Department of Environment, Parks and Water Security (DEPWS) monitoring wells. The locations are presented in **Table 33** below.

Historical concentrations of PFOA and PFOS+PFHxS in the downgradient / leading edge of the plume are shown graphically in **Graph G13** and **Graph G14 Appendix D**). PFOS, PFOS+PFHxS and PFOA results are summarised in **Table 33,** and presented in full as **Table T2** (**Appendix C**). No discernible trends were identifiable from temporal graphs **Graph G13** and **G14** (**Appendix D**).

Table 33 Groundwater summary results - Off-base Katherine Township

n/s = not sampled

[1] historical data range since monitoring commenced in 2017, prior to current OMR monitoring period.

In periods with multiple sampling events, the maximum value for the period is presented. Orange shading indicates one or more results above the historical range. Green shading indicates one or more results below the historical range.

Measured PFAS concentrations in all off-base Katherine Township groundwater monitoring locations have been recorded at or above the drinking water criteria during this monitoring period, except for MW144.

Monitoring location MW136 reported a historical high sum of PFOS+PFHxS concentration of 0.05 µg/L in October 2024. This location monitors the northern most portion of the PFAS plume east of Katherine River and serves as a sentinel well to monitor PFAS concentrations south of nearby private bore users. This location reported a PFAS concentration below the LOR when sampled during the end of wet season sampling event. Future monitoring under the OMP will continue to monitor PFAS concentration trends.

A review of temporal trend graphs **G13** and **G14** (**Appendix D**) indicated there may be a correlation between late wet season conditions and higher recorded PFAS concentrations, however, data has not been collected

regularly across both wet and dry season conditions to determine if late wet and late dry season conditions are significantly different.

Based on data collected over the reported monitoring period, the conditions within the Katherine Township monitoring area remain similar to previous conditions.

Boxplots showing historical and current PFOS + PFHxS concentrations at off-base Katherine township areas are presented in **Figure 10**. For this analysis, <LOR values were replaced with LOR which represents a conservative assumption that <LOR values represent the maximum possible concentration (ANZG, 2018).

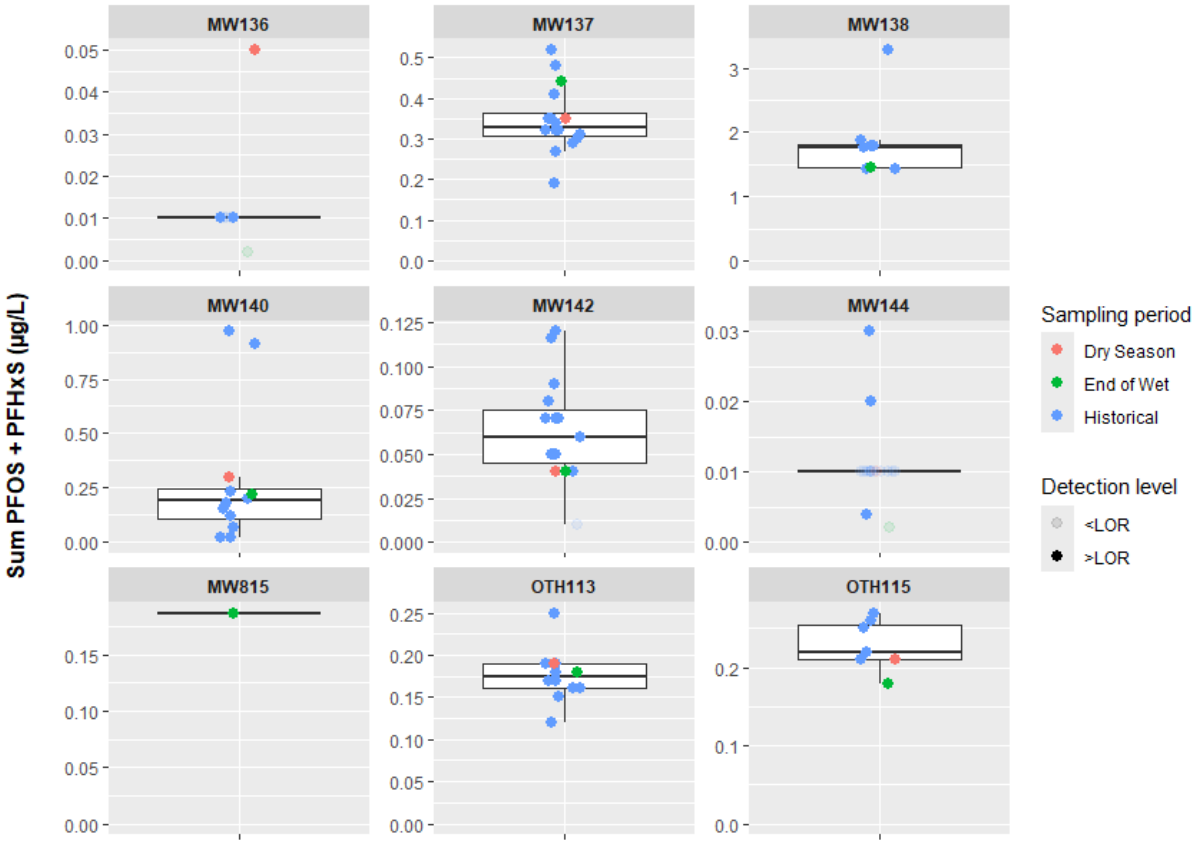

Figure 10 Boxplots showing historical and current PFOS + PFHxS concentrations at off-base Katherine township locations

Figure 10 indicates several samples as showing atypically low concentrations in the off-base Katherine township areas, and several as atypically high. Additional temporal and spatial data collections may be warranted to determine whether these potential shifts are statistically significant, and to resolve potential seasonal differences.

8.4.9 Off-base west Katherine River trend analysis

The off-base monitoring wells installed west of Katherine River are located within the leading edge of the plume of PFAS impacted groundwater. These locations consist of private properties and the Katherine Town Council extraction bores (prefix POT). For privacy reasons, descriptions of the specific locations of private property bores are not included in this section.

Historical concentrations of PFOA and PFOS+PFHxS reported in the off-base monitoring wells west of Katherine River are shown in **Graph G15**, **G16a**, **G16b** and **G16c** (**Appendix D**). Reported PFOS, PFOS+PFHxS and PFOA results are summarised in **Table 34** and presented in **Table T2** (**Appendix C**).

No discernible trends identifiable from temporal graphs **Graph G15** through **G16c (Appendix D**) with exception of monitoring locations OTH117, POT112, POT113, and POT129, which may be exhibiting increasing trends. Additional data will assist with determining trends in monitoring locations west of Katherine River.

Table 34 Groundwater summary results - Off-base west of Katherine River

Location ID	Analyte	Historical range[1] (µg/L)	OMP Events (OMR August 2024 - May 2025) (µg/L)

N/A = Not applicable; n/s = not sampled.

[1] Historical data range since monitoring commenced in 2017, prior to current OMR monitoring period.

Orange shading indicates one or more results above the historical range.

Utilising low-level analysis has resulted in a more complete understanding of the PFAS plume west of Katherine River, with specific focus on OMP sample locations within Cossack where multiple private water bore users exist. PFAS has been detected in locations where it was not previously detected using the standard analysis, and require ongoing assessment using low-level analysis. It is possible, and in some cases likely, that PFAS was present during previous sampling events, but not detected due to approach of the standard laboratory level analysis performed. The Cossack sampling program conducted under the OMP will be assessed with low-level analysis in future sampling events.

A review of temporal trend graphs **G15**, **G16a, G16b** and **G16c** (**Appendix D**) indicate there is a correlation between end of wet season conditions and higher recorded PFAS concentrations, with the highest concentrations considered to be associated with wet season conditions and low concentrations related to dry season conditions. Monitoring locations OTH117, OTH119, POT112, POT113, POT124, and POT129, in particular, show significant seasonal variance corresponding to recorded precipitation totals. Additionally, OTH117, POT112, POT113, and POT129 all appear to have increasing trends when reviewing PFAS concentrations recorded between 2017 and 2025.

Boxplots showing historical and current PFOS + PFHxS concentrations are presented in **Figure 11**.

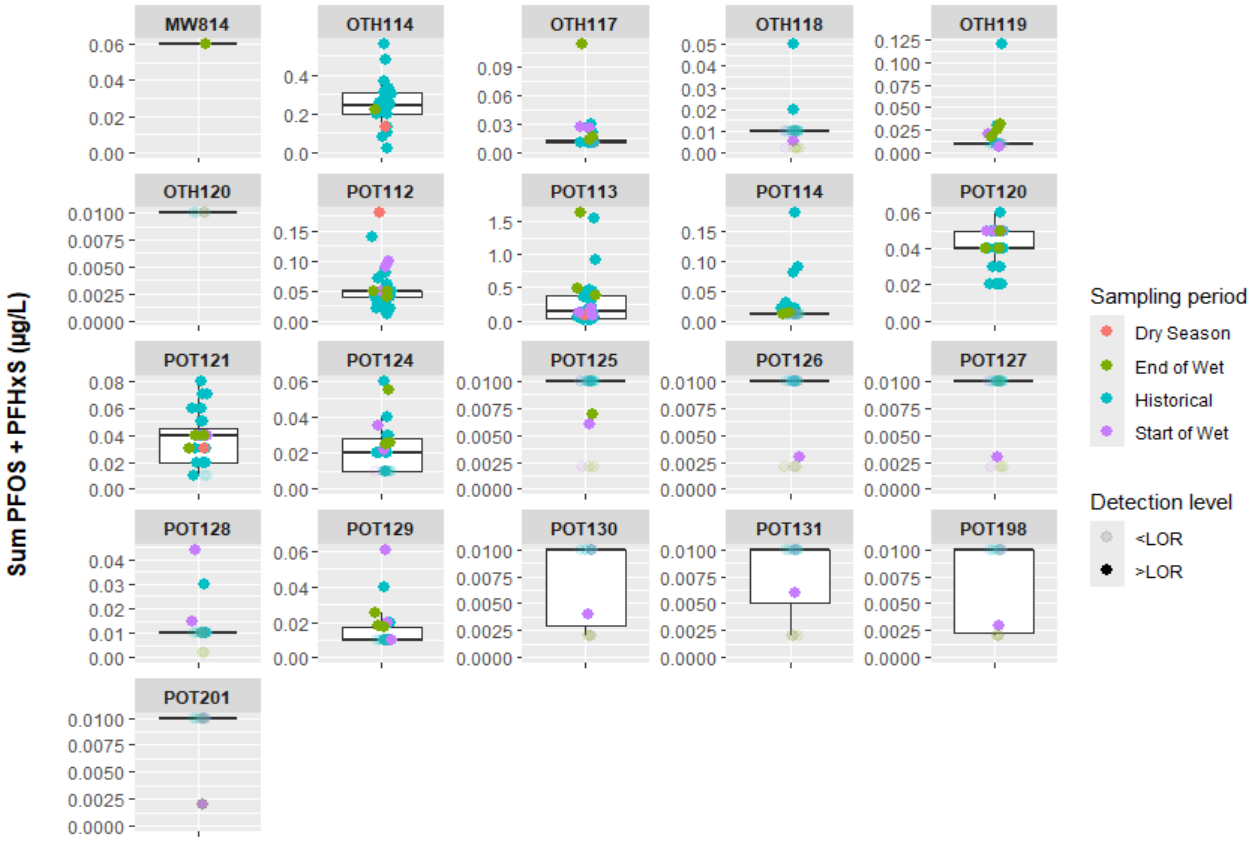

Figure 11 Boxplots showing historical and current PFOS + PFHxS concentrations at off-base west Katherine locations

Figure 11 indicates several samples as showing atypically low concentrations in the off-base west Katherine areas, and several as atypically high. Additional temporal and spatial data may be warranted to determine if these potential shifts are statistically significant, and to resolve potential seasonal differences.

8.5 Surface water results

8.5.1 Approach to surface water temporal trend analysis

The following sections detail results of surface water sampling which was carried out across two key drainage lines, Katherine River, and Tindal Creek. The Katherine Town Council Swimming Pool is part of the OMP (Defence, 2025a) scope for surface water sampling. However, the pool was closed for the duration of the sampling program for upgrades. Sampling will resume upon reopening of the pool and will be evaluated

for continued inclusion in the OMP (Defence, 2025a). The monitoring locations associated with each sampling area are presented in **Table 35**.

Table 35 Summary of surface water sampling locations area

Sampling location area	Location ID
Katherine River	SW100, SW108, SW110, SW151, SW153, SW161
Tindal Creek (on-base and off-base)	SW016, SW021, SW049, SW140, SW188, SW350
Katherine Town Council Swimming Pool	OTH008 (not sampled)

Temporal graphs for PFOA and PFOS+PFHxS concentrations in surface water are presented in **Appendix D** as summarised in **Table 36** below. The surface water temporal graphs only include locations which consistently report concentrations greater than the LOR for respective analytes. Where sample results were less than the LOR, a value at half the LOR was adopted for the graph.

Table 36 Summary of locations selected for surface water temporal plots

Sampling location area	Surface water monitoring IDs	Analyte	Graph ref
Katherine River	SW100, SW108, SW110, SW151, SW153, SW161	PFOS+PFHxS	**G17**
		PFOA	*No graph*[1]
Tindal Creek	SW016, SW021, SW049, SW140, SW188,	PFOA	**G18**
	SW016, SW021, SW049, SW140, SW188, SW350	PFOS+PFHxS	**G19**
Katherine Town Council Swimming Pool	OTH008	PFOS+PFHxS	**G20**
		PFOA	*No graph*[1]

[1] Temporal graphs for PFOA not presented due to results consistently reported below the laboratory LOR at all locations.

8.5.2 Katherine River trend analysis

Six surface water monitoring locations are positioned along the Katherine River and consist of areas used for recreation, areas of groundwater discharge as surface water, and ecological receptors. The locations are presented in **Table 35** above, historical concentrations of PFOS+PFHxS at surface water locations along Katherine River are shown graphically in **Graph G17** (**Appendix D**). PFOS, PFOS+PFHxS and PFOA results are summarised in **Table 37**. The complete data set has been presented as **Table T4** (**Appendix C**).

n/s – not sampled.

[1] historical data range since monitoring commenced in 2017, prior to current OMR monitoring period.

In periods with multiple sampling events, the maximum value for the period is presented.

Boxplots showing historical and current PFOS+PFHxS concentrations are presented in **Figure 12**.

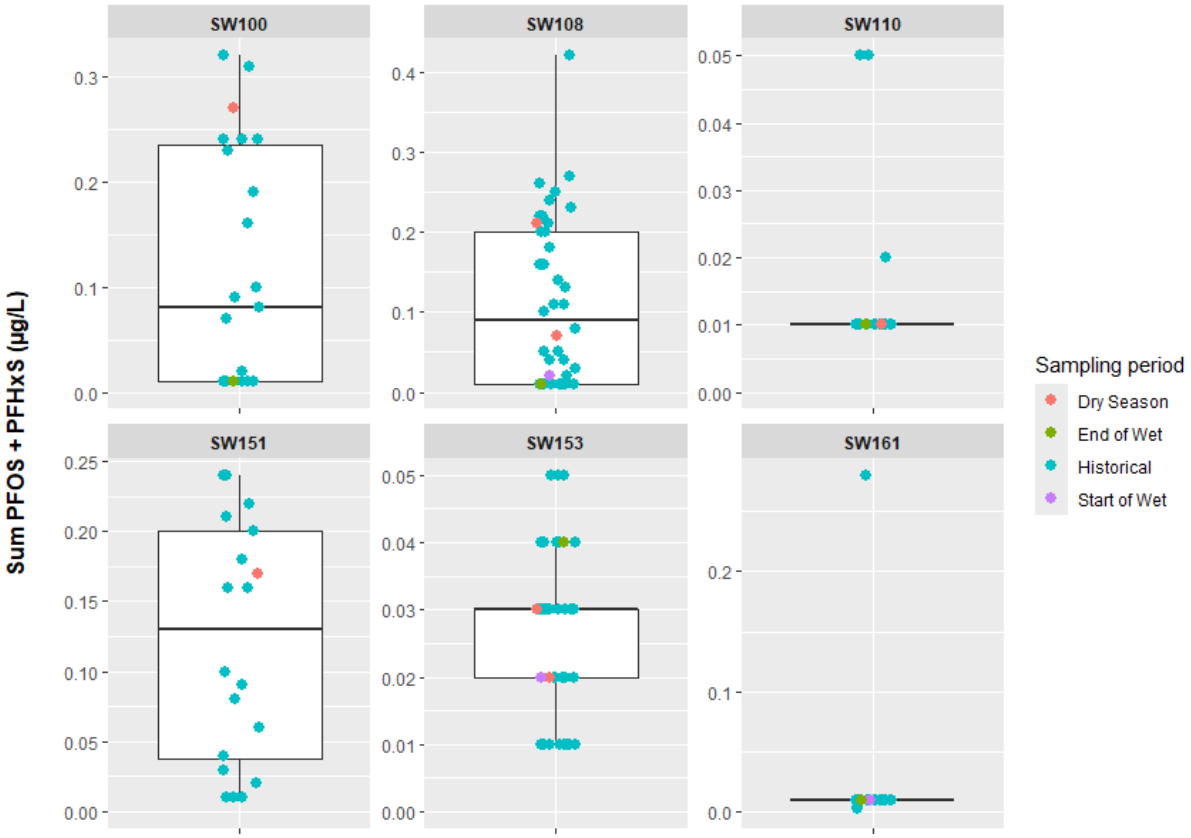

Figure 12 Boxplots showing historical and current PFOS + PFHxS concentrations at Katherine River locations

During the monitoring period, concentrations of PFOS, PFOS+PFHxS and PFOA were reported within historical ranges at all locations sampled in the Katherine River. PFOA concentrations were not reported above the laboratory LOR during the monitoring period in the Katherine River at any of the locations

sampled. PFOS and PFOS+PFHxS concentrations were not reported above the laboratory LOR during the end of wet season sampling event at all sampling locations with the exception of SW153.

Similar to conditions presented in the DSI (Coffey, 2018a), PFAS concentrations typically increase during the dry season when there is a higher percentage of contribution of groundwater to the Katherine River and decrease during the wet season conditions when dilution is a dominant factor, with more contribution from precipitation generated in upper catchment watershed. Observed PFAS concentrations in Katherine River remain similar to conditions reported during the historical investigative period.

8.5.3 Tindal Creek trend analysis

Tindal Creek is the main conduit for surface water transport of PFAS sourced from the base to Katherine River. Six surface water monitoring locations are positioned along Tindal Creek, SW016, SW021, SW049, SW140, SW188, and SW350. A total of 12 primary samples were collected from the four monitoring locations across the two monitoring events during the current monitoring period.

Historical concentrations of PFOA and PFOS+PFHxS at surface water locations along Tindal Creek are shown graphically in **Graph G18** and **G19** (**Appendix D**). PFOS, PFOS+PFHxS and PFOA results are summarised in **Table 38**, and presented in full in **Table T4** (**Appendix C**). PFOS+PFHxS results are also plotted in **Figure 13**.

Table 38 Surface water summary results - Tindal Creek

Location ID	Analyte	Historical Range[1] (µg/L)	OMP Events (OMR July 2024 - April 2025) (µg/L)	
		Min - Max	Start of wet season (November 2024 - January 2025)	End of wet season (February - April 2025)

n/s = not sampled.

[1] historical data range since monitoring commenced in 2017, prior to current OMR monitoring period.

Green shading indicates one or more results below the historical range.

In periods with multiple sampling events, the maximum value for the period is presented.

Boxplots showing historical and current PFOS + PFHxS concentrations are presented in **Figure 13**.

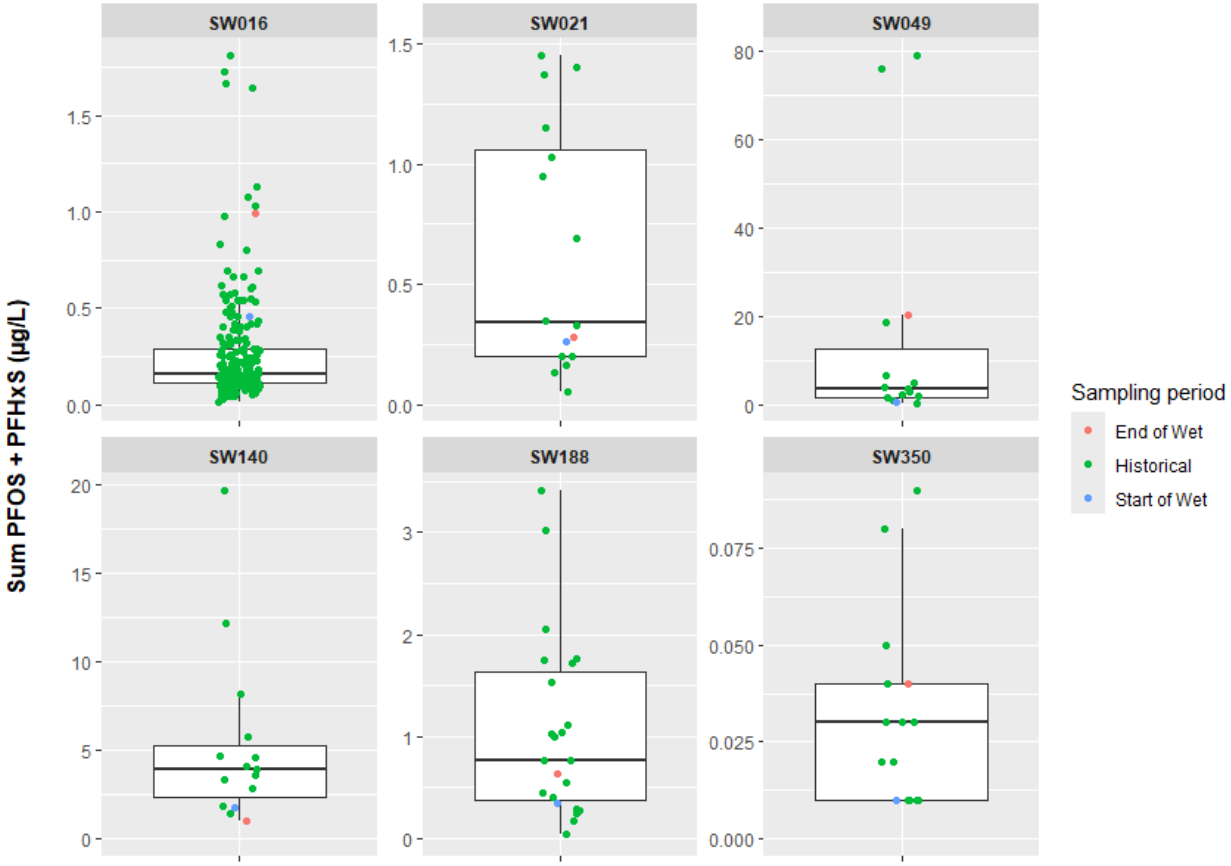

Figure 13 Boxplots showing historical and current PFOS + PFHxS concentrations at Tindal Creek locations

During the start of wet season sampling events, PFOS and PFOS+PFHxS were reported at concentrations less than historical ranges at SW049, located in the remediated FSA. Concentrations for PFOS and PFOS+PFHxS have decreased 0.52 µg/L and 0.48µg/L, respectively, when compared to the minimum historical range value. Concentrations increased between sampling rounds with concentrations of PFOS and PFOS+PFHxS increasing by an order of magnitude. It is noted that significant earth movement occurred in the vicinity of the FSA, including in the vicinity of surface water monitoring location SW049 where a significant increase in PFOS+PFHxS concentrations were recorded during the late wet season event. This concentration spike corresponded with results from other nearby and downgradient locations, which also reported higher concentrations than were recorded in the previous event. The exception being SW140, which monitors water flowing off the FSA hardstand area into the localised drainage system and is upgradient of SW049. Monitoring location SW140 reported PFOS, PFOS+PFHxS and PFOA concentrations below the historical ranges and has reported consecutive PFOS+PFHxS concentrations in all monitoring events since November 2023. As the projects associated to the nearby construction works have been completed and the area replanted, it is expected that concentrations will gradually decrease with time.

Collection of samples during the early wet season sampling event occurred after the first significant rainfall event of the wet season.

Monitoring location SW016 has recorded concentrations below the historical average since 2021. Concentrations of high mobility short chain PFAS compounds such as PFBS and Perfluoropentanoic acid (PFPeA) were detected (0.08 µg/L and 0.03 µg/L respectively), during the April 2025 sampling event. Additionally, Perfluoropentane sulfonic acid (PFPeS) and Perfluoroheptane sulfonic acid (PFHpS) have reported concentrations of 0.07 µg/L and 0.03 µg/L respectively during the April 2025 sampling event. Short chain PFAS compound Perfluoroheptanoic acid (PFHpA) has not been reported at monitoring location SW016 since April 2021.

Although the rehabilitation efforts were completed at the FTA and FSA, carbon-based materials can prefer adsorption of long-chain PFAS compounds such as PFOS and PFOA, over short-chain PFAS compounds like PFPeA and PFBS. This results in the short-chain PFAS compounds being more mobile and contacting surface water through shallow groundwater moving upward or laterally in the soil that discharges into surface water bodies.

It is noted that soil remediation works completed at the FSA and FTA are anticipated to result in consequential improvements of PFAS concentrations within surface water within Tindal Creek after a period of time.

8.5.4 Katherine Town Council swimming pool trend analysis

Monitoring location OTH008 / Katherine Town Council Swimming Pool was not conducted during the reporting period as it has been shut for repairs. Sampling of the pool will recommence once work is complete and the pool reopens to the public.

Historical concentrations of PFOS+PFHxS within the Katherine Council Swimming Pool are shown graphically in **Graph G20** (**Appendix D**). Historical PFOS+PFHxS and PFOA results are presented in **Table T4** in **Appendix C**.

8.6 Aquatic biota

Aquatic biota monitoring within Katherine River is conducted annually at the end of the dry season to monitor changes in PFAS concentrations over time and confirm ongoing relevance of data used to inform NT Health advice to the community.

Aquatic biota sampling was undertaken for analysis of specific fin-fish species, as summarised in **Table 39**, which included some targeted 'indicator' species, and where available, the collection of other relevant 'opportunistic' fin-fish. Crustaceans (cherabin) were also collected where available. Other species of fin-fish not listed in **Table 39** were not collected and returned upon catch.

Table 39 Bioaccumulation biota groups

Bio-accumulation species group	Indicator / target species	Relevant opportunistic catch
Low	Barramundi	Sleepy cod Sooty grunter
Moderate	Bony Bream	Black or blue catfish Butlers grunter Barred grunter
High	Mullet	Planiliza ordensis

The analytical data for the current monitoring period, as well as the historic biota sampling results, are included as **Table T5** in **Appendix C**. These tables present the aquatic biota concentrations gathered since 2017 and have been collected from biota sampling locations BIO078 and BIO088, which are located on the Katherine River within the vicinity of monitoring locations SW108 and SW151, respectively. Monitoring activities are summarised in the 2024 Dry Season SER (AECOM, 2025b) which is included in **Appendix B**.

Historic ranges have been based on the species groups presented in **Table 39** above. An assessment of the PFAS results from the current monitoring period against historic ranges has been completed in **Table 40** below.

Table 40 Analytical results for PFOS+PFHxS, PFOS and PFOA in aquatic biota samples

Group	Analyte	Historic range[1] (µg/L)		OMP Event (October 2024) (µg/L)		
		Min	Max	Min	Max	Average
Low bio-accumulation species	PFOS+PFHxS	0.004	1.406	0.011	0.032	0.018
	PFOS	0.0003	1.40	0.011	0.032	0.018

Group	Analyte	Historic range[1] (µg/L)		OMP Event (October 2024) (µg/L)		
		Min	Max	Min	Max	Average
	PFOA	0.0006	0.0007	<0.001	<0.001	<0.001
Moderate bio-accumulation species	PFOS+PFHxS	0.002	0.3214	0.004	0.096	0.039
	PFOS	0.002	0.32	0.004	0.094	0.038
	PFOA	ND	ND	<0.001	<0.001	<0.001
High bio-accumulation species	PFOS+PFHxS	0.001	0.7727	0.081	0.103	0.089
	PFOS	0.001	0.77	0.081	0.103	0.089
	PFOA	ND	ND	<0.001	<0.001	<0.001
Crustaceans (Cherabin)	PFOS+PFHxS	0.001	0.094	0.011	0.025	0.017
	PFOS	0.001	0.091	0.011	0.041	0.020
	PFOA	ND	ND	<0.001	<0.001	<0.001

Concentrations which exceed relevant action criteria are filled yellow.

[1] historical data range since monitoring commenced in 2017, prior to current OMR monitoring period.

ND = not determined, all results below LOR.

Fish tissue PFOS+PFHxS concentration data are also plotted as a product of sample date in **Figure 14**. For this analysis, <LOR values were replaced with LOR which represents a conservative assumption that <LOR values represent the maximum possible concentration (ANZG, 2018).

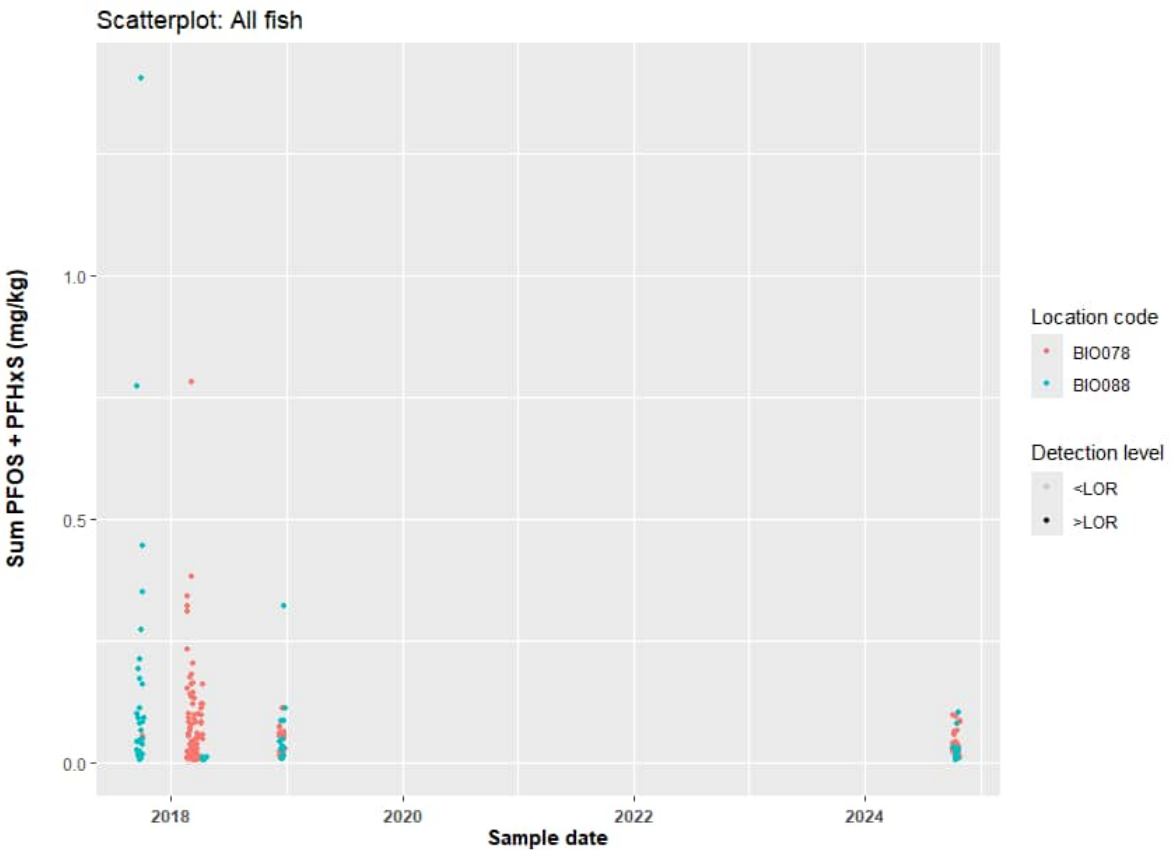

Figure 14 Scatterplot of fish (all species) tissue PFOS + PFHxS concentration data as a product of sample date

The concentrations reported from all species groups were within the historical range for PFAS during the monitoring period. From the data it is observed that maximum concentrations detected for low, moderate and high bioaccumulation species exceeded relevant consumption criteria (FSANZ, 2017) for PFOS and PFOS+PFHxS, whilst the average high bio-accumulation species result also exceeded the relevant consumption criteria (FSANZ, 2017) for PFOS and PFOS+PFHxS.

Concentrations of PFOS+PFHxS and PFOS were detected across all samples collected during the monitoring period, while PFOA did not exceed the LOR in any samples. **Figure 14** indicates a potential decrease in fish PFOS+PFHxS tissue concentrations over time, with random horizontal ‘jitter’ applied to the datapoints for visualisation purposes.

In crustaceans, concentrations of PFOS+PFHxS reported below the relevant consumption criteria (FSANZ, 2017) for both sample locations. Both results were within an order of magnitude of the historical PFAS concentration range.

The risks associated with consuming aquatic biota remain similar to conditions described in the Human Health Risk Assessment (HHRA) (Coffey, 2018c). Sampling of aquatic biota is conducted primarily to support NT Health to maintain the relevance of health advisories. The bioaccumulation of PFAS in aquatic biota will continue to be monitored through the OMP.

9.0 Discussion

9.1 Conceptual site model (CSM)

An initial CSM was developed during the investigation and human health risk assessment stages of the program (Coffey, 2018a; Coffey, 2018b; Coffey, 2018c), and summarised in the OMP (Defence, 2025a). The CSM summarises the linkages between sources, exposure pathways and receptors. Data obtained during the current monitoring period has been used to update and refine the initial CSM to incorporate any observable PFAS concentrations trends in groundwater and surface water on- and off-base. The revised drinking water guideline values (NHMRC, 2025) have required a review of the current understanding of risk associated with the CSM, which are discussed below.

Update and refinement of the CSM comprises:

- Source mass discharge reduction at the FTA and FSA due to the recent completion of soil remediation. It is anticipated that consequential improvements in surface water and groundwater will transpire in the medium to long-term (i.e. reduced mass discharge from the source areas).
- Seasonal influence on the extent and magnitude of PFAS mass in groundwater on- and off-base. The soil remedial activities at the FTA and FSA (PFAS mass removal, adding PAC to the remaining soil to increase its PFAS adsorption capacity, and capping of the treated soil) have reduced the potential for PFAS to migrate (i) from the dry season vadose zone to groundwater when the water table rises during the wet season and (ii) to surface water via rainfall runoff.
- Receptor exposure: On base exposure to PFAS via physical contact with soil has been reduced due to the completion of soil remediation at both FSA and FTA.
- Receptor exposure: Encroachment of the PFAS plume, at concentrations that intermittently exceed drinking water criteria, but now exceed the revised drinking water criteria, within the Cossack and potentially nearby in areas further south (both west and east of Katherine River). These areas are currently designated Management Zone 5.
- Receptor exposure: Encroachment of the PFAS plume, at concentrations that exceed drinking water criteria, to the north of the currently identified plume extent. Identified in the first-time detections at northern sentinel well MW814 and MW815. This area has previously been designated as Management Zone 5. As such revision of receptor exposure, via drinking of groundwater, is warranted.

While the CSM described in the DSI (Coffey, 2018a) adequately describes the sources, pathways and receptors within the Management Area, it is identified that an expansion of the PFAS plume to the west and north of the Management Area may be occurring.

New historical maximums have been detected off-base within this monitoring period, though typically within the same order of magnitude. These increases are likely the result of seasonal variations and likely not representative of an overall increasing trend, which is to be monitored through the ongoing sampling events under the OMP. Additionally, low-level PFAS testing for select locations along the monitored PFAS plume edge have contributed to the increase of new locations reported with PFAS detections.

Reported PFAS concentrations in groundwater at the two primary source areas (FTA and FSA) have fluctuated seasonally and likely as a result of the remedial works at these sites. Results from the OMP (Defence, 2025a) program has thus far been inconclusive, however, some locations closest to the remediation area have reported PFAS concentrations below the historical average since September 2023.

PFAS concentrations in surface water locations both on- and off-base remain relatively stable, however, recorded PFAS concentrations at the base boundary at SW016 have been, and continue to be, below the historical average since 2021, with corresponding concentrations of high mobility short chain PFAS compounds reporting below the LOR since 2021. A recent increase in PFAS concentrations was observed in on-base drainages and within Tindal Creek during the 2025 late wet season sampling event, which may be a result of recent earthworks activities that have exposed soils between the FSA and the runway area. Despite this observed increase, PFAS concentrations recorded at SW016 at the base boundary remain below the historical average. There has also been a notable decrease in PFAS concentrations recorded at SW140, which receives water from the FSA hardstand area, which is a known source of PFAS in surface water on-

base. Ongoing monitoring of PFAS within Tindal Creek will determine the effectiveness of soil remediation works at the FSA and FTA result, if a continued decrease is reported over time.

Within the Katherine River, concentrations were reported below the recreational criteria during the monitoring period. A strong seasonal trend has been observed with PFAS concentrations typically lower during the wet season due to stormwater contributing more to river flow. The location, known as Donkey Camp (SW161), where water is extracted from Katherine River to supply the local town water supply remains below the drinking water criteria.

The HHRA (Coffey, 2018c) identified specific Management Zones within the PFAS Management Area, intended to distinguish between water uses, and further characterised by PFAS concentrations. With the adoption of the revised drinking water guideline values (NHMRC, 2025), the Management Zones no longer reflect the potential risk exposure to receptors of drinking water, particularly to receptors in Zone 2, which are presented in **Figure F1** (**Appendix A**) and summarised in **Section 2.2**.

9.2 Risk profile

9.2.1 Risk assessment summary

The HHRA (Coffey, 2018c) and the Ecological Risk Assessment (ERA) (Coffey, 2018d) assessed the potential on- and off-base human health and environmental risks resulting from exposure to base-derived PFAS in soil, groundwater and / or surface water.

9.2.2 Human health risk assessment

The exposure pathways where potential risks were identified as elevated in the HHRA (Coffey, 2018c) included:

- Consumers of PFAS impacted groundwater or river water as a primary drinking water source
- Consumers of home-grown produce (eggs and meat) irrigated using PFAS impacted groundwater
- Consumption of aquatic biota captured from the Tindal Creek or Katherine River (downstream of Knotts Crossing)
- Base construction or maintenance workers with direct contact to PFAS impacted soil and effluent.

The current data set collected under the OMP does not indicate that there is a change in the identified HHRA exposure pathways described above with exception to the soil remediated areas at the FSA and FTA, where exposure to construction and maintenance works is reduced.

While the overall mechanism of PFAS transport from on-base source areas to downgradient receptors has not changed since the development of the HHRA (Coffey, 2018c) and ERA (Coffey, 2018d), it is expected that soil remediation that has occurred at the FSA and FTA will reduce PFAS discharge from the base, subsequently reducing risk downgradient. Conversely, the adoption of revised drinking water guideline values (NHMRC, 2025) and use of low-level laboratory analysis has identified additional areas, particularly in Cossack, where risks are potentially increased. Perceived risks in downgradient locations are a result of lower guideline values that capture additional area at lower concentrations than what was previously considered in the original risk HHRA (Coffey, 2018c), not the result of additional PFAS in the area or expansion of the PFAS plume.

9.2.3 Ecological risk assessment

The exposure pathways where potential risks were identified as elevated in the ERA (Coffey, 2018c) included:

- Aquatic invertebrates, amphibians and fish in PFAS impacted water. Plants in direct contact with soils
- Birds and mammals that eat fish from Tindal Creek
- Birds and mammals that eat plants, invertebrates and reptiles.

The current data set collected under the OMP does not indicate that there is a change in the identified ERA exposure pathways described above.

9.2.4 Risk profile evaluation

The key findings of the HHRA and ERA are supported by the data collected as part of the OMP over the monitoring period. However, there have been some changes observed in PFAS concentrations in groundwater and surface water within and outside the Management Area. These changes are attributed to increased data collection revealing seasonal fluctuations, potential western and northern migration of PFAS in groundwater, and the effects of soil remediation in the two key source areas (FSA and FTA).

Exposure point concentrations relevant to human and ecological receptors have been directly assessed through the DSI (Coffey, 2018a) and key community exposure points continue to be monitored, including:

- The Katherine Town Council Swimming Pool (OTH008), which has remained less than the recreational guidance values since 2018
  - It is noted the swimming pool is currently being renovated and PFAS conditions within the swimming pool water may change depending on the nature of the renovations and if localised bore water is used as the pool's water source
- The Katherine Hot Springs (SW153), which has remained less than the recreational guidance values since 2018
- Aquatic biota (fish and cherabin) in Katherine River, which was identified as a potential exposure risk in the HHRA (Coffey, 2018c) and continues to be monitored for changes in risk level
- Groundwater bores in Cossack on the western side of Katherine River, close to the river, where concentrations exceed the adopted drinking water criteria.

Preliminary risk profile assessments are provided for groundwater, surface water, aquatic biota, and the ecosystem within the Management Area in the sub-sections below.

9.2.4.1 Groundwater

Groundwater concentrations east of the Katherine River are consistent with the risk profile as developed in the HHRA (Coffey, 2018c), which related to unacceptable exposure to concentrations consistently above the drinking water criteria.

To the west of the Katherine River, instances have been identified where PFAS concentrations in individual wells have reported first time concentrations above the drinking water criteria, as well as first-time detects using the low-level analysis, with PFAS impacts within groundwater possibly migrating west of the extent of the current Management Area. It is recognised that:

- New detections reported for PFOS+PFHxS are the result of fluctuations in concentrations but within historical ranges or note to require ongoing monitoring to assess for potential trends
- Monitoring locations OTH117, POT112, POT113, POT124, POT128 and POT129 reported new maximum concentrations of PFOS+PFHxS during the reporting period, suggesting PFAS groundwater encroachment in Cossack may be seasonally driven
- New exceedances of the drinking water criteria were reported for OTH117 and POT128 during the February Private Bore sampling event
- First-time detections of PFOS+PFHxS were reported for POT125, POT126, POT127, POT130, POT131, POT198 and POT201 during the February Private Bore sampling event.

With adoption of the revised ADWG and low-level PFAS testing conducted west of the Katherine River, it is identified that the risk profile in Cossack is changing, ongoing monitoring under the OMP will continue to monitor and assess the risk profile, and that the current understanding of the risk profile does not align with the current Management Area description. Defence maintains a precautionary approach to support the community with programs to provide alterative water supplies to those impacted.

9.2.4.2 Surface water

Despite fluctuations of PFAS reported in surface water, concentrations are similar to previous monitoring for locations at Katherine River and the Katherine Hot Springs, likely due to ongoing PFAS contributions from groundwater. Remediation efforts are not expected to have a substantial change near Katherine River for several years, however sampling data recorded in Tindal Creek (SW016) suggest that PFAS leaving the base via surface water has reduced as a result of soil remediation works completed at the FTA and FSA.

All surface water locations were reported below the recreational water criteria during the monitoring events completed in the monitoring period with exception to monitoring location SW049, which is within the drainage system where civil works were occurring between the FSA and the runway area. As concentrations downgradient at SW016 showed no significant change from the historical concentration range, there is no apparent change to the risk profile associated with PFAS concentrations present in surface water within the Management Area.

9.2.4.3 Aquatic biota

PFAS concentrations in aquatic biota from the Katherine River were similar to previous results, with a stable to decreasing trend observed over the sampling events for high to low-bioaccumulating species groups (refer **Section 8.6**). Based on consistency of the recent OMP results with historical concentrations, there is no apparent change to the risk profile associated with PFAS concentrations present in aquatic biota.

9.2.4.4 Ecological risks

The conditions described within the ERA (Coffey, 2018d) remain accurate and the risks to organisms within the Management Area ecosystems remain unchanged at this time.

9.3 Assessment of current OMP

Based on the above review of the data collected during the monitoring period, there are no significant changes to the understanding of the nature, extent or risks associated with PFAS at the base or within the Management Area except for the following:

- Changes in plume, concentrations, and potential risk within Cossack
- Incomplete understanding of plume extent and potential risks along the northern plume boundary east of Katherine River.

The need for monitoring of additional media has not been identified at this time. It is also understood that no significant OMP updates are required arising from stakeholder engagement or changes in land use.

Based on an evaluation of the data presented in this report the following OMP (Defence, 2025a) triggers were met:

- Locations POT112, POT113, POT121, OTH117, OTH119 had concentrations above the drinking water criteria during one or more monitoring event during the monitoring year within Management Zone 5 (PFOS+PFHxS concentrations below 7 µg/L)
- New exceedances of the drinking water criteria at POT121 and OTH119
- PFAS detected in sentinel wells MW815 and MW136.

As a result of these specific triggers, and adoption of the revised ADWG for applicable drinking water receptors, a review of the OMP is required. The OMP (Defence, 2025a) indicates that if additional properties report detectable concentrations of PFAS, the monitoring network should be expanded as required to characterise the risk from PFAS plume in the area. Additionally, the OMP requires review to adequately address the revised ADWG (NHMRC, 2025) with lower concentration limits and the use of low-level laboratory PFAS testing for ongoing monitoring that risks are being adequately managed.

Testing was performed at additional groundwater monitoring wells within the Cossack area during the wet season in 2024-2025 to determine if there is a change in risk outside the current Management Area, within Cossack. It is noted that 4 of 6 groundwater monitoring wells in February 2025 and 3 of 6 locations in March 2025 were reported above the revised ADWG, and requires update in the OMP.

In addition, the suitability of the monitoring well network along the northern boundary of the Management Area, in particular north of MW815, is being evaluated to determine if additional monitoring locations should be included to delineate the plume.

10.0 Conclusion

Overview of CSM

The monitoring conducted over the current period is considered to have met the objectives of the SAQP and the overall OMP (Defence, 2021b). The CSM was reviewed in light of monitoring data collected during the reporting period (June 2024 - May 2025). Updates to the CSM are required to reflect changes in previously identified sources, pathways, and/or receptors at the base or within the Management Area, as described in the PMAP (Defence, 2025b) The findings of the interpretive analysis conducted for the monitoring period are considered consistent with the risk profile for the Management Area. In summary, CSM changes were identified including, but not limited to:

- Westerly migration and potential expansion of PFAS groundwater plume, particularly during and immediately following wet seasons.
- Increased potential receptor exposure in areas not previously observed in Cossack and along the northern plume boundary.
- Reductions in PFAS concentrations have been observed at the base boundary within Tindal Creek, corresponding with soil remediation actions at the FSA and FTA.
- Reductions in risk to on-base construction and maintenance workers at the FSA and FTA resulting from soil remediation and site controls.
- The northern plume monitoring network may not completely capture the northern plume boundary. Additional monitoring locations included in a revised OMP would improve northern plume boundary tracking within the Management Area.
- Adoption of the revised drinking water guideline values (NHMRC, 2025) has expanded the relevant plume boundary to the west, potentially changing the risk at additional properties within Cossack.

Groundwater analysis

Limited seasonal data collected over the monitoring period indicated that the PFAS groundwater plume is most likely seasonally influenced. Down-gradient locations report higher PFAS concentrations during the wet season within the leading edge of the plume within Cossack.

- PFAS-impacted groundwater perennially discharges into Katherine River. The concentrations of PFAS recorded within the Katherine River during the dry season were higher than during wet season, when surface water runoff is a greater contributor to river flow.
- The FSA and FTA have both undergone or are undergoing remediation works (soils / infrastructure). Due to the apparent seasonal variation in PFAS concentrations, further monitoring is required to determine the influence of the works in reducing surface water and groundwater concentrations at, and downgradient of the key source areas.

Significant improvements to groundwater conditions downgradient of the on-base source areas, as a result of the operation of two WTPs, have not been clearly observed to date. New extraction wellfields are being developed for potential use and optimisation of the existing WTPs.

Surface water analysis

- No changes in PFAS conditions have been observed in the Katherine River or Katherine Hot Springs over the monitoring period.
- Concentrations of PFAS in Tindal Creek, while slightly higher than the previous reporting period, still remain below the historical average.

Aquatic biota analysis

- Monitoring results from collected aquatic biota during the monitoring period remains similar to conditions recorded during the investigation stages. Further monitoring will continue to support NT Health to maintain consumption of aquatic biota advisory notices up to date / current.

1.0 Introduction

1.1 Preamble

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) in January 2022 to implement the per- and poly-fluoroalkyl substances (PFAS) Management Action Plan (PMAP) (Defence, 2019a), for Royal Australian Air Force (RAAF) Base Tindal ('the base'). Collectively the PMAP implementation comprises a number of services which will collectively be referred to as the 'project' hereafter.

The location of the base with respect the nearby township of Katherine, Northern Territory (NT) is shown on **Figure F1 (Appendix A).**

The key objectives of the project (in its entirety) are to:

- Implement practicable solutions to prevent or minimise the migration of PFAS beyond the Defence property boundary by addressing significant source area/pathways on the base
- Ensure the proposed and implemented remedial strategies have measurable and demonstratable results.

The project has been split into five Service Packages, with Service Package 4 (Ongoing Monitoring Plan [OMP] Services) being relevant to this Dry Season 2024 Sampling Event Report (SER). Wet season sampling is also undertaken under this Service Package, although the data and outcomes are reported separately.

The primary purpose of the OMP (comprising both dry and wet season sampling) is to monitor changes to the PFAS impact in groundwater and surface water pathways associated with the key sources of PFAS on base, as initially identified and assessed through the detailed site investigation (DSI) phase of works (Coffey, 2018a) (Coffey, 2018b). Changes in PFAS impact may result from the base-specific or cumulative influence of remediation or containment actions, transportation trends, and / or changes to hydrogeology or climatic conditions. Identified changes to PFAS impact originating from the base can inform risk management decisions taken by Defence and Territory agencies to protect human health and the environment. At the end of 2025, an ongoing monitoring report is to be prepared that assesses the complete data set collected during the discrete monitoring events completed over the 12-month period. This annual assessment will consider environmental variability and statistically significant trends in PFAS concentrations.

The seasonal monitoring program at the base includes a regime of groundwater, surface water and biota sampling to evaluate these changes in the long term, to enable Defence to maintain an up-to-date understanding of temporal and spatial distribution, concentration, and transport of PFAS. The data collection requirements which were adopted for the project are documented in the Sampling Analysis and Quality Plan (SAQP) Revision 6 (AECOM, 2023)**.**

The most recent PFAS OMP approved in October 2021 (Defence, 2021a)**,** outlines the requirement to conduct biota sampling (once per year), groundwater sampling for private bores (monthly during the wet season and once during the dry season), annual or biannual monitoring of other groundwater locations on- and off-base, and quarterly surface water sampling (up to four times a year) also on- and off-base, as presented in **Table 1** below.

Table 1 OMP sampling schedule with dry season sampling highlighted in yellow.

Sampling	Wet Season						Dry Season					
	Early		Mid		Late		Early		Mid		Late	
	Nov-23	Dec-23	Jan-24	Feb-24	Mar-24	Apr-24	May-24	Jun-24	Jul-24	Aug-24	Sep-24	Oct-24
Ground-water	Monthly in Wet	Monthly in Wet	Monthly in Wet	Monthly in Wet	Monthly in Wet	Monthly in Wet						Once in Dry
												Annual
					Biannual						Biannual	
Surface Water	Quarterly		Quarterly			Quarterly			Quarterly			Quarterly
											Annual	
					Biannual						Biannual	
	Twice in Wet				Twice in Wet							
Aquatic Biota											Annual	

1.2 Objective

The purpose of this SER is to summarise the scope of works and findings from the dry season sampling works conducted between May 2024 through to October 2024 in accordance with the SAQP (AECOM, 2023). This report has been prepared in accordance with the Defence's PFAS OMP Reporting Guidance, (Defence, 2024).

An annual ongoing monitoring report (OMR) will be subsequently developed for the purpose of assessing the data collected during May 2024 through April 2025.

2.0 Scope of Works

2.1 Overarching Scope

The groundwater, surface water and biota sampling works described herein were completed in general accordance with the SAQP (AECOM, 2023), where deviations arose, these are listed with the significance of the consequence described in **Section 2.3** below. Prior to sampling, the SAQP was reviewed to ensure compliance with the following:

- the OMP (Defence, 2021a)
- Heads of the Environment Protection Authority (HEPA), PFAS National Environmental Management Plan (NEMP 3.0) (HEPA, 2025)
- National Environment Protection (Assessment of Site Contamination) Measure 1999 as amended 2013 (ASC NEPM, 2013)
- Defence Routine Environment Water Quality Monitoring Manual (Defence, 2019b)
- Australian/New Zealand Standard (AS/NZ) 5667:1998 Water quality – Sampling (AS/NZS, 1998)
- Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2018)**.**

The planned scope of works for the dry season 2024 monitoring period that is outlined in the SAQP (AECOM, 2023) includes:

- Collection of 27 annual groundwater samples in October 2024 from on- and off-base locations.
- Collection of three biannual groundwater samples in September or October 2024 from off-base locations.
- Collection of 18 ‘once in dry season’ groundwater samples in October 2024 from off-base private property locations.
- Collection of a biota samples from two sampling areas along Katherine River in September or October 2024.
- Collection of three biannual surface water samples in October 2024 from off-base locations.
- Collection of three quarterly surface water samples in October 2024 from off-base locations.
- Collection of one annual surface water sample in October 2024 from an off-base location.
- Collection of relevant quality assurance and quality control (QA/QC) samples as per the SAQP (AECOM, 2023)
- Analysis of samples included the 28 analyte PFAS-suite (full suite) at the standard limit of reporting (LOR)
- Data management of the OMP field and laboratory data in the Defence ESdat database in accordance with Defence’s Contamination Management Manual (DCMM) (Defence, 2021b) Annex L requirements.
- Preparation of this Dry Season 2024 SER.

2.2 Monitoring Locations

The monitoring locations outlined within the SAQP (AECOM, 2023) for the dry season sampling events are tabulated below. Deviations from the planned sampling are highlighted in **bold** and detailed in **Section 2.3** below.

Table 2 Quarterly surface water sampling locations – June and October 2024 (Figure F2 through to F5 in **Appendix A)**

Area	Description	SAQP Locations
Off-base	Katherine River	SW108, SW153,

Area	Description	SAQP Locations

Area	Description	SAQP Locations
Off-base	Katherine River	Galloping Jacks (BIO078) and Down Stream Stuart Highway (BIO088)

2.3 Deviations from the SAQP

The biannual, annual and quarterly surface water events included some deviations from the SAQP (AECOM, 2023) as outlined in **Table 9.**

Table 9 Surface water deviations from the SAQP during the October - December 2024 sampling event

SAQP	Deviation	Impact on OMP
Collection of water quality parameters from surface water sampling locations	Water quality parameters were not collected at SW151, which is collected during the aquatic biota sampling event.	Minor impact – a review of historical water quality parameter data indicated that there is minimal variance in parameter readings across the four Katherine River sampling locations, therefore collection from the other three locations should provide sufficient data for interpretive purposes.
Collection of three quarterly surface water samples	OTH008 - the local public swimming pool, was unable to be accessed due to the facility being closed for renovations.	No impact to the program as sample collection from OTH008 monitors for potential health risks from PFAS within the swimming pool, therefore there are no risks to the public while the pool is not in operation.

The annual and biannual groundwater events included deviations from the SAQP (AECOM, 2023) as outlined in **Table 10** below.

Table 10 Groundwater deviations from the SAQP during the October - December 2024 sampling events

SAQP	Deviation	Impact on OMP
Gauging and sample collection of 28 annual groundwater locations	23 annual groundwater locations were sampled. Five annual groundwater locations (or their SAQP listed alternative) were not able to be sampled: • MW117 presented as dry and it's SAQP listed alternative, MW118, was also dry • MW134 could not be sampled due to root blockage • MW138 could not be sampled due to root blockage • MW235 was not able to be sampled as it was decommissioned prior to soil remediation works commencing at the former FTA. The SAQP does not list a suitable alternative well and recommends replacing well if not able to be sampled. • POT119, AECOM have not been able to obtain a signed access letter from the owner since April 2021. A new groundwater monitoring well has been installed in November 2024 to substitute data historically collected from POT119.	MW117 – Potential data gap for concentrations of PFAS on the western boundary track. MW130 (long screened interval like MW117) to the north was able to be sampled, reducing the impact of this data gap (2 km spatial data gap). MW117 and MW130 overlap in screen intervals from 1 to 14.5 metres below ground level (m bgl).
		MW134 – Potential data gap for concentrations of PFAS north-west of the plume. MW135 (long screened interval like MW134) to the north was able to be sampled, reducing the impact of this data gap. MW134 and MW135 are screened the same from 2.5 to 19 m bgl. This well has been subsequently repaired with sampling to resume at this location during the 2025 end of wet season monitoring event.
		MW138 – Potential data gap for concentrations of PFAS centre of the plume. However, MW137 (long screened interval like MW138) to the north was able to be sampled, reducing the impact of this data gap. MW138 and MW137 are screened the same from 2 to 18 m bgl. This well has been subsequently repaired with sampling to resume at this location during the 2025 end of wet season monitoring event.
		MW235 – minimal data gap. MW235 has been decommissioned and is recommended to be removed from the OMP due to the location being within the PMAP Soil RAP remediated area and drilling a new well may compromise the cap. Current focus at the FTA is groundwater remediation through a pump and treat system and monitoring PFAS discharge through groundwater from the FTA source area. Installation of additional monitoring wells is currently under review.

SAQP	Deviation	Impact on OMP
		Significant data gap - POT119 is a sentinel well along the northern in northern boundary of the plume, along Gorge Rd where PFAS have been below the LOR. A replacement monitoring well (MW815) has been installed near this sampling location on public land to address this data gap, however, the new well was not installed prior to this sampling event. The newly installed well will be sampled during the next event in February-March 2025. It is recommended to add as a replacement location for POT119 in the next revision of the SAQP and OMP.
Alternative location sampled for one annual groundwater locations.	MW734 was impacted by roots and unable to be sampled. It's SAQP prescribed alternative (MW132) was also impacted by roots and unable to be sampled. Nearby location MW133 was sampled as an alternative.	MW734 – Minimal data gap as MW133 (long screened interval like MW734) was able to be sampled instead to monitor the concentrations of PFAS on the western base boundary. MW734 and MW133 overlap in screened intervals from 3.2 to 19.7 m bgl. MW734 continues to be screened to 80.9 m bgl. However, as PFAS tends to concentrate within the vadose zone, results from MW133 can be used to minimise the data gap from not sampling MW734. The intent of this cross-gradient well is to capture the northern plume boundary along the northern base boundary to ensure that concentrations remain low and risk to the community to north remain low.
Additional 19 groundwater locations gauged and/or sampled	MW136 is a groundwater monitoring well that is to be added to the upcoming OMP revision and therefore was included as part of the October-December 2024 monitoring event.	Additional data point - MW136 is located between the northern plume edge and nearby private bore users. Sampling from this location as part of the OMP will increase the resolution of the sentinel well network in tracking PFAS migration that could potentially impact nearby private bore users.
	MW118I, MW118D, MW119, MW130, MW131 are planned to be added to the upcoming OMP revision and were therefore included as a part of the October - December 2024 monitoring event.	Additional data points - These wells will monitor PFAS mass flux across the base boundary as they are located on the plume centreline and add overall data resolution to the program.

SAQP	Deviation	Impact on OMP
		MW119 was recorded as dry so not sampled on this occasion.
	MW106 and MW801S are planned to be added to the upcoming OMP revision and were therefore included as a part of the October - December 2024 monitoring event.	Additional data points - These wells will monitor PFAS mass flux downgradient of the former FTA on the base boundary, providing additional monitoring locations to track changes in PFAS concentrations in groundwater resulting from completed soil remediation works.
	MW109, MW109D, MW111 and MW111D are to be added to the upcoming OMP revision and therefore was included as part of the October-December 2024 monitoring event.	Additional data points - These wells will monitor PFAS mass flux downgradient of the FSA on the base boundary, providing additional monitoring locations to track changes in PFAS concentrations in groundwater resulting from completed soil remediation works.
	MW146, MW802S, MW802I and MW802D are planned to be added to the upcoming OMP revision and were therefore included as a part of the October - December 2024 monitoring event.	Additional data points - These wells will monitor the PFAS concentrations in the FSA source area.
	MW803S, MW803I and MW803D are planned to be added to the upcoming OMP revision and were therefore included as a part of the October - December 2024 monitoring event.	Additional data points - These wells will monitor PFAS concentrations in the former FTA source area.
Collection of three biannual groundwater samples	POT122 was not able to be sampled. AECOM have not been able to gain access to the property since January 2022. A new groundwater monitoring well has been installed in November 2024 (MW814) to substitute data historically collected from POT122.	Significant data gap - POT122 tracks PFAS contamination in groundwater in the Emungalan area west of Katherine River where known PFAS impacts have been previously documented. A replacement monitoring well has been installed near this sampling location to address this data gap, however, the new well was not installed prior to this sampling event. The newly installed well will be sampled during the next biannual event in February-March 2025. It is recommended to add as a replacement location for POT122 in the next revision of the SAQP.
Collection of annual groundwater samples within the end of dry season	MW403 data point to be used for interpretation was collected in December 2024:	Minor impact –MW403 was technically collected during the 'start of wet season' (December 2024) rather than the 'end of wet season' (September-

SAQP	Deviation	Impact on OMP
months (September-October)	MW403 (off-base) results from October 2024 reported a new exceedance (1.34 µg/L) of the drinking water guideline for the Sum of Perfluorooctanesulfonic acid and Perfluorohexanesulfonic acid (PFOS+PFHxS). This result was an order of magnitude greater than the historical data collected at this location. The monitoring well was re-sampled on 9 December 2024 and reported a concentration of 0.02 µg/L which is consistent with historical results. Consequently, the initial MW403 concentrations are excluded from further consideration and are replaced with the December 2024 reported concentrations.	October months), results from the December sampling are still expected to reflect the dry seasons conditions. A review of groundwater elevations was conducted between the two sampling events was conducted to determine the appropriateness of using data collected in December as a part of the dry season data set. Groundwater levels increased by 0.229 m AHD between events, indicating that early wet season rain events did have a minor impact on water levels at MW403. However, it is not anticipated that the observed change in groundwater level would have diluted PFAS concentrations back to historical levels within the time between when samples were collected.
Use of National Institute of Measurement (NMI) Sydney as secondary laboratory	During the October 2024 event, National Association of Testing Authorities (NATA) accredited laboratory ALS Environmental Pty Ltd (ALS) Brisbane was used as secondary laboratory instead of NMI as per SAQP.	No impact - The intent of the secondary laboratory is to ensure the results are repeatable when conducted by a different laboratory using different equipment. This ensures both the collected samples and the laboratory equipment utilised provide similar results, indicating both the sample methods and the laboratory equipment are adequate for providing accurate results. Therefore, the use of ALS Brisbane instead of NMI as the secondary laboratory has no material impact on the resulting data quality.

The annual biota sampling event in October 2024 did not have any deviations from the SAQP (AECOM, 2023).

3.0 Sampling methodology

3.1 Adopted methodology

The methodologies adopted for the groundwater, biota and surface water were in accordance with the applicable revision of the SAQP (AECOM, 2023), noting that deviations in sampling locations have already been discussed in **Section 2.3** above.

Table 11 Groundwater and surface water sampling methodology

Item	Details
Groundwater and surface water methodology	
Groundwater gauging	Depth to groundwater and total depths were measured prior to collection of groundwater samples using a decontaminated oil/water interface probe. Gauging was performed where possible at monitoring wells, noting that extraction bores fitted with taps are not accessible for gauging.
Groundwater sample collection	Groundwater samples were collected from accessible monitoring wells using no-purge methodology HydraSleeves™, which were installed within the screened interval of the wells for a minimum of 24 hours prior to the sampling round. HydraSleeve™ positioning was based on a review of the well construction log and ~dropping either 3 m below the measured groundwater depth or one metre below the top of the screened section (whichever is deepest). Extraction bore water samples were collected from existing taps on the headworks of the extraction bore or from the closest accessible sampling point from the extraction bore. Samples were collected from the 'first-flush' from the tap.
Surface water sample collection	Surface water samples were collected from either mid-way through the water column or approximately 0.5 m below the surface, dependent on water depth, with care taken to minimise collection of sediment or floating materials in the samples. At each location, laboratory supplied bottles were lowered into the water using a decontaminated aluminium sampling pole with the cap immediately applied once the container was full and retrieved from the water.
Water quality parameters	Water quality parameters were recorded ex-situ, post-sample collection, using a YSI Pro Water Quality Meter. Water quality measurements recorded consisted of the following: temperature (°C), electrical conductivity (EC), dissolved oxygen (DO), oxidation-reduction potential (reported as redox), and pH. Observations of odour, colour and clarity (low, moderate or high turbidity) of the samples collected were recorded at each location.
QA/QC samples	For water sampling, field QA/QC samples included intra-laboratory duplicate and inter-laboratory duplicates at a rate of 1 in 10 primary samples, rinsates at a rate of 1/day where decontaminated equipment was used, field blanks at a rate of 1/sampling day and trip blank samples at a rate of 1/cooler.
Sample analysis	Samples were submitted to the primary and secondary laboratories for PFAS analysis. ALS Sydney, New South Wales (NSW) was used as the primary laboratory. NMI of Sydney, NSW and ALS Brisbane was used as the secondary laboratories. ALS and NMI methods for analyses are certified by NATA.
Aquatic biota sampling	
Aquatic biota target samples	Target species for each identified sample location were based on those that are recognised as consumed by the public from the following two groups:

Item	Details
	• Fish (Barramundi (Lates calcarifer), Sooty Grunter/ Black Bream (Hephaestus fuliginosus), Bony Bream (Nematalosa erebi), Butler's Grunter (Syncomistes butleri), Mullet (Planiliza ordensis)), Archerfish (Toxotes chatareus), Sleepy Cod (Oxyeleotris lineolata), Black Catfish (Neosilurus ater), and Blue Catfish (Neoarius graeffei)) • Crustaceans (Cherabin (Macrobrachium spinipes)).
Aquatic biota sampling methodology	Sampling was conducted by Eco Logical Australia Pty Ltd and the Department of Fisheries (NT) on 15, 16 and 17 October 2024. Ethics approvals and Fisheries/Parks & Wildlife licenses were obtained prior to biota sample collection. Targeted fish and aquatic invertebrates were collected using an electrofishing boat, using methods that comply with the guidelines set out by the Australian Code of Electrofishing Practice. Stunning used the minimum power necessary to attract and stun the biota effectively. Electrofishing occurred for 5 – 10 minutes per pool, or until adequate samples were collected. Selected biotas were identified, measured, weighed and euthanized humanely according to the animal ethics permit conditions, and all non-target species were released from electrical current immediately. Samples were prepared for analysis at the Department of Fisheries laboratory prior to dispatching to the primary laboratory. This included the removal of scales/shell, head, and internal organs. Fillets were taken with skin intact and homogenised prior to sub-sampling and analysis. Samples were prepared based on the following procedure: • For Target fish: - Used opened bag as board cover - Cleaned knife/blade with deionised water - For large fish the complete tissue samples of edible flesh were collected - For smaller fish, samples were provided whole with entrails removed. • The weight, length, species, and location caught were recorded.
QA/QC samples	Field QA/QC samples collected included rinsate and intra- and inter-laboratory duplicates which are described as the following: • Rinsate samples were taken from decontaminated sample processing equipment (filleting knife) • Duplicates were taken from fin fish to ensure homogeneity for intra-laboratory analysis rather than composite samples of crustaceans.
Sample analysis	All samples collected were tested for the extended suite of PFAS. Samples were submitted to the primary laboratory for analysis in accordance with the SAQP (AECOM, 2023). ALS Sydney, NSW was used as the primary laboratory. ALS methods for analyses were certified by the NATA.

3.2 Adopted screening criteria

Screening criteria were selected on the basis of national guidance in the form of the PFAS National Environmental Management Plan, Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance. Guidance documents used to assess the dataset includes the following:

- Department of Health (DoH) Health Based Guidance Values for PFAS for use in site investigations in Australia (Department of Health, 2019)
- Heads of the Environment Protection Authority (HEPA), PFAS National Environmental Management Plan (PFAS NEMP 3.0) (HEPA, 2025)

- National Health and Medical Research Council (NHMRC), Guidance on PFAS in Recreational Water (NHMRC, 2019).
- National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, (ASC NEPM, 2013).

A summary of screening criteria used for groundwater and surface water matrices are presented in **Table 12** below.

Table 12 Summary of adopted screening criteria for surface water and ground water

Pathway	Compound	Criteria	Comment/reference
Human health receptors			
Drinking water	PFOS+PFHxS	0.07 micrograms per litre (µg/L)	These values are from the PFAS NEMP 3.0 (HEPA, 2025).
	Perfluorooctanoic acid (PFOA)	0.56 µg/L	
Recreational use	PFOS+PFHxS	2 µg/L	These values are from PFAS NEMP 3.0 (HEPA, 2025).
	PFOA	10 µg/L	
Ecological receptors			
Freshwater 99% species protection	PFOS	0.00023 µg/L	These values are from the PFAS NEMP 3.0 (HEPA, 2025). *The 99% level of protection has been applied for slightly to moderately disturbed ecosystems. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife. For the purposes of preliminary screening of analytical water results, the laboratory LOR will be adopted rather than sole use of the criteria value.*
	PFOA	19 µg/L	

The drinking water guideline value has been applied to surface water as the town water supply is partially sourced from surface water from the Katherine River, and the interaction between surface and groundwater due to groundwater expressing through springs and surface water infiltrating into groundwater through sinkholes. The recreational water guideline value has also been applied to groundwater due to groundwater expressing through springs and the use of groundwater extraction for irrigation and recreational use such as the filling of private swimming pools and potentially public swimming pools.

Further to the adopted screening criteria, the OMP (Defence, 2021a) outlines site-specific trigger points that data is to be reviewed against. The OMP triggers are summarised in **Table 13** below, with recommended actions (if triggers are met) outlined in the OMP (Defence, 2021a).

Table 13 OMP Trigger Points

Locations	Trigger Point
Groundwater locations previously below laboratory LOR for PFAS	First time detection of PFAS compounds in groundwater
All monitoring locations (groundwater, surface water or biota)	PFOS+PFHxS and/or sum of PFAS concentrations show an increasing trend (using statistical analysis) over two years of monitoring or increase by >30% in one year.

Locations	Trigger Point
	PFOS+PFHxS and/or sum of PFAS concentrations show decreasing trend (using statistical analysis) over two years of monitoring or decrease by >30% in one year.
All groundwater monitoring locations	Groundwater monitoring well is not able to be sampled as it is dry, blocked, damaged, decommissioned, inaccessible, lost etc.
Groundwater private bores in Cossack and Emungalan	PFOS+PFHxS and/or sum of PFAS concentrations in a bore show an increasing trend (using statistical analysis) over two years of monitoring or increase by >30% in one year. Or, concentrations are reported above the adopted drinking water health-based screening level.
Groundwater private bore on Uralla Road (POT111)	Concentrations of PFAS are reported in POT111 which indicate an increase in plume size or concentrations above drinking water guidelines.
Groundwater private bore on Gorge Road (POT119)	Detectable concentrations of PFAS are reported in POT119.
MW734	PFOS+PFHxS and/or sum of PFAS concentrations at MW734 show an increasing trend (using statistical analysis (over two years of monitoring or increase by >30% in one year.

If sample points meet any of the triggers listed above, the sample has been highlighted in blue (first time detection of PFAS) or yellow (new exceedance of human health criteria) in analytical tables, found in **Appendix B.** Additional trigger points in relation to trend analysis are listed in the OMP (Defence, 2021a). These trigger points are taken into consideration during the annual OMR.

Additional trigger points in relation to trend analysis are listed in the OMP (Defence, 2021a). These trigger points are taken into consideration during the annual OMR.

Table 14 Summary of adopted screening criteria for consumption of aquatic biota

Pathway	Compound	Criteria	Comment/reference
Human health receptors			
Crustaceans	PFOS and PFOS+PFHxS	65 (µg/kg)	Department of Health (2019) *Derivation: Children 2-6 years, median consumption* Occasionally consumed food. Trigger criteria for investigation for crustaceans apply to molluscs due to the small number of consumers of molluscs.
	PFOA	520 µg/kg	
Finfish	PFOS and PFOS+PFHxS	5.2 µg/kg	Department of Health (2019). *Derivation: Children 2-6 years, P90 consumption*

3.3 Data quality objectives and data validation

The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2023)**.**

The data validation report is provided in **Appendix D**.

The analytical data can be used as a basis for interpretation, subject to the limitations outlined below:

- The potential exists for concentrations of PFOS to be below the laboratory LOR, but above the PFOS and PFOA Freshwater 99% Species Protection guidelines in all groundwater and surface water samples, with the exception of groundwater sample 0990_POT120_230726 which reported a PFOS concentration above the LOR and adopted guideline and should be taken into consideration when interpreting results.

- MW403 reported a new exceedance (1.34 µg/L) of the drinking water guideline for PFOS+PFHxS. This result was an order of magnitude greater than the historical data collected at this location and therefore this anomaly conflicted with the groundwater conceptual site model (CSM). The reported PFAS concentrations were suspected to be inaccurate as a result of either errors in laboratory testing or field sampling. The source of the potential error could not be determined with certainty and therefore the well was re-sampled on 9 December 2024 and reported a concentration of 0.02 µg/L which is consistent with historical results from this location collected since 2017. A review of groundwater elevations was conducted between the two sampling events was conducted to determine the appropriateness of using data collected in December as a part of the dry season data set. Groundwater levels increased by 0.229 m AHD between events, indicating that early wet season rain events did have a minor impact on water levels at MW403. However, it is not anticipated that the observed change in groundwater level would have diluted PFAS concentrations back to historical levels within the time between when samples were collected.
- The surface water and groundwater monitoring events were completed in conjunction with an ad-hoc groundwater sampling event which has been reported separately. Parent samples for the field intra-laboratory and inter-laboratory duplicates reflect these ad-hoc locations. The data validation has been assessed as an all-inclusive event.
- The elevated RPD suggests that concentrations of PFOS in the primary laboratory batch, ES2434947, may be biased high by up to 78 %. However, elevated RPDs are expected in biota due to the heterogeneous distribution of PFAS in the matrix type. As a conservative approach, the higher concentrations have been used for assessment against criteria.

Data validation procedures employed in the assessment of the field and laboratory QA/QC data are indicative that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report. An examination of sampling analysis data compared to the data validation findings did not result in any results that required flagging for potential inaccuracies.

All data collected during these events has been reviewed and uploaded to the Defence ESdat database in accordance with DCMM (Defence, 2021b) Annex L requirements.

4.0 Results and discussion

4.1 Surface water

4.1.1 Surface water field observations and measurements

Table 15 Surface water observations and field measurements for October - December 2024 sampling events.

Compound	Criteria
Fieldwork dates	The biannual and quarterly surface water sampling occurred on 30 October and 1 November 2024. One annual surface water location (SW151) was sampled earlier on 16 October 2024 in conjunction with the biota sampling.
Access and sample collection	All annual and biannual surface water sampling locations were accessible and sampled. One quarterly surface water location, OTH008, was unable to be accessed due to the facility being closed for renovations.
Field observations	Katherine River generally had moderate flows with low turbidity, no odour or sheen. The Katherine Hot Springs was noted to be colourless with moderate flow, low turbidity, no odour and no sheen.
Surface water level	The Katherine River level was recorded as being at approximately 0.236 m on 16 October 2024 and 0.265 m on 30 October July 2024 at the Katherine River Railway Bridge, recorded from Station G814001 (Northern Territory Department of Lands, Planning and Environment, 2024)**.**
Water quality measurements	Stabilised water quality parameter readings are presented in **Table T1 - Appendix B** and are summarised below per event below, excluding the annual surface water sample in which parameters were not collected: **Biannual event October - December 2024:** • DO ranged from 5.33 mg/L (SW161) to 7.18 mg/L (SW100) indicating oxygenated water • EC ranged from 79.3 µS/cm (SW161) to 586 µS/cm (SW100) indicating freshwater conditions • pH ranged from 5.27 (SW100 and SW110) to 5.34 (SW161) indicating acidic conditions • Redox (corrected) ranged from 305.6 mV (SW161) to 351.0 mV (SW100) indicating oxidising conditions. **Quarterly event October 2024:** • DO ranged from 4.45 mg/L (SW153) to 5.96 mg/L (SW108) indicating oxygenated water • EC ranged from 470.9 µS/cm (SW108) to 683 µS/cm (SW153) indicating freshwater conditions • pH ranged from 5.13 (SW153) to 5.27 (SW108) indicating acidic conditions • Redox (corrected) ranged from 337.5 mV (SW108) to 353.4 mV (SW153) indicating oxidising conditions.

4.1.2 Surface water analytical results

Analytical results from the annual, biannual and quarterly surface water sampling events were consistent with the historical data set. Discussion of any deviations from the SAQP that occurred are presented in **Section 2.3**. There were no OMP trigger point exceedances from these results.

The PFAS surface water analytical results from the October - December 2024 sampling events are presented in **Table T2 - Appendix B**.

4.2 Groundwater results

4.2.1 Groundwater field observations and measurements

Table 16 Groundwater field observations and measurements

Compound	Observation and field measurements
Fieldwork dates	The annual groundwater sampling was completed between 15 October 2024 and 1 November 2024, with one location (MW403) re-sampled on 9 December 2024. The biannual and 'once in dry season' groundwater sampling was completed between 15 October and 30 October 2024.
Access and sample collection	All groundwater samples were collected as per the SAQP (AECOM, 2023) with the exception of the deviations listed in **Section 2.3** above. One annual groundwater sample location (MW403) recorded a new exceedance of the selected human health criteria which triggered a resample of groundwater at this location approximately 5 weeks later (completed in December 2024). Both results are shown in analytical tables and are explained further in **Section 4.2.2** below.
Water quality measurements	Water quality measurements were taken during sample collection using a YSI Pro Water Quality Meter. Stabilised readings are presented in **Appendix B.** **Annual event October – December 2024 (Table T5a)**: • DO ranged from 0.53 mg/L (MW136) to 5.34 mg/L (POT111 – extraction bore) indicating hypoxic to oxygenated water. • EC ranged from 225.6 µS/cm (MW231) to 1577 µS/cm (MW802S) indicating fresh to slightly brackish water conditions • pH ranged from 5.24 (MW140) to 7.23 (MW802S) indicating acidic to neutral conditions • Redox (corrected) ranged from 162.6 mV (MW244) to 393.8 mV (MW136) indicating oxidising conditions. **Biannual event October 2024 (Table T5a)**: • DO ranged from 2.11 mg/L (OTH114) to 5.57 mg/L (OTH120) indicating oxygenated water conditions • EC ranged from 682 µS/cm (OTH120) to 748 µS/cm (OTH114) indicating freshwater conditions • pH ranged from 5.08 (OTH114) to 5.39 (OTH120) indicating acidic conditions • Redox (corrected) ranged from 321.4 mV (OTH120) to 346.5 mV (OTH114) indicating oxidising conditions. **"Once in dry season" private bore event October 2024 (Table T5b)**: • DO ranged from 2.29 mg/L (POT127) to 9.162 mg/L (POT128) indicating oxygenated water conditions • EC ranged from 691 µS/cm (POT120) to 1027 µS/cm (POT127) indicating freshwater conditions • pH ranged from 5.08 (OTH114) to 7.74 (POT121) indicating acidic to near neutral conditions • Redox (corrected) ranged from 213.8 mV (POT114) to 367.4 mV (POT120) indicating oxidising conditions.

Compound	Observation and field measurements
Groundwater levels	During the annual sampling event in October – December 2024, groundwater levels were measured from monitoring wells only, as sampled extraction bores do not permit access for groundwater level measurements. Standing water levels ranged from 4.0 metres below top of casing (mbTOC) (MW146) to 17.9 mbTOC (MW135). Groundwater elevations were then calculated using available top of casing elevation data in metres above Australian Height Datum (mAHD) and ranged from 89.5 mAHD (MW137) to 137.2 mAHD (MW149). Elevations are presented in **Table T5a - Appendix B** and inferred that groundwater flows from east to west, towards Katherine Township and River.

4.2.2 Groundwater analytical results

Analytical results from the annual, biannual and 'once in dry season' private bore sampling events were consistent with the historical data set, with further discussion of any deviations from the SAQP (AECOM, 2023) that occurred in **Section 2.3**. Only one location met an OMP trigger point criteria as shown below in **Table 17.**

Table 17 Locations that meet OMP trigger criteria

OMP Trigger	Location ID	PFOS+PFHxS concentration (µg/L)
		Dry season 2024
Exceedance of human health criteria for sum of PFHxS+PFOS and/or PFOA in Cossack private property bores	POT112 (Oct-24)	0.18

POT112 has consistently reported concentrations of PFOS+PFHxS above the LOR since its first sampling in November 2017, ranging between 0.02 µg/L (April 2024) and 0.14 µg/L (January 2024). The first time POT112 reported above the human health drinking water guidelines (0.07 µg/L) was April 2021. Since then, POT112 has sporadically reported above the drinking water guidelines, usually during late wet season months when the water table is high. As per the recommended trigger points actions outlined in the OMP (Defence, 2021a), provision of alternative water supply has been arranged, and the landowner has been informed of the risks of utilising the bore water for drinking.

Monitoring locations with reported PFOS+PFHxS concentrations above their assigned PMAP (Defence, 2019a) designated management zone concentrations ranges for groundwater are presented in **Table 18.** The management zone ranges are shown in **Figure F1 – Appendix A.**

Table 18 Locations reported PFOS+PFHxS concentrations above the PMAP (Defence, 2019a) designated management zones ranges.

Assigned Zone	Private Property Event October 2024	Annual Event October 2024
1 – Groundwater > Recreation Drinking Water Criteria (2 µg/L)	Nil	MW400 (2.21 µg/L)
2 – Groundwater > Drinking Water Criteria (0.07 µg/L)	Nil	Nil
5 – Groundwater < Criteria (<0.07 µg/L)	POT112 (0.18 µg/L)	Nil

The groundwater analytical results from the three dry season sampling events are presented in **Table T4 - Appendix B.**

4.3 Biota

4.3.1 Field observations and field measurements

Table 19 Biota observations

Item	Observation
Field Observations	Sample descriptions were provided by NT Fisheries field staff following the biota sampling event via an excel spreadsheet, noting fauna group, species type and weight. These are presented in **Table T7 - Appendix B**.
Access and Sample Collection	All monitoring locations were accessible, and 40 samples were able to be collected and analysed. Fish and invertebrate species collected and analysed included: BIO088 (Katherine River - downstream of Stuart Hwy): • Barramundi (Lates calcarifer) • Sooty Grunter / Black Bream (Hephaestus fuliginosus) • Mullet (Planiliza ordensis) • Sleepy Cod (Oxyeleotris lineolata) • Bony Bream (Nematalosa erebi) • Cherabin (Macrobrachium spinipes) BIO078 (Katherine River – Galloping Jacks): • Barramundi (Lates calcarifer) • Sooty Grunter / Black Bream (Hephaestus fuliginosus) • Mullet (Planiliza ordensis) • Bony Bream (Nematalosa erebi) • Sleepy Cod (Oxyeleotris lineolata) • Blue Catfish (Neoarius graeffei) • Black Catfish (Neosilurus ater) • Cherabin (Macrobrachium spinipes)

4.3.2 PFAS biota analytical results

Analytical results from the annual biota sampling events were consistent with the historical data set, with further discussion of any deviations from the SAQP that occurred in **Section 2.3**. There were no OMP trigger point exceedances from these results. The annual biota analytical results are presented in **Table T7 - Appendix B**.

5.0 Summary and next sampling events

5.1 Summary of monitoring events

Findings of the dry season 2024 monitoring period and recommended actions are summarised in **Table 20** below with OMP trigger conditions and recommended actions summarised in **Table 21.**

Table 20 Summary of sampling event

Item	Comment	Recommended Actions
28 annual groundwater locations were sampled in October 2024	23 or 28 locations were sampled. Five locations were not able to be sampled due reasonings outlined in **Table 21** below.	See below OMP trigger point recommendations.
Annual location MW403 was resampled in December 2024 to confirm results.	Results for MW403 (off-base) from October 2024 reported a new exceedance (1.34 µg/L) of the drinking water guideline for the PFOS+PFHxS. This result was an order of magnitude greater than the historical data collected at this location.	The monitoring well was re-sampled on 9 December 2024 and reported a concentration of 0.02 µg/L which is consistent with historical results. Consequently, the initial MW403 concentrations are excluded from further consideration and have been replaced with the December 2024 reported concentrations. Continue monitoring MW403 in accordance with the SAQP and PMAP.
An additional 19 groundwater locations were added to the annual event	The following locations were also visited during the annual groundwater event: • MW106 • MW109 • MW109D • MW111D • MW111 • MW118D • MW118I • MW118 • MW130 • MW131 • MW136 • MW146 • MW801S • MW802D • MW802I • MW802S • MW803D • MW803I • MW803S	It is recommended to add these locations to the next revision of the OMP and therefore the SAQP.
Two of three biannual groundwater samples were collected in October 2024.	POT122 was not able to be sampled. AECOM have not been able to gain access to the property since January 2022. A new groundwater	Continue monitoring groundwater from this area in accordance with the SAQP and PMAP. Monitoring location MW814 is planned to

Item	Comment	Recommended Actions
	monitoring well, in publicly accessible land. has been installed in November 2024 (MW815) to provide an accessible location to collect data historically collected from POT122.	replace POT122 in the next revision of the OMP and SAQP.
18 'once in dry season' groundwater samples were collected in October 2024.	Nil	Continue monitoring in accordance with the SAQP and PMAP.
Biota samples were collected from two locations along Katherine River in October 2024.	Nil	Continue monitoring in accordance with the SAQP and PMAP.
Two of three quarterly surface water samples were collected in October 2024.	The Katherine Town Pool (OTH008) has been closed for renovations for the past three events. As this location monitors for potential health risks from PFAS within the swimming pool, there are no potential risk to the public while the pool is not in operation.	OTH008 will be sampled upon completion of the facility renovations. Continue monitoring in accordance with the SAQP and PMAP.
Three biannual surface water samples were collected in October 2024	Nil	Continue monitoring in accordance with the SAQP and PMAP.
One annual surface water sample was collected in October 2024	Nil	Continue monitoring in accordance with the SAQP and PMAP.

Table 21 OMP trigger point

Trigger Point	Comment	Recommended Actions
First time detection of PFAS compounds in groundwater.	There were no first-time detections above the LOR for PFOS+PFHxS or PFOA in groundwater or surface water.	Continue monitoring in accordance with the SAQP and PMAP.
PFOS+PFHxS and/or sum of PFAS concentrations show an increasing trend (using statistical analysis) over two years of monitoring or increase by >30% in one year.	This will be evaluated in the annual OMR using statistical analysis.	Continue monitoring in accordance with the SAQP and PMAP.
PFOS+PFHxS and/or sum of PFAS concentrations show decreasing trend (using statistical analysis) over two years of monitoring or decrease by >30% in one year.	This will be evaluated in the annual OMR using statistical analysis.	Continue monitoring in accordance with the SAQP and PMAP.

Trigger Point	Comment	Recommended Actions
Groundwater monitoring well is not able to be sampled as it is dry, blocked, damaged, decommissioned, inaccessible, lost etc.	There were five annual groundwater locations that were not sampled: 1. MW117 presented as dry and it's SAQP listed alternative, MW118, was also dry 2. MW134 could not be sampled due to root blockage 3. MW138 could not be sampled due to root blockage 4. MW235 was not able to be sampled as it was decommissioned prior to soil remediation works commencing at the former FTA. POT119 could not be sampled due to not being able to obtain a signed access letter from the owner. This is consistent with previous annual events with the last time POT119 being sampled was April 2021.	1. Root blockages at MW134 and MW138 have since been cleared during a drilling program in November 2024. Continue monitoring in accordance with the SAQP and PMAP. An attempt will be made to unblock the well during the next annual event. 2. MW117 is a shallow well and is consistent with previous events that they are dry at the end of the dry season. Continue monitoring in accordance with the SAQP and PMAP. 3. MW118 is a shallow well and is consistent with previous events that they are dry at the end of the dry season. Continue monitoring in accordance with the SAQP and PMAP. 4. MW235 is no longer available to sample and is recommended to be removed from the OMP and SAQP in the upcoming revision A replacement well for POT119 has since been installed near this sampling location on public land. The newly installed well (MW815) will be sampled during the next event. It is recommended to add the new well as a replacement location for POT119 in the next revision of the SAQP and OMP.
Concentrations are reported above the adopted drinking water health-based screening level in a Cossack or Emungalan private bore..	One private property bore reported concentrations of PFAS above the drinking water screening criteria (0.07 µg/L) POT112 reported concentrations of PFOS+PFHxS to be 0.18 µg/L which is within the same order of magnitude as historical results.	• Provision of alternative water supply has been arranged. Landowner has been informed of the risks of utilising the bore water for drinking.
Concentrations of PFAS are reported in POT111 which indicate an increase in plume size or concentrations above drinking water guidelines.	Concentrations of PFAS at POT111 were reported below the LOR during the annual sampling event in October 2024.	Continue monitoring in accordance with the SAQP and PMAP.
Detectable concentrations of PFAS are reported in POT119.	Private property location POT119 was not able to be	A replacement well for POT119 has been installed near this

Trigger Point	Comment	Recommended Actions
	accessed due to not receiving a signed access letter from landowner.	sampling location on public land. The newly installed well (MW815) will be sampled during the next event. It should be noted that MW815 was installed after the completion of the annual event, and therefore not sampled during this reporting period.
PFOS+PFHxS and/or sum of PFAS concentrations show an increasing trend.	This will be evaluated in the annual OMR using statistical analysis.	Continue monitoring in accordance with the SAQP and PMAP.
PFOS+PFHxS and/or sum of PFAS concentrations show a decreasing trend.	This will be evaluated in the annual OMR using statistical analysis.	Continue monitoring in accordance with the SAQP and PMAP.

5.2 Upcoming sampling events

The next groundwater sampling event will be the ‘monthly in wet season’ groundwater sampling, which will occur each month from November 2024 through to April 2025. The next biota sampling will be scheduled for October 2025. The next surface water sampling event will be the ‘twice in wet’ season event, scheduled for when the first rains of the wet season start, nominally November 2025.

Note:
mg/l = miligrams per litre
°C = degrees celsisus
µS/cm = microsiemens per centremetre
mV = millivolts
Redox Corrected = Redox + 200
* Calculated value were TDS = EC*0.64

Note:
mg/l = miligrams per litre
°C = degrees celsisus
µS/cm = microsiemens per centremetre
mV = millivolts
Redox Corrected = Redox + 200
* Calculated value were TDS = EC*0.64

Data Validation Report

AECOM

DATA VALIDATION REPORT; WATER

Project Manager:	[redacted]	**Validation by:**	[redacted]
Project number:	60676801	**Date:**	27/05/2025
Site:	0990 – RAAF Base Tindal		
Matrix:	Water	**Data Verified by:**	[redacted]
Laboratory:	ALS Sydney & NMI Sydney	**Date:**	30/05/2025
Lab reference:	ES2420210, RN1433170* (*Secondary laboratory)		

Key Findings:

The analytical data can be used as a basis for interpretation.

Component		Outliers			Material impact on interpretation
		No	Yes	Comment	
Frequency of field quality assurance/quality control		✓			No
Number of tests requested/reported		✓			No
Sample handling/preservation/holding times			✓	1	No
Frequency of laboratory QA/QC			✓	2	No
Limits of reporting (LOR)		✓			No
Blank analysis	Field blank	✓			No
	Rinsate blank	✓			No
	Trip blank	✓			No
	Method blank	✓			No
Field intra-laboratory relative percent differences (RPDs)		✓			No
Field inter-laboratory RPDs			✓	3	No
Laboratory duplicate RPDs		✓			No
Matrix spike (MS) % recoveries		✓			No
Laboratory control spike (LCS) % recoveries		✓			No
Surrogate % recoveries		✓			No
Other comments		✓			No

Comments

1. Sample handling/ preservation/ holding times

Sample Preservation

The following laboratory batches were received outside of the recommended temperature range (≤6°C):

Batch Number	Temperature (°C)
ES2420210	14.8 °C
RN1433170	Chilled

Potential under reporting must be taken into consideration. However, the potential for under reporting is not considered to materially affect the interpretation of results due to the nature of PFAS not degrading via volatilisation. Further, the samples were received below the ambient groundwater temperature at the time of sampling (~30 °C) and the samples were immediately cooled upon collection.

PRINTED COPIES ARE UNCONTROLLED FOR 3 MONTHS FROM 30-MAY-25 AND THEN MUST BE REPRINTED

DATA VALIDATION REPORT; WATER

Project Manager:	[redacted]	**Validation by:**	[redacted]
Project number:	60676801	**Date:**	27/05/2025
Site:	0990 – RAAF Base Tindal		
Matrix:	Water	**Data Verified by:**	[redacted]
Laboratory:	ALS Sydney & NMI Sydney	**Date:**	30/05/2025
Lab reference:	ES2420210, RN1433170* (*Secondary laboratory)		

2. Frequency of laboratory QA/QC	Laboratory duplicate samples were not reported at the required frequency for PFAS (actual/expected rate (%)) (0.00%/10.00%). The precision of the data can be assessed as acceptable based on the field intra- and inter-laboratory duplicate RPDs which were reported at the required frequencies and within control limits.
3. Field inter-laboratory RPDs	Field inter-laboratory RPDs were reported within control limits, except for the following samples (higher concentration in **bold):** • **0990_SW108_240619** & 0990_QC200_240619 for PFHxS (40%) As concentrations of PFHxS for both samples are less than 10 x LOR, where precision is low and actual differences minor, the data is considered to be of an acceptable precision and these elevated RPDs are not considered to affect the interpretation of results against guidelines.

October SW:
ES2435723, EB2438417

Key Findings:

The analytical data can be used as a basis for interpretation, subject to the limitations outlined below:

- The potential exists for concentrations of PFOS to be below the LOR, but above the PFAS Freshwater 99% Species Protection guideline in all groundwater and surface water samples (with the exception of groundwater sample 0990_POT120_230726 which reported above the LOR and adopted guideline, and should be taken into consideration when interpreting results.
- The surface water and groundwater monitoring events were completed in conjunction with an ad-hoc groundwater sampling event which has been reported separately. Parent samples for the field intra-laboratory and inter-laboratory duplicates reflect these ad-hoc locations. The data validation has been assessed as an all-inclusive event.

1. Sample handling/ preservation/ holding times

The following laboratory batches were received outside of the recommended temperature range (≤6°C):

Batch Number	Temperature (°C)
ES2435725	9.2
ES2435721	9.3
ES2433855, ES2433854, ES2433853, ES2433852, ES243385, ES2433850, ES2433848, ES2433847, ES2433846, ES2433845, ES2433844, ES2433843, ES2433842, ES2433841, ES2433840, ES2433839, ES2433838, ES2433837	7.7
EB2438420	16.1
EB2436756	13.9
ES2435730	8.2
ES2435725	9.2
ES2435724	10.7
EB2438420	16.1
EB2438426	16.1
ES2435723	9.3
EB2438417	16.1

Potential under reporting must be taken into consideration. However, the potential for under reporting is not considered to materially affect the interpretation of results due to the nature of PFAS not degrading via volatilisation. Further, the samples were received below the ambient groundwater and surface water temperature at the time of sampling (~30 °C) and the samples were immediately cooled upon collection

2. Frequency of laboratory QA/QC	Laboratory duplicate samples were not reported for at the required frequency for PFAS in primary batches ES2435725, ES2433855, ES2433854, ES2433853, ES2433852, ES2433851, ES2433850, ES2433848, ES2433847, ES2433846, ES2433845, ES2433844, ES2435779, ES2435730, ES2435729, ES2435728, ES2435724 and ES2435723. The precision of the data can be assessed as acceptable based on intra- and inter-laboratory duplicate RPDs which were reported at the required frequencies and within control limits. Matrix spikes were not reported at the required frequencies for PFAS method group in primary batches ES2435725, ES2433855, ES2433854, ES2433853, ES2433852, ES2433851, ES2433850, ES2433848, ES2433847, ES2433846, ES2433845, ES2433844, ES2435779, ES2435730, ES2435729, ES2435728, ES2435724 and ES2435723. The accuracy of the data can be assessed as acceptable based on method blanks, LCS and surrogate spike recoveries (which were reported at the required frequencies and within control limits), and available matrix spike recoveries for the same analytical method group (which were reported within control limits).

3.Limits of reporting	Limits of reporting (LOR) were sufficiently low to enable assessment against adopted guideline criteria, with the exception of PFOS in water. The potential exists for PFOS to be above the adopted PFAS Freshwater 99% Species Protection guideline (0.00023 µg/L), but below the laboratory LOR (0.01 µg/L) in all groundwater and surface water primary samples collected, excluding the following samples that have reported above the LOR and the guideline value • 0990_MW104_241017 • 0990_MW106_241018 • 0990_MW107_241018 • 0990_MW109_241018 • 0990_MW109D_241018 • 0990_MW110_241018 • 0990_MW111D_241018 • 0990_MW111S_241018 • 0990_MW118D_241018 • 0990_MW118I_241018 • 0990_MW127_241018 • 0990_MW129_241019 • 0990_MW130_241018 • 0990_MW131_241018 • 0990_MW133_241101 • 0990_MW135_241021 • 0990_MW136_241020 • 0990_MW137_241020 • 0990_MW140_241101 • 0990_MW142_241019 • 0990_MW146_241019 • 0990_MW149_241019 • 0990_MW231_241020 • 0990_MW244_241021 • 0990_MW278_241022 • 0990_MW285_241022 • 0990_MW400_241019 • 0990_MW403_241017 • 0990_MW801S_241018 • 0990_MW802D_241019 • 0990_MW802I_241019 • 0990_MW802S_241019 • 0990_MW803D_241017 • 0990_MW803I_241017 • 0990_MW803S_241017 • 0990_OTH114_241030 • 0990_POT112_241015 • 0990_POT113_241015 • 0990_POT120_241030 • 0990_POT121_241016 • 0990_SW100_241030 • 0990_SW108_241030 • 0990_SW153_241030 This should be taken into consideration when interpreting PFOS results against guidelines where results are reported below the LOR.
4. Field intra-laboratory relative percent differences (RPDs)	Field intra-laboratory RPDs were reported within control limits, with the exception of the following samples (higher concentration in **bold**):

October SW:
ES2435723, EB2438417

- 0990_POT112_241015 & **0990_QC100_241015** for Perfluoropentanoic acid (PFPeA)(40%)
- 0990_MW803D_241017 & **0990_QC100_241017** for 6:2 Fluorotelomer sulfonic acid (6:2 FTS) (67%)
- **0990_MW802S_241019** & 0990_QC102_241019 for Perfluorohexane sulfonate (PFHxS) (34%)
- 0990_MW135_241021 & **0990_QC103_241021** for Perfluorooctanoic Acid (PFOA) (67%)
- 0990_MW135_241021 & **0990_QC103_241021** for Perfluorooctane sulfonate (PFOS) (45%)

As there are no adopted guidelines for PFPeA, the RPD exceedances for this analyte is not expected to affect interpretation of results. However, the RPD exceedance for should be taken into considering when using PFPeA concentrations quantitatively.

As concentrations of PFHxS, PFOA and PFOS were reported well above or well below the adopted guidelines, the elevated RPDs are not considered to affect the interpretation of results against guidelines. However, as a conservation approach, the higher concentrations is to be used. The elevated RPDs are also to be taken into consideration when using the data quantitatively.

*RPDs have only been considered where a concentration is greater than 1 times the LOR.
**Elevated RPDs are highlighted as per QAQC Profile settings
(Acceptable RPDs for LOR multiplier range are:
30 (1 - 10 x LOR); 30 (10 - 30 x LOR); 30 (> 30 x LOR))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories.
Any methods in the row header relate to those used in the primary laboratory

DATA VALIDATION REPORT; WATER & BIOTA

Project Manager:	[redacted]	**Validation by:**	[redacted]
Project number:	60676801	**Date:**	16/12/2024
Site:	0990 – RAAF Tindal		
Matrix:	Water & Biota	**Data Verified by:**	[redacted]
Laboratory:	ALS Sydney; NMI Sydney	**Date:**	17/12/2024
Lab reference:	ES2434947; RN1449010		

Key Findings:

The analytical data can be used as a basis for interpretation, subject to the limitations outlined below:

- The elevated RPD suggests that concentrations of PFOS in the primary laboratory batch, ES2434947, may biased high by up to 78%. This is to be taken into consideration when assessing samples that report PFOS concentrations close to the selected criteria.

Component		Outliers			Material impact on interpretation
		No	Yes	Comment	
Frequency of field quality assurance/quality control		✓			No
Number of tests requested/reported		✓			No
Sample handling/preservation/holding times		✓			No
Frequency of laboratory QA/QC		✓			No
Limits of reporting (LOR)		✓			No
Blank analysis	Field blank	✓			No
	Rinsate blank	✓			No
	Trip blank	✓			No
	Method blank	✓			No
Field intra-laboratory relative percent differences (RPDs)		✓			No
Field inter-laboratory RPDs			✓	1	No
Laboratory duplicate RPDs		✓			No
Matrix spike (MS) % recoveries			✓	2	No
Laboratory control spike (LCS) % recoveries			✓	3	No
Surrogate % recoveries		✓			No
Other comments		✓			No

Comments

1. Field inter-laboratory RPDs

Field inter-laboratory RPDs were reported within control limits, with the exception of the following biota samples (higher concentration in **bold**):

- **0990_BIOAFA500_241015** & 0990_QC209_241016 for Perfluorooctane sulfonate (PFOS) (78%)

The elevated RPD suggests that concentrations of PFOS in the primary laboratory batch, ES2434947, may be biased high by up to 78%. However, elevated RPDs are expected between different laboratory methods and in biota due to the heterogeneous distribution of PFAS in the matrix type. As a conservative approach, the higher concentrations have been used for assessment against criteria.

PRINTED COPIES ARE UNCONTROLLED FOR 3 MONTHS FROM 23-MAY-25 AND THEN MUST BE REPRINTED

DATA VALIDATION REPORT; WATER & BIOTA

Lab reference:	ES2434947; RN1449010		

2. Matrix spike (MS) % recoveries

Matrix spike recoveries (where reported) were within control limits, with the following exceptions for the primary biota batch ES2434947;

Sample ID	Analyte	Recovery (%)	Range (%)	Comment
0990_BIOAFA517_241016	Perfluoropropane sulfonic acid (PFPrS)	8.2%	70.0-130%	Recovery less than lower data quality objective
0990_BIOAFA517_241016	Perfluorobutane sulfonic acid (PFBS)	51.1%	72.0-128%	Recovery less than lower data quality objective
0990_BIOAFA517_241016	Perfluorooctane sulfonic acid (PFOS)	Not determined	-	MS recovery not determined, background level greater than or equal to 4x spike level.
0990_BIOAFA517_241016	Perfluoropentanoic acid (PFPeA)	58.(%	69.0-132%	Recovery less than lower data quality objective
0990_BIOAFA517_241016	N-Methyl perfluorooctane sulfonamidoethanol (MeFOSE)	83.2%	84.7-135%	Recovery less than lower data quality objective
0990_BIOAFA502_241016	10:2 Fluorotelomer sulfonic acid (10:2 FTS)	80.6%	93.4-130%	Recovery less than lower data quality objective

Matrix spike recoveries were not determined for PFOS in primary batch ES2434947 for biota samples as background levels were greater than or equal to 4x spike levels. These non-determinations do not reflect method bias and do not affect data interpretation. The accuracy of the data can be assessed as acceptable based on method blanks and surrogate spike recoveries (which were reported at the required frequencies and within control limits, and available matrix spike recoveries for the same analytical method group (which were reported generally within control limits).

The potential exists for concentrations of PFPrS, PFBS, PFPeA, MeFOSE and 10:2 FTS to be bias low for biota samples in this batch. As there are no adopted guideline values for these PFAS compounds, the potential for under reporting is not expected to affect interpretation of the results against selected guidelines. However, this potential for under reporting should be taken into consideration when using the biota concentrations of these analytes quantitatively.

DATA VALIDATION REPORT; WATER & BIOTA

Project Manager:	[redacted]	**Validation by:**	[redacted]
Project number:	60676801	**Date:**	16/12/2024
Site:	0990 – RAAF Tindal		
Matrix:	Water & Biota	**Data Verified by:**	[redacted]
Laboratory:	ALS Sydney; NMI Sydney	**Date:**	17/12/2024
Lab reference:	ES2434947; RN1449010		

3.Laboratory Control Spike (LCS) % recoveries

The following LCS recoveries were outside control limits within primary biota samples in batch ES2434947 and may affect data interpretation:

Analyte	Recovery (%)	Limits (%)	Comment
N-Methyl perfluorooctane sulfonamide (MeFOSA)	109%	88.1-105%	Recovery greater than upper control limit
N-Ethyl perfluorooctane sulfonamide (EtFOSA)	80.5%	81.6-144%	Recovery less than lower control limit
10:2 Fluorotelomer sulfonic acid (10:2 FTS)	81.6%	93.4-130%	Recovery less than lower control limit
10:2 Fluorotelomer sulfonic acid (10:2 FTS)	92.5%	93.4-130%	Recovery less than lower control limit

The LCS recovery for MeFOSA was greater than the upper control limit, therefore the potential exists for concentrations of MeFOSA to be over reported. As there is no adopted guideline value for MeFOSA, the potential for over reporting is not expected to affect interpretation of the results against guidelines. However, this potential for over reporting should be taken into consideration when using the data quantitatively.

The LCS recovery for EtFOSA and 10:2 FTA was less than the lower control limit, therefore the potential exists for concentrations of these analytes to be under reported. As there is no adopted guideline value for these concentrations, the potential for over reporting is not expected to affect interpretation of the results against guidelines. However, this potential for over reporting should be taken into consideration when using the data quantitatively.

*RPDs have only been considered where a concentration is greater than 1 times the LOR.

**Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for LOR multiplier ranges are

30 (1 - 10 x LOR); 30 (10 - 30 x LOR); 30 (> 30 x LOR))

***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories.

Any methods in the row header relate to those used in the primary laboratory

*** STORAGE REQUIREMENTS** Please check box. →
Standard Storage time from receipt of samples.
Waters - 3 weeks
Soils - 2 months

☒ Standard Storage
☐ Extended Storage
Specify Disposal Date:
Note: Extended storage incurs a fee and requires a signed agreement.

*** TURNAROUND** Please check box. →
(Not all tests can be expedited, contact Client Services for more information)

☐ 5+ days (no surcharge)
☐ 3 day (+15%)
☐ 2 day (+30%)
☐ 1 day (+50%)

Comments:

***ANALYSIS REQUIRED**
(NB. ALS Quote No. and/or Analysis Suite Codes must be listed to attract suite/quoted price)
Where Metals are required, specify Total (unfiltered bottle required) or Dissolved (field filtered bottle required).
Tick an X in the boxes below analysis to indicate the parameter listed above to be tested on that sample.

*** STORAGE REQUIREMENTS** Please check box →
Standard Storage time from receipt of samples.
Waters - 3 weeks
Soils - 2 months

☑ Standard Storage
☐ Extended Storage
Specify Disposal Date:
Note: Extended storage incurs a fee and requires a signed agreement.

*** TURNAROUND** Please check box →
(Not all tests can be expedited, contact Client Services for more information)

☑ 5+ days (no surcharge)
☐ 3 day (+15%)
☐ 2 day (+30%)
☐ 1 day (+50%)

***ANALYSIS REQUIRED**
(NB. ALS Quote No. and/or Analysis Suite Codes must be listed to attract suite/quoted price)
Where Metals are required, specify Total (unfiltered bottle required) or Dissolved (field filtered bottle required).
[illegible] an X in the boxes below analysis to indicate the parameter listed above to be tested on that sample.

***ANALYSIS REQUIRED**

(NB. ALS Quote No. and/or Analysis Suite Codes must be listed to attract suite/quoted price)

[redacted]tals are required, specify Total (unfiltered bottle required) or Dissolved (field filtered bottle required).

[redacted]he boxes below analysis to indicate the parameter listed above to be tested on that sample.

*** STORAGE REQUIREMENTS**

Please check box. →

Standard Storage time from receipt of samples:

Waters - 3 weeks
Soils - 2 months

☐ Standard Storage

☐ Extended Storage

Specify Disposal Date:

Note: Extended storage incurs a fee and requires a signed agreement.

*** TURNAROUND**

Please check box. →

(Not all tests can be expedited, contact Client Services for more information)

☑ 5+ days (no surcharge)

☐ 3 day (+15%)

☐ 2 day (+30%)

☐ 1 day (+50%)

Receipt Detail	:	No. of samples received / analysed	: 6 / 6

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **(21/06/2024) This is an updated SRN which reflects a change in project reference and purchase order reference.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **QC Forward analysis will be conducted by NMI.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Order number	: 60612561/2.1	Date Analysis Commenced	: 21-Jun-2024
C-O-C number	: ----	Issue Date	: 25-Jun-2024
Sampler	: [redacted]		
Site	: Katherine		
Quote number	: EN/004/23		
No. of samples received	: 6		
No. of samples analysed	: 6		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	LCMS Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Sampler	: [redacted]	No. of samples received	: 6
Order number	: 60612561/2.1	No. of samples analysed	: 6

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	17	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	17	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2435724**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: [redacted]
Contact	: [redacted]	[redacted]	: [redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 05-Nov-2024
Site	: POT111	Issue Date	: 11-Nov-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*	
Laboratory Duplicates (DUP)							
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	**0.00**	**10.00**	×	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **18/11/2024: This is an updated SRN reflecting a change the sampling date/time for sample ES2435725-001.**
- **Sample 0990_QC200_241030 has been forwarded to ALS Brisbane.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- Amendment (18/11/2024): This report has been amended to change the sampling date/time for sample ES2435725-001. All analysis results are as per the previous report.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **WATER**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2435728**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: [redacted]
Contact	: [redacted]	[redacted]	: [redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 05-Nov-2024
Site	: OTH114	Issue Date	: 11-Nov-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **WATER**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2435729**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: [redacted]
Contact	: [redacted]	[redacted]	[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 05-Nov-2024
Site	: oth115	Issue Date	: 11-Nov-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2435730**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: [redacted]
Contact	: [redacted]	[redacted]	: [redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 05-Nov-2024
Site	: OTH120	Issue Date	: 11-Nov-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Dates

Date Samples Received	: 05-Nov-2024 11:00	Issue Date	: 20-Nov-2024
Client Requested Due Date	: 11-Nov-2024	Scheduled Reporting Date	: **11-Nov-2024**

Delivery Details

Mode of Delivery	: Client Drop Off	Security Seal	: Not Available
No. of coolers/boxes	: 2	Temperature	: 2.8'C - Ice present
Receipt Detail	:	No. of samples received / analysed	: 57 / 57

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **08/11/2024: This is an updated SRN reflecting the removal of the sample description for samples ES2435779-047 - 053.**
- **15/11/2024: This is an updated SRN reflecting the change to the sample IDs for samples ES2435779-002, 003, 004 and 006.**
- **20/11/2024: This is an updated SRN reflecting an update to the sample ID for all ES2435779 samples.**
- **Samples 0990_QC203_20241021, 0990_QC200_20241017, 0990_QC201_20241018 and 0990_QC202_20241019 have been forwarded to ALS Brisbane.**
- **Sample 0990_MW149_202410 was not received/sampled.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **WATER**

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: Surrogates could not be determined due to samples being diluted outside of analytical range
- Amendment (15/11/2024): This report has been amended as a result of a request to change sample identification numbers (IDs) received from [redacted] on 15/11/2024, for samples ES2435779-002, 003, 004 and 006. All analysis results are as per the previous report.
- Amendment (20/11/2024): This report has been amended as a result of a request to change sample identification numbers (IDs) received from [redacted] on 15/11/2024, for all ES2435779 samples. All analysis results are as per the previous report.
- EP231X: Particular samples required dilution due to the presence of high level contaminants. LOR values have been adjusted accordingly.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

C-O-C number	: 73714	Issue Date	: 20-Nov-2024
Sampler	: [redacted]		
Site	: Biannual GW October		
Quote number	: ----		
No. of samples received	: 57		
No. of samples analysed	: 57		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2435779**	Page	: 1 of 13
Amendment	: **2**		
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: [redacted]
Contact	[redacted]	[redacted]	: [redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 05-Nov-2024
Site	: Biannual GW October	Issue Date	: 20-Nov-2024
Sampler	: [redacted]	No. of samples received	: 57
Order number	: 60676801/	No. of samples analysed	: 57

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: PFAS results for sample ES2440429-001 confirmed by re-extraction and re-analysis.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2440429**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: [redacted]
Project	: NT_0990_PFASMGMT_24	Date Samples Received	: 12-Dec-2024
Site	: ----	Issue Date	: 19-Dec-2024
Sampler	: [redacted]	No. of samples received	: 5
Order number	: 60676801/2.b	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	15	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	15	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Receipt Detail	: ESKY LARGE	No. of samples received / analysed	: 1 / 1

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Unless otherwise stated, analytical work for this work order will be conducted by ALS Brisbane, NATA accreditation no. 825, site no. 818.
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **WATER**

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2438420**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: [redacted]
Contact	: [redacted]	[redacted]	: [redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 07-Nov-2024
Site	: QC PP October	Issue Date	: 14-Nov-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	16	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	16	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*	
Laboratory Duplicates (DUP)							
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	16	**0.00**	**10.00**	×	NEPM 2013 B3 & ALS QC Standard
Laboratory Control Samples (LCS)							
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	16	**6.25**	**5.00**	✓	NEPM 2013 B3 & ALS QC Standard
Method Blanks (MB)

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

No. of coolers/boxes	: 1	Temperature	: 12.2°C, 14.5°C, 21.6°C - Ice present
Receipt Detail	: ESKY LARGE	No. of samples received / analysed	: 4 / 4

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Unless otherwise stated, analytical work for this work order will be conducted by ALS Brisbane, NATA accreditation no. 825, site no. 818.
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X PFAS: Sample 0990_QC200_20241017 (EB2438426-002) required dilution due to the presence of high-level contaminants. LOR values have been adjusted accordingly.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2438426**	Page	: 1 of 5
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: [redacted]
Contact	: [redacted]	[redacted]	: [redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 07-Nov-2024
Site	: Biannual GW October	Issue Date	: 14-Nov-2024
Sampler	: [redacted]	No. of samples received	: 4
Order number	: 60676801/	No. of samples analysed	: 4

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- ***Samples were originally received by ALS Sydney on 12/11/2024 and have been forwarded to ALS Brisbane for analysis. Temperature on arrival in ALS Brisbane has been noted above.**
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Unless otherwise stated, analytical work for this work order will be conducted by ALS Brisbane, NATA accreditation no. 825, site no. 818.
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2439270**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: [redacted]
Contact	: [redacted]	[redacted]	: [redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 13-Nov-2024
Site	: Tindal	Issue Date	: 19-Nov-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	10	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	10	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X: Poor matrix spike recoveries due to matrix interferences.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X (Biota): ALS NATA accreditation for PFAS in Biota covers all Perfluoroalkyl Sulfonic Acids, Perfluoroalkyl Carboxylic Acids and (n:2) Fluorotelomer Sulfonic Acids in fish (whole and muscle), plants and vegetable matrices, with the exception PFBA (fish only), EtFOSA, MeFOSE, EtFOSE, MeFOSAA, EtFOSAA.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	[redacted]	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :
Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC
* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **BIOTA**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2434947**	Page	: 1 of 11
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	[redacted]
Contact	: [redacted]	[redacted]	: [redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 25-Oct-2024
Site	: ----	Issue Date	: 21-Nov-2024
Sampler	: [redacted]	No. of samples received	: 56
Order number	: 60676801/7.03.01	No. of samples analysed	: 52

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **Laboratory Control outliers exist - please see following pages for full details.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **BIOTA**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Laboratory Control Spike (LCS) Recoveries							
EP231C: Perfluoroalkyl Sulfonamides	QC-6190515-002	----	**N-Methyl perfluorooctane sulfonamide (MeFOSA)**	31506-32-8	109 %	88.1-105%	**Recovery greater than upper control limit**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **BIOTA**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **BIOTA**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
PFOS - Linear/Branched Speciation	EP231-PFOS-SP	BIOTA	In-house: Linear PFOS is determined by quantiation of the separate linear peak using linear PFOS. Branched PFOS is determined as the difference between total PFOS (determined using a mixed linear/branched standard) and linear PFOS.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	BIOTA	In-house: A sample extract is analysed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of biota which is then solvent extracted. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Prep-Preparation for Biota Analysis	* Biota-PP	BIOTA	A sample is prepared from whole or particular tissues/organs, identified, homogenised and the total weight of prepared sample recorded.
Sample Preparation for PFAS in Biota	EP231-PR	BIOTA	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of homogenised biota which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

N24/022158
PFAS in biota is not NATA accredited.
Internal standard recoveries are outside the acceptable range of 50-150%
due to matrix interference for: PFTeDA, 4:2 FTS

N24/022159
PFAS in biota is not NATA accredited.
Internal standard recoveries are outside the acceptable range of 50-150%
due to matrix interference for: PFTeDA, 4:2 FTS, 6:2 FTS

[redacted]

02-DEC-2024

REPORT OF ANALYSIS

All results are reported on a wet weight basis as received, and are corrected for labelled internal standard recoveries.

PFHxS and PFOS were quantified using combined branched and linear standards, for all PFAS linear and branched isomers in samples are totalled for reporting.

NATA
WORLD RECOGNISED
ACCREDITATION

Accredited for compliance with ISO/IEC 17025 - Testing.
This report shall not be reproduced except in full.
Results relate only to the sample(s) as received and tested.

* Denotes the analyte or test method is not within our ISO/IEC 17025 scope of accreditation.

Measurement Uncertainty is available upon request.
The testing was undertaken at: [redacted]

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **Sample 0990_QC201_241101 has been forwarded to ALS Brisbane.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Any sample identifications that cannot be displayed entirely in the analysis summary table will be listed below.

ES2435723-008 : 01-Nov-2024 14:30 : 0990_QC301_241101 - Rinsate
ES2435723-009 : 01-Nov-2024 14:30 : 0990_QC401_241101 - Field blank

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

No. of samples analysed	: 8		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	: 60676801/	No. of samples analysed	: 8

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	2	38	5.26	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	38	2.63	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Dates

Date Samples Received	: 07-Nov-2024 10:30	Issue Date	: 07-Nov-2024
Client Requested Due Date	: 14-Nov-2024	Scheduled Reporting Date	: **14-Nov-2024**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Intact.
No. of coolers/boxes	: 1	Temperature	: 12.2°C, 14.5°C, 21.6°C - Ice present
Receipt Detail	: ESKY LARGE	No. of samples received / analysed	: 1 / 1

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Unless otherwise stated, analytical work for this work order will be conducted by ALS Brisbane, NATA accreditation no. 825, site no. 818.
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2438417**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: [redacted]
Contact	: [redacted]	[redacted]	: [redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 07-Nov-2024

Sampler	[redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	16	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	16	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]		Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / *Container / Client Sample ID(s)*	*Sample Date*	*Extraction / Preparation*			*Analysis*

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2433850**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: POT129	Issue Date	: 28-Oct-2024

Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: POT127	Issue Date	: 28-Oct-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **WATER**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: OTH118	Issue Date	: 28-Oct-2024
Sampler	: [redacted], [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2435722**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 05-Nov-2024
Site	: POT120	Issue Date	: 10-Nov-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2433848**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: POT128	Issue Date	: 28-Oct-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2433844**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: POT201	Issue Date	: 28-Oct-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Client Requested Due Date	: 28-Oct-2024	Scheduled Reporting Date	: **28-Oct-2024**

Delivery Details

Mode of Delivery	: Client Drop Off	Security Seal	: Not Available
No. of coolers/boxes	: 1	Temperature	: 7.5'C DRW 5.7'C 10.7'C 7.7'C SYD - Ice present
Receipt Detail	:	No. of samples received / analysed	: 1 / 1

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

QUALITY CONTROL REPORT

Work Order	: **ES2433840**	Page	: 1 of 7
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney

No. of samples analysed	: 1		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2433840**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: POT125	Issue Date	: 28-Oct-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2433852**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: POT113	Issue Date	: 28-Oct-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2433847**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: POT126	Issue Date	: 28-Oct-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2433843**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: POT198	Issue Date	: 28-Oct-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

No. of coolers/boxes	: 1	Temperature	: 7.5'C DRW 5.7'C 10.7'C 7.7'C SYD - Ice present
Receipt Detail	:	No. of samples received / analysed	: 1 / 1

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **WATER**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2433839**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: POT124	Issue Date	: 28-Oct-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **QC Forward analysis will be conducted by ALS Brisbane.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

CERTIFICATE OF ANALYSIS

Work Order	: **ES2433855**	Page	: 1 of 9
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	Contact	: [redacted]
[redacted]	: [redacted]	[redacted]	: [redacted]
[redacted]	: ----	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024 11:30
Order number	: 60676801/	Date Analysis Commenced	: 24-Oct-2024
C-O-C number	: 73713	Issue Date	: 28-Oct-2024 11:15
Sampler	: [redacted]		
Site	: October 24 PP QC's		
Quote number	: ----		
No. of samples received	: 9		
No. of samples analysed	: 9		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Analytical Results

Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2433855**	Page	: 1 of 5
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: October 24 PP QC's	Issue Date	: 28-Oct-2024
Sampler	: [redacted]	No. of samples received	: 9
Order number	: 60676801/	No. of samples analysed	: 9

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

No. of coolers/boxes	: 1	Temperature	: 7.5'C DRW 5.7'C 10.7'C 7.7'C SYD - Ice present
Receipt Detail	:	No. of samples received / analysed	: 1 / 1

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2433851**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: POT131	Issue Date	: 28-Oct-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2433846**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: OTH117	Issue Date	: 28-Oct-2024
Sampler	: [redacted], [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	19	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2436471**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	[redacted]	Telephone	: [redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 12-Nov-2024
Site	: Tindal	Issue Date	: 18-Nov-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	6	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	6	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **ES2433838**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Sydney
Contact	: [redacted]	[redacted]	: + [redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 22-Oct-2024
Site	: POT121	Issue Date	: 28-Oct-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Dates						
Date extracted		25-JUN-2024				
Date analysed		25-JUN-2024				

N24/014011
PFOS and PFHxS are quantified using a combined branched and linear standard,
linear and branched isomers are totalled for reporting.
All results corrected for labelled surrogate recoveries.

REPORT OF ANALYSIS

Selected PFAS surrogate recoveries are biased due to matrix effects.ô
Surrogate recoveries low for selected analytes - PFAS LORs not raised since S/N >10.

Luke Baker, Analyst
Organics - NSW
Accreditation No. 198

01-JUL-2024

Accredited for compliance with ISO/IEC 17025 - Testing.
This report shall not be reproduced except in full.
Results relate only to the sample(s) as received and tested.

Measurement Uncertainty is available upon request.

Note: Sampling date(s) have been provided by the client.
The testing was undertaken at: 105 Delhi Road, North Ryde, NSW, 2113

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Unless otherwise stated, analytical work for this work order will be conducted by ALS Brisbane, NATA accreditation no. 825, site no. 818.
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EB2438420**	Page	: 1 of 4
Client	: **AECOM AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Brisbane
Contact	: [redacted]	[redacted]	: +[redacted]
Project	: NT_0990_PFASOMP_24	Date Samples Received	: 07-Nov-2024
Site	: QC PP October	Issue Date	: 14-Nov-2024
Sampler	: [redacted]	No. of samples received	: 1
Order number	: 60676801/	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	16	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	16	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **31/10: SRN has been resent to acknowledge the correction of the project reference from NSW_0356_PFASOMP -23 to NT_0990_PFASOMP_24 as per the COC. For any further information regarding these adjustments please contact client services at** [redacted]
- Discounted Package Prices apply only when specific ALS Group Codes ('W', 'S', 'NT' suites) are referenced on COCs.
- Please direct any turn around / technical queries to the laboratory contact designated above.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Unless otherwise stated, analytical work for this work order will be conducted by ALS Brisbane, NATA accreditation no. 825, site no. 818.
- **Breaches in recommended extraction / analysis holding times (if any) are displayed overleaf in the Proactive Holding Time Report table.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X PFAS: Particular Samples showed matrix interference indicated by internal standard recovery less than 50%. This is deemed acceptable as all associated analytes are less than the limit of reporting.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	14	7.14	10.00	NEPM 2013 B3 & ALS QC Standard

Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	0	14	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	*Method*	*Matrix*	*Method Descriptions*
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	*Method*	*Matrix*	*Method Descriptions*
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

1.0 Introduction

1.1 Preamble

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) in January 2022 to implement the per- and poly-fluoroalkyl substances (PFAS) Management Action Plan (PMAP) (Defence, 2019), for Royal Australian Air Force (RAAF) Base Tindal ('the base'). The PMAP implementation comprises a number of services which will be collectively referred to as the 'project' hereafter.

The location of the base with respect to the nearby township of Katherine, Northern Territory (NT) is shown on **Figure F1 (Appendix A).** The figure also outlines the PFAS management area of the base and Katherine surrounds.

The key objectives of the project (in its entirety) are to:

- Implement practicable solutions to prevent or minimise the migration of PFAS beyond the Defence property boundary by addressing significant source area/pathways on the base
- Ensure the proposed and implemented remedial strategies have measurable and demonstratable results.

The project has been split into five Service Packages, with Service Package 4 Ongoing Monitoring Plan (OMP) Services being relevant to this End of Wet Season 2025 Sampling Event Report (SER). The OMP that guided the sampling program documented in this report was approved in January 2025 (Defence, 2025), which replaced the previously approved OMP (Defence, 2021a).

The primary purpose of the OMP (comprising both dry and wet season sampling) is to monitor changes to the PFAS impact in groundwater and surface water pathways associated with the key sources of PFAS on base, as initially identified and assessed through the detailed site investigation (DSI) phase of works (Coffey, 2018a) (Coffey, 2018b). Changes in PFAS impact may result from the base-specific or cumulative influence of remediation or containment actions, transportation trends, and / or changes to hydrogeology or climatic conditions. Identified changes to PFAS impact originating from the base can inform risk management decisions taken by Defence and Territory agencies to protect human health and the environment. At the end of the 2024-2025 sampling period (Aug 2024 – May 2025), an ongoing monitoring report is to be prepared that assesses the complete data set collected during the discrete monitoring events completed over the 10-month period. This annual assessment will consider environmental variability and statistically significant trends in PFAS concentrations.

The seasonal monitoring program at the base includes a regime of groundwater, surface water and biota sampling to evaluate these changes in the long term, to enable Defence to maintain an up-to-date understanding of temporal and spatial distribution, concentration, and transport of PFAS. The data collection requirements which were adopted for the end of wet season event are documented in the *Sampling Analysis and Quality Plan (SAQP) (Revision 0)* (AECOM, 2025).

Table 1 Sampling schedule with end of wet season sampling highlighted in green

Sampling	Wet Season						Dry Season					
	Early		Mid		Late		Early		Mid		Late	
	Nov-24	Dec-24	Jan-25	Feb-25	Mar-25	Apr-25	May-25	Jun-25	Jul-25	Aug-25	Sep-25	Oct-25

												Annual
				Biannual							Biannual	
Surface Water		Twice in Wet Season			Twice in Wet							
											Annual	
					Biannual						Biannual	
Aquatic Biota											Annual	

1.2 Objectives

The purpose of this SER is to summarise the scope of work, methodology, results and findings from the wet season sampling works conducted between February 2025 and May 2025 in accordance with the SAQP (AECOM, 2025).

This report has been prepared in accordance with the Defence's PFAS OMP Reporting Guidance (Defence, 2024).

An annual ongoing monitoring report (OMR) will be subsequently developed for the purpose of assessing the data collected between August 2024 and May 2025.

2.0 Scope of Work

2.1 Overarching Scope

The groundwater and surface water sampling works described herein were completed in general accordance with the SAQP (AECOM, 2025). Where deviations arose, these are listed with the significance of the consequence described in **Section 2.3** below. Prior to sampling, the SAQP was reviewed to ensure compliance with the following:

- the OMP (Defence, 2025)
- Heads of the Environment Protection Authority (HEPA), PFAS National Environmental Management Plan (NEMP), version 3.0 (HEPA, 2025)
- National Environment Protection (Assessment of Site Contamination) Measure 1999 as amended 2013 (ASC NEPM, 2013)
- Defence Pollution Prevent Manual (Defence, 2017)
- Australian/New Zealand Standard (AS/NZ) 5667:1998 Water quality – Sampling (AS/NZS, 1998)
- Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2018)**.**

The planned scope of work for the end of wet season 2025 monitoring period included:

- Collection of groundwater samples from 18 private bore locations in accordance with the 'monthly in the wet' sampling scope on three occasions in February, March and April 2025.
- Gauging (where possible) and collection of samples from 50 groundwater locations in April and May 2025. These wells are sampled biannually.
- Collection of samples from six surface water locations in March 2025 that are sampled biannually.
- Collection of samples from six 'twice in wet season' surface water locations in April 2025.
- Collection of relevant quality assurance and quality control (QA/QC) samples in accordance with the relevant SAQP at the time of sampling
- Analysis of samples included the 28 analyte PFAS-suite (full suite) at the standard limit of reporting (LOR). Data management of the field and laboratory data in the Defence ESdat database in accordance with Defence's Contamination Management Manual (DCMM), Annex L. (Defence, 2021b).
- Preparation of this SER.

2.2 Monitoring Locations

The monitoring locations outlined within the SAQP (AECOM, 2025) for the end of wet season sampling events are tabulated below. Deviations from the planned sampling are highlighted in **bold** and detailed in **Section 2.3**.

Table 2 'Monthly in wet season' private bore groundwater sampling locations – February 2025, March 2025 and April 2025 (Figure 2 – 7 in Appendix A)

Area	Description	SAQP Locations
Off-Base - Private	Shadforth Road	POT114[1], OTH117[1], POT120, POT130, POT124,
	Zimin Drive	POT112, POT113, POT121[1], POT125, POT126, POT127, POT128, POT129, OTH118, OTH119[1], POT131
	Tokmakoff Road	POT198[1], POT201

	Katherine Hot Springs	SW153*

*Locations that have changed from quarterly sampling frequency to biannual frequency in the most recent OMP (Defence, 2025) and therefore SAQP (AECOM, 2025) revision

Table 5 'Twice in wet season' surface water sampling locations – April 2025 (Figure 11 & 12 Appendix A)

Area	Description	SAQP Locations
On-Base	Tindal Creek	SW016, SW350, SW021 (off Base)
	Runway drain	SW188, SW049
	Drain off Fire Station Handstand	SW140

2.3 Deviations from the SAQP

The 2025 wet season sampling events included some deviations from the SAQP (AECOM, 2025), as outlined in **Table 6.**

Table 6 Deviations from the SAQPs during groundwater and surface water sampling events.

SAQP	Deviation	Impact on OMP
Collection of 50 biannual groundwater samples	Collection of 46 of 50 groundwater samples: • MW117, MW118S and MW119 were unable to be sampled due to root blockages. Field teams partially unblocked the wells, up to 9 metres below ground level (mbgl) using a root clearance tool, however, the blockage was at a deeper depth. Additional lengths of the root clearing tool are required to unblock the wells. • MW131 was unable to be sampled as it has been destroyed during dirt road grading after the wet season regrowth.	MW117 – Potential data gap for PFAS groundwater concentrations on the western boundary track. MW130 (long screened interval like MW117) to the north was able to be sampled, reducing the impact of this data gap (2 km spatial data gap). MW117 and MW130 overlap in screen intervals from 1 to 14.5 metres below ground level (m bgl). MW118S – Moderate data gap for PFAS groundwater concentrations on the western boundary track. Alternative wells listed on the SAQP were also blocked, and there are no other nearby wells screened at similar intervals. MW119 – Moderate data gap for PFAS groundwater concentrations on the western boundary track. Alternative wells listed on the SAQP were also blocked, and there are no other nearby screened wells at similar intervals. MW131 - Moderate data gap for PFAS groundwater concentrations migrating off the base. However, MW133 (long screened interval like MW131) that is further north was accessed and sampled, reducing the impact of this data gap. The SAQP did not have a alternative location listed.
Analysis of all groundwater samples for PFAS full suite standard analysis (LOR is 0.01 µg/L)	All Cossack private property groundwater samples were analysed for PFAS full suite low-level analysis (LOR of 0.002 µg/L) with the exception of the following that consistently report concentrations above the standard LOR: • POT112 • POT113 • POT120 • POT121 A select number of biannual groundwater samples from sentinel wells were analysed for PFAS full suite low-level analysis: • MW133 • MW136	No impact –PFAS low-level analysis provides these groundwater results with a lower detection level to improve understanding of PFAS distribution laterally to the west of Katherine River and within the furthest extents of the management area.

SAQP	Deviation	Impact on OMP
	• MW144 • MW815 • OTH111 • POT111	
Collection of six biannual surface water samples in March 2025	One location was not able to be sampled: • OTH008 was unable to be sampled as the sampling location was not accessible.	OTH008: No impact – the pool is closed whilst undergoing renovations, therefore eliminating potential risk during the closure period.

3.0 Sampling Methodology

3.1 Adopted Methodology

The methodologies adopted for the groundwater and surface water sampling events were in accordance with the SAQP (AECOM, 2025) and noting that deviations are captured in **Section 2.3.**

Table 7 Groundwater and surface water sampling methodology

Item	Details
Groundwater and surface water methodology	
Groundwater gauging	Depth to groundwater (metres below top of casing, mbTOC) was measured from monitoring well locations using a decontaminated oil/water interface probe within as close to 24-hours of each other as possible, prior to HydraSleeve deployment. Groundwater elevations were then determined in metres above the Australian Height Datum (mAHD) and used to infer groundwater flow direction. Groundwater gauging result tables are presented in **Appendix B**
Groundwater sampling	Private property groundwater samples were obtained from extraction bores during the three 'monthly in wet season' events. These samples were collected from existing taps on the headworks of the extraction bore. Samples were collected from the 'first-flush' from the tap. Biannual groundwater samples were collected using the no-purge method of HydraSleeves. The sampling sleeve was deployed after groundwater gauging, within the screened interval and left to rest for a minimum of 24-hours prior to sample collection. Groundwater sampling field result tables are presented in **Appendix B.**
Surface water sampling	Surface water samples were collected from either approximately 0.5 m below the surface, or mid-column for shallow sampling locations, with care taken to minimise collection of sediment or floating materials in the samples. At each location, laboratory supplied bottles were lowered into the water using a decontaminated aluminium sampling pole with the cap immediately applied once the container was full and retrieved from the water. Surface water sampling field result tables are presented in **Appendix B.**
Water quality parameters	Water quality parameters were recorded ex-situ, post-sample collection, using a YSI Pro Water Quality Meter. Water quality measurements recorded consisted of the following: temperature (°C), electrical conductivity (EC), dissolved oxygen (DO), oxidation-reduction potential (reported as redox), and pH. Observations of odour, colour, and clarity (low, moderate or high turbidity) of the samples collected were recorded at each location. Refer to **Appendix C** for sampling logs and **Appendix D** for calibration records of the water quality meter.
QA/QC samples	For water sampling, field QA/QC samples included intra-laboratory duplicate and inter-laboratory duplicate samples collected at a rate of 1 in 10 primary samples, rinsate samples collected at a rate of one per day where decontaminated non-dedicated equipment was used, field blank samples at a rate of one per sampling day and trip blank samples at a rate of one per cooler. Refer to **Section 3.3** for assessment of QA/QC sample data with the data validation report provided in **Appendix E**.
Sample analysis	In accordance with the Data Quality Objectives (DQO) outlined in the SAQP (AECOM, 2025), samples collected were analysed for the extended PFAS suite

Item	Details
	at National Association of Testing Authorities' (NATA) accredited laboratories. Select few peripheral wells were scheduled for PFAS low level analysis to determine any trace concentrations of PFAS on the management area boundary. Primary and intra- laboratory duplicate samples were submitted to the primary laboratory, ALS Environmental Pty Ltd (ALS) Sydney, New South Wales (NSW). Inter-laboratory samples were sent to a secondary laboratory, National Measurement Institute (NMI) Sydney, NSW. Chain of Custody (COC) forms are presented in **Appendix F** and laboratory certificates are presented in **Appendix G.**

3.2 Adopted screening criteria

Screening criteria were selected on the basis of national guidance in the form of the PFAS National Environmental Management Plan, Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance. Guidance documents used to assess the dataset includes the following:

- Department of Health (DoH) Health Based Guidance Values for PFAS for use in site investigations in Australia (Department of Health, 2019)
- Heads of the Environment Protection Authority (HEPA), NEMP version 3.0 (HEPA, 2025)
- National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, (ASC NEPM, 2013)

A summary of screening criteria used for groundwater and surface water matrices are presented in **Table 8**.

Table 8 Summary of adopted screening criteria for groundwater and surface water

Pathway	Compound	Criteria	Comment/reference
Human health receptors			
Drinking water	PFOS+PFHxS	0.07 µg/L	These values are from the PFAS NEMP 3.0 (HEPA, 2025)
	PFOA	0.56 µg/L	
Recreational use	PFOS+PFHxS	2 µg/L	These values are from PFAS NEMP 3.0 (HEPA, 2025)
	PFOA	10 µg/L	
Ecological receptors			
Freshwater - 99% species protection	PFOS	0.00023 µg/L	These values are from the PFAS NEMP 3.0 (HEPA, 2025) *The 99% level of protection has been applied for slightly to moderately disturbed ecosystems. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife. For the purposes of preliminary screening of analytical water results, the laboratory LOR will be adopted rather than sole use of the criteria value.*
	PFOA	19 µg/L	

The drinking water guideline value has been applied to surface water as the town water supply is partially sourced from surface water from the Katherine River, and the interaction between surface and groundwater due to groundwater expressing through springs and surface water infiltrating into groundwater through sinkholes. The recreational water guideline value has also been applied to groundwater due to groundwater expressing through springs and the use of groundwater extraction for irrigation and recreational use such as the filling of private swimming pools and potentially public swimming pools.

Further to the adopted screening criteria, the OMP (Defence, 2025) outlines site-specific trigger points that data are to be reviewed against. The OMP triggers are summarised in **Table 9** with recommended actions (if triggers are met) presented in the OMP (Defence, 2025).

Table 9 OMP Trigger Points

Locations	Trigger Point
Groundwater locations previously below laboratory LOR for PFAS	First time detection of PFAS compounds in groundwater
Groundwater locations within specific management zones	PFAS concentrations in groundwater that reported above the designated management zone criteria or an identified change in the risk profile resulting from the reported concentration.
Private bores in Cossack	Exceedance of PFAS compounds in private property groundwater above the adopted drinking water health-based screening level. Or PFOS+PFHxS and/or sum of PFAS concentrations in the bore show an increasing trend (using trend analysis).
Private bore on Uralla Road (POT111)	Concentrations of PFAS are reported in POT111 which indicate an increase in plume size or concentrations above drinking water guidelines.
Northwestern sentinel well located on Gorge Road east of Katherine River (MW815)	Detectable concentrations of PFAS are reported in MW815.
On-base location (MW133)	Concentrations of PFOS+PFHxS and/or Sum of PFAS concentrations show an increasing trend (using statistical analysis) over two years of monitoring at MW133.
Off-base location on public land (MW136)	Detectable concentrations of PFAS are reported in MW136.
All groundwater and surface water locations	Change of PFAS drinking water guideline values.

3.3 Data quality objectives and data validation

The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2025).

The analytical data can be used as a basis for interpretation, subject to the limitations outlined below.

February 2025 event:

- The potential exists for PFOS to be above the adopted PFAS Freshwater 99% Species Protection guideline (0.00023 µg/L) but below the laboratory LOR (0.01 µg/L) for the following primary samples which should be taken into consideration when interpreting PFOS results against guidelines where results are reported below the LOR:
  - 0990_OTH118_250217
  - 0990_POT114_250217
  - 0990_POT126_250217
  - 0990_POT127_250217
  - 0990_POT128_250217

- 0990_POT130_250217
- 0990_POT131_250217
- 0990_POT198_250217
- 0990_POT201_250217

March 2025 event:

- The potential exists for PFOS to be above the adopted PFAS Freshwater 99% Species Protection guideline (0.00023 µg/L), but below the laboratory LOR (0.01 µg/L) for the following primary samples which should be taken into consideration when interpreting PFOS results against guidelines where results are reported below the LOR:
  - 0990_POT125_250317
  - 0990_POT128_250317
  - 0990_OTH118_250318
  - 0990_POT126_250317
  - 0990_POT127_250318
  - 0990_POT130_250318
  - 0990_POT131_250317
  - 0990_POT198_250318
  - 0990_POT201_250318
  - 0990_SW100_250319
  - 0990_SW108_250319
  - 0990_SW110_250319
  - 0990_SW161_250319

April 2025 event:

- The potential exists for PFOS to be above the adopted PFAS Freshwater 99% Species Protection guideline (0.00023 µg/L), but below the laboratory LOR (0.01 µg/L) for the following primary samples which should be taken into consideration when interpreting PFOS results against guidelines where results are reported below the LOR:
  - 0990_POT125_250414
  - 0990_OTH118_250415
  - 0990_POT126_250414
  - 0990_POT128_250415
  - 0990_POT198_250414
  - 0990_POT127_250415
  - 0990_POT130_250415
  - 0990_POT201_250415
- Elevated RPDs for PFHxS, PFHpS, PFOS and 6:2 FTS in primary batch ES2510860 should be taken into consideration when using the data quantitatively. However, the elevated RPDs are not expected to affect the interpretation against the selected criteria.

April-May 2025 event:

- Elevated RPDs of PFOS and PFOA in both primary lab batches (ES2513390 and ES2513389) should be taken into consideration when using the data quantitatively. However, the elevated RPDs are not expected to affect the interpretation against the selected criteria.

The April-May 2025 biannual GME was completed concurrently with the project's Service Package 2b soil remediation medium term performance monitoring scope of work. The data have been assessed as one single event and therefore some duplicate parent samples may reflect these non-OMP locations.

Data validation procedures employed in the assessment of the field and laboratory QA/QC data are indicative that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report. An examination of sampling analytical data compared to the data validation findings did not result in any results that required flagging for potential inaccuracies.

The full data validation report is provided in **Appendix E.** All data collected during this event has been reviewed and uploaded to the Defence ESdat database in accordance with DCMM (Defence, 2021b) Annex L requirements.

4.0 Results and Discussion

4.1 Groundwater

4.1.1 Groundwater field observations and measurements

Table 10 Groundwater observations and field measurements for February, March, April and May 2025 sampling events

Compound	Criteria
Fieldwork dates	The three 'monthly in wet season' groundwater sampling events were completed on: • 17 to 18 February 2025 • 17 to 18 March 2025 • 14 to 15 April 2025, one location was collected on the 30 April 2025. The biannual groundwater sampling event was completed between 30 April and 8 May 2025 with the resampling of MW815 being completed on the 6 June 2025.
Access and sample collection	**February 2025 event:** All locations for the 'monthly in wet season' groundwater sampling event in February 2025 were accessed and sampled. **March 2025 event:** All locations for the 'monthly in wet season' groundwater sampling event in March 2025 were accessed and sampled. **April 2025 event:** All locations for the 'monthly in wet season' groundwater sampling event in April 2025 were accessed and sampled. **April - May 2025 event:** All locations for the biannual groundwater sampling event in May 2025 were accessed and sampled except for: - MW117, MW118, MW119 which were impacted by roots - MW131 which was destroyed by road dirt track grading.
Groundwater levels	During the biannual sampling event in April and May 2025, groundwater levels were measured from monitoring wells only, as extraction bores do not permit access for groundwater level measurements. Standing water levels ranged from 1.377 mbTOC (MW127) to 17.154 mbTOC (MW135). Groundwater elevations were then calculated using available top of casing elevation data in metres above the Australian Height Datum (mAHD) and ranged from 89.059 mAHD (MW814) to 133.531 mAHD (OTH111). Elevations are presented in **Table T3a** (**Appendix B).** Inferred groundwater flows are from southeast to northwest, towards Katherine Township and River as shown in **Figure F8 (Appendix A**).The recorded groundwater levels collected during the April and May 2025 event were lower than average wet season levels at the respective locations.
Water quality parameters	Water quality parameters were taken during sample collection using a YSI Pro Water Quality Meter. Stabilised readings are presented in **Table T1 and T3b (Appendix B).** **February 2025 event (Private bore monthly in wet season):** • DO ranged from 1.01 mg/L (POT124) to 5.76 mg/L (OTH117) indicating low oxygenated to well oxygenated water conditions.

Compound	Criteria
	• EC ranged from 496 µS/cm (POT131) to 1,052 µS/cm (POT128) indicating freshwater conditions. • pH ranged from 7.32 (OTH119) to 8.0 (POT126, POT127) indicating near neutral conditions. • Redox (corrected) ranged from 276.5 mV (POT128) to 339.7 mV (POT201) indicating moderately reducing conditions. **March 2025 event ('Private bore monthly in wet season'):** • DO ranged from 0.47 mg/L (POT198) to 3.62 mg/L (POT121) indicating low oxygenated to moderately oxygenated water conditions. • EC ranged from 509 µS/cm (POT131) to 993 µS/cm (OTH119) indicating freshwater conditions. • pH ranged from 7.08 (POT112) to 7.59 (POT120) indicating neutral conditions. • Redox (corrected) ranged from 318.0 mV (POT121) to 430.4 mV (POT112) indicating mildly to moderately reducing conditions. **April 2025 event (Private bore monthly in wet season)** • DO ranged from 1.43 mg/L (POT114) to 8.81 mg/L (POT127) indicating low oxygenated to well oxygenated conditions. • EC ranged from 133.6 µS/cm (POT127) to 1,126 µS/cm (OTH119) indicating freshwater conditions. • pH ranged from 5.98 (OTH119) to 8.34 (POT127) indicating slightly acidic to alkaline conditions. • Redox (corrected) ranged from 219.6 mV (POT130) to 298.6 mV (POT120) indicating moderately reducing conditions. • **April-May 2025 event (Biannual groundwater event):** • DO ranged from 0.32 mg/L (MW146) to 7.72 mg/L (POT111) indicating low oxygenated to well oxygenated conditions. • EC ranged from 214.6 µS/cm (MW231) to 1,346 µS/cm (MW803I) indicating freshwater conditions. • pH ranged from 6.08 (MW231) to 8.90 (MW285) indicating neutral to alkaline conditions. • Redox (corrected) ranged from 32.8 mV (MW109) to 397.5 mV (OTH113) indicating mildly to moderately reducing conditions.

4.1.2 Groundwater analytical results

The PFAS groundwater analytical results from the February – May 2025 sampling events are presented in **Table T2 and Table T4 (Appendix B)** and visually presented in **Figures F2 – F10 (Appendix A).**

Analytical results from the biannual and private bore sampling events were consistent with the historical data set, with further discussion of any deviations from the SAQP (AECOM, 2025) that occurred in **Section 2.3**. Locations that met any of the OMP trigger point criteria are shown in **Table 11.**

Table 11 Locations that meet OMP trigger criteria for analytical results

OMP Trigger	Location ID	PFOS+PFHxS concentration (µg/L)
		End of wet season 2025
First time detection of PFAS compounds in groundwater	MW814	0.060 µg/L (May 2025)
	MW815	0.187 µg/L (May 2025)
Exceedance of human health criteria for PFOS+PFHxS in Cossack private property bores	OTH117	0.113 µg/L (February 2025)
	POT113	0.498 µg/L (February 2025)

OMP Trigger	Location ID	PFOS+PFHxS concentration (µg/L)
		End of wet season 2025
		0.380 µg/L (March 2025) 1.630 µg/L (April 2025)

MW814 and MW815 were installed in November 2024 to replace inaccessible private property locations POT122 and POT119 respectively. Therefore, the April-May 2025 biannual event was the first time that these monitoring wells were sampled. Results from MW814 are consistent with results from nearby POT122 that is no longer accessible. Whereas MW815 results are not consistent with POT119 results that have consistently reported below the LOR historically.

OTH117 and POT113 have historically reported concentrations of PFOS+PFHxS above the drinking water criteria. Property owners have been informed of the human health risks associated with utilising their bore water for potable use. Provision of alternative water supply has been provided at these properties.

Monitoring locations with reported PFOS+PFHxS concentrations above their assigned PMAP (Defence, 2019) designated management zone concentration ranges for groundwater are presented in **Table 12**. The management zone ranges are shown in **Figure F1 (Appendix A).**

Table 12 Locations reported PFOS+PFHxS concentrations above the PMAP designated management zones

Assigned Zone	Private Property Event February 2025	Private Property Event March 2025	Private Property Event April 2025	Biannual Event April-May 2025
1 – Groundwater > Recreation Water Criteria (2 µg/L)	Nil	Nil	Nil	Nil
