Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Organic Chemist	[redacted]

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALN. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DKP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Npike (LCN) Report; Recovery and Acceptance Limits
- Matrix Npike (MN) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Nenior Urganic Chemist	[redacted]

General Comments

The analytical procedures used by ALN have been developed from established internationally recognised procedures such as those published by the KNEPA, APHA, AN and 3 EPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LUR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LUR of a reported result differs from standard LUR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Sey : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAN 3 umber = CAN registry number from database maintained by Chemical Abstracts Nervices. The Chemical Abstracts Nervice is a division of the American Chemical Nociety.
LUR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALN Method QWI-E3/48 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LUR: 3 o Limit; Result between 10 and 20 times LUR: 0% - 50%; Result > 20 times LUR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Nample (LCN) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCN.

Matrix Spike (MS) Report

The quality control term Matrix Npike (MN) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Ntatic Recovery Limits as per laboratory Data Quality Ubjectives (DQUs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 127ml bottles have been tested in accordance with the QSM7.3 compliant, NATA accredited method. 60mL or 270mL bottles have been tested to the legacy QSM 7.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 70-170% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 7.3 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

T- is rehort suhersedes any hrevious rehort(s) wit- t- is reference. Results ahhly to t- e samhle(s) as submitted, unless t- e samhling was conducted by ALN. T- is document s- all not be rehroduced, exceht in full.

T- is Quality Control Rehort contains t- e following information:

- Laboratory Duhlicate (DKP) Rehort; Relative Percentage Difference (RPD) and Accehtance Limits
- Met- od Blank (MB) and Laboratory Control Nhike (LCN) Rehort; Recovery and Accehtance Limits
- Matrix Nhike (MN) Rehort; Recovery and Accehtance Limits

Signatories

T- is document - as been electronically signed by t- e aut- orized signatories below. Electronic signing is carried out in comhliance wit- hrocedures shecified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Nenior Urganic C- emist	[redacted]

General Comments

T- e analytical hrocedures used by ALN - ave been develohed from establis- ed internationally recognised hrocedures suc- as t- ose hublis- ed by t- e KNEPA, APHA, AN and 3 EPM. In - ouse develohed hrocedures are fully validated and are often at t- e client request.

W- ere moisture determination - as been herformed, results are rehorted on a dry weig- t basis.

W- ere a rehorted less t- an (<) result is - ig- er t- an t- e LUR, t- is may be due to hrimary samhle extract/digestate dilution and/or insufficient samhle for analysis. W- ere t- e LUR of a rehorted result differs from standard LUR, t- is may be due to - ig- moisture content, insufficient samhle (reduced weig- t emhloyed) or matrix interference.

Sey : Anonymous = Refers to samhles w- ic- are not shecifically hart of t- is work order but formed hart of t- e QC hrocess lot
CAN 3 umber = CAN registry number from database maintained by C- emical Abstracts Nervices. T- e C- emical Abstracts Nervice is a division of t- e American C- emical Nociety.
LUR = Limit of rehorting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

T- e quality control term Laboratory Duhlicate refers to a randomly selected intralaboratory shlit. Laboratory duhlicates hrovide information regarding met- od hrecision and samhle - eterogeneity. T- e hermitted ranges for t- e Relative Percent Deviation (RPD) of Laboratory Duhlicates are shecified in ALN Met- od QWI -E3 /48 and are dehendent on t- e magnitude of results in comharison to t- e level of rehorting: Result < 10 times LUR: 3 o Limit; Result between 10 and 20 times LUR: 0% - 50%; Result > 20 times LUR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

T- e quality control term Met- od / Laboratory Blank refers to an analyte free matrix to w- ic- all reagents are added in t- e same volumes or hrohortions as used in standard samhle hreharation. T- e hurhose of t- is QC harameter is to monitor hotential laboratory contamination. T- e quality control term Laboratory Control Namhle (LCN) refers to a certified reference material, or a known interference free matrix shiked wit- target analytes. T- e hurhose of t- is QC harameter is to monitor met- od hrecision and accuracy indehendent of samhle matrix. Dynamic Recovery Limits are based on statistical evaluation of hrocessed LCN.

Matrix Spike (MS) Report

T-e quality control term Matrix Nhike (MN) refers to an intralaboratory shlit samhle shiked wit- a rehresentative set of target analytes. T-e hurhose of t-is QC harameter is to monitor hotential matrix effects on analyte recoveries. Ntatic Recovery Limits as her laboratory Data Quality Ubjectives (DQUs). Ideal recovery ranges stated may be waived in t-e event of samhle matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2208649**	Page	: 1 of 4
Client	: **DONT NOT USE - LOG UNDER MWHAUS**	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Telephone	: [redacted]
Project	: VIC_0445_PFASOMP	Date Samples Received	: 12-May-2022
Site	: 0445_Bandiana Base	Issue Date	: 18-May-2022
Sampler	: [redacted]	No. of samples received	: 3
Order number	: -	No. of samples analysed	: 2

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count QC	Count Regular	Rate (%) Actual	Rate (%) Expected	Quality Control Specification
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	1	19	5.26	10.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✗	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Per- and Polyfluoroalkyl Substances (PFASs)			
Perfluoroalkyl carboxylic acids (PFCAs)	Melbourne	May 10, 2022	28 Days
- Method: LTM-ORG-2100 Per- and Polyfluoroalkyl Substances (PFAS)			
Perfluoroalkyl sulfonamido substances	Melbourne	May 10, 2022	28 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
% Moisture	Melbourne	May 09, 2022	14 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Method Blank

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

F3.01 Equipment Calibration Report
YSI ProPlus Water Quality Meter

This YSI ProPlus Water Quality Meter has been performance checked as per the manufacturer's guidelines[1].

Unit Type: YSI ProPlus
Serial Number: 19H102165 MWQ 258-1

The unit has been checked for and comprises of the following items:

Item	Present	Damaged or Absent?
Carry case	✓	☐
Attached sensors (x4)	✓	☐
Spare Batteries	✓	☐
Connector Cable	✓	☐
Instruction Manual	✓	☐

The following tests and operational checks have been conducted on the unit:

Item	Test Completed	Test Passed
WQM unit electrodes cleaned and checked	✓	☐
Operations check (screen functions)	✓	☐
Temperature check	✓	☐

Calibration:

Sensor	Cal. Solution	Value	Reading
pH	pH: Buffer Solution 4.00	4.00	3.93
pH	pH: Buffer Solution 7.00	7.00	6.96
pH	pH: Buffer Solution 10.00	10.00	NA
Redox	Standard ORP solution	240 mV @ 9 °c	252 mV @ 9 °c
O_2	Ambient Air for 100% Dissolved Oxygen	100%	102.9
O_2	Sodium Sulphite for 0% Dissolved Oxygen	0%	
Conductivity	Standard Conductivity Solution	12.88 µS/cm @ 9 °c	13.58 mV @ 9 °c

Location ID	Property	Easting	Northing	Monitoring Date	Other Observations
SD323	On-base	491860.00	6000478.00	4/05/2022	High turbidity, brown murky water in pond, surrounded by soil mounds. No oily sheen or frothing, slight bioorganic odour. Reeds and leaf litter on soil mounds, organic matter and debris within and floating atop water
SD346	On-base	492606.00	6000048.00	9/05/2022	Brown, floating sediment, insect larva, sheen on surface, sampled near culvert leading from base
SD355	On-base	492997.00	5999947.00	4/05/2022	Water is cloudy, stagnant flow, in pond surrounded by long reeds. Little surface debris. No sheen, frothing or odour
SD375	On-base	494650.00	6000239.00	5/05/2022	Cloudy shallow water in gully overgrown by tall reeds. Leaf litter and organic matter throughout water body, few signs of bio organisms. No sheen, frothing or odour. Largely undisturbed with stagnant flow.
SD382	On-base	495424.00	6000092.00	3/05/2022	Slightly cloudy water with green grey tinge, reeds in pond with small sapling trees around edge, no film on water, water stagnant
SD395	Off-base	496191.00	5999895.00	9/05/2022	Sediment floating in water, reeds, minor red algae and gree
SD396	Off-base	-	-	3/05/2022	Red algae growing covering water, stagnant, NO, no film near entrance of water trickling in from embarkment, sediment in water
SD397	Off-base	-	-	3/05/2022	brown, sediment in water, algae and reeds growing, NO, NO film
SD400	Off-base	-	-	3/05/2022	Stagnant water, red lilly vegetation covering surface, brown murky, high turbidity, wetland environment, felled trees and stumps in water, cattle grazing along anf within shallow deths of water body, sample taken 2m from water edge
SD412	Off-base	495462.23	6001117.47	9/05/2022	Minor sediment, light orange, water stagnant, sampled ear roots of large tree, organic matter in water
SD424	Off-base	491511.00	6000639.00	4/05/2022	Water was cloudy with algae on concrete surfacss beneath water level towards concrete pipe entrance.Water flow was stagnant in pooling area before pipelines, and increased moving through pipes at 0.5m/s. No sheen or odour.
SD463	Off-base	491216.27	6000546.54	9/05/2022	Sediment floating, insect larva in water, stagnant, NONS, near culvert

DATA QUALITY REVIEW

Data Quality Review
Bandiana Military Area, VIC

This Appendix reviews the Quality Assurance (QA) and Quality Control (QC) documentation. Quality assurance encompasses the actions, procedures, checks and decisions undertaken to ensure sample integrity and representativeness, and the reliability and accuracy of analysis results. The QA documentation should also include an indication of the Data Quality Objectives sought in relation to each significant action, test or process involved in the Assessment.

QC activities measure the effectiveness of the QA procedures by undertaking testing, and then comparing results to previously established objectives. QC work will include the internal laboratory testing as well as results of QC samples submitted such as trip blanks and duplicates. The quality of the information and/or data is deemed satisfactory when the QC results demonstrate that agreed objectives have been met.

Cardno undertook a review of its QA/QC as part of the data validation exercise. The findings are summarised below.

QA/QC Aspects	Evidence and Evaluation
	QA Documentation
Sampling and Analysis Quality Plan and Data Quality Objectives	Cardno was engaged by Department of Defence (the client) to carry out the PFAS Ongoing Monitoring Plan (OMP) at Bandiana Military Area (the Site). The monitoring event commenced on 2 May and concluded 9 May 2022, and is in general accordance with the scope and limitations presented in Cardno's Sampling and Analysis Quality Plan (SAQP) of 13 May 2022 (Our Ref: OMP002_Bandiana_ SAQP_Rev1.2). The assessment was carried out in general compliance with the following: ▪ Australian Standard AS 4482-2005 Guide to the investigation and sampling of sites with potentially contaminated soils, Part 1 - Non-volatile and semi-volatile compounds. ▪ Department of Defence (2019), Contamination Management Manual (DCMM), August 2019. ▪ Department of Defence (2019), Pollution Prevention Guideline - Routine Water Quality Monitoring, Department of Defence, Department of Energy, 2018, Quality System Manual Schedule B15. ▪ EPA Victoria (2009), Industrial Waste Resources Guidelines, Sampling and Analysis of Waters, Wastewaters, Soils and Wastes, Publication 701. ▪ Heads of Environmental Protection Authority's Australia and New Zealand (HEPA) (2020), PFAS National Environmental Management Plan (NEMP) Version 2.0, January 2020. ▪ National Environment Protection Council (NEPC), 1999, National Environmental Protection (Assessment of Site Contamination) Measure (as amended 2013) (ASC NEPM). ▪ National Health and Medical Research Council (NHMRC) (2019), Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water, August 2019. ▪ USEPA (2000), Guidance for the Data Quality Objectives Process (EPA QA/G-4). A quality control program was implemented during the investigation and the quality assurance procedures used have been reiterated in the report.

QA/QC Aspects	Evidence and Evaluation
	The investigation was carried out in accordance with the Safe Work method Statements (SWMS) and Health, Safety and Environment Plan (HSEP) for the Site. Detailed work plans were also provided and are outlined in the SAQP. The Data Quality Objectives were expressed in terms of the purpose of the assessment and the relevant assessment criteria.
Data Validation Report	This review constitutes a data validation review. This was supported by an Esdat generated "QAQC Checker" excel report, summarised in Tables B3 and B4, Appendix B.
Data Representativeness	
Holding Times	Groundwater and surface water sample analysis holding times were in conformance with EPA Publication IWRG701 2009 *'Sampling and Analysis of Waters, Wastewaters, Soils and Wastes*.
Background Samples	No background samples were collected as part of this assessment.
Equipment Decontamination	The decontamination methodology conducted during this investigation is documented in the body of the report, and was in general conformance with the SAQP and work plans. ▪ Reusable sampling equipment was rinsed with Liquinox® and deionised water prior to the collection of each sample.
Data Precision and Accuracy	
QC Testing – Blind Replicates (Primary Lab)	***Groundwater*** ▪ Acceptance Criteria: RPD < 30% ▪ Groundwater Samples Analysed: 32 ▪ Blind Replicate Samples Analysed (ALS duplicates): 4 ▪ Blind Replicate Analyte Pairs: 112 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 1 ▪ Percentage of Analyte Pairs Exceeding Criteria: 0.89% RPD exceedances were associated with PFAS compounds. Analyte concentrations from the primary sample and their corresponding blind replicate sample pairs were all within one order of magnitude. The majority of PFAS RPD exceedances are likely attributed to low concentrations of analyte pairs. This is not considered to impact the results of the investigation. The RPD results are presented in Table B4, Appendix B. ***Surface water*** ▪ Acceptance Criteria: RPD < 30 % ▪ Surface water Samples Analysed: 43 ▪ Blind Replicate Samples Analysed: 4 ▪ Blind Replicate Analyte Pairs: 112 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 12 ▪ Percentage of Analyte Pairs Exceeding Criteria: 10.7% RPD exceedances were associated with PFAS compounds. Analyte concentrations from the primary sample and their corresponding blind replicate sample pairs were all within one order of magnitude. The majority of PFAS RPD exceedances are likely attributed to low concentrations of analyte pairs. This is not considered to impact the results of the investigation. The RPD results are presented in Table B4, Appendix B. ***Sediment*** ▪ Acceptance Criteria: RPD < 30% ▪ Sediment Samples Analysed: 12 ▪ Blind Replicate Samples Analysed (ALS duplicates): 2 ▪ Blind Replicate Analyte Pairs: 56 (excludes 'analytes' that are a summation of other analytes)

QA/QC Aspects	Evidence and Evaluation
	▪ Number of Analyte Pairs Exceeding Criteria: 2 ▪ Percentage of Analyte Pairs Exceeding Criteria: 3.5% RPD exceedances were associated with PFAS compounds. The PFAS RPD exceedances are generally attributed to low concentrations of analyte pairs and sample matrix heterogeneity. This is not considered to impact the results of the investigation. The RPD results are presented in Table B4, Appendix B.
QC Testing – Field Splits (Secondary Lab)	***Groundwater*** ▪ Acceptance Criteria: RPD < 30% ▪ Groundwater Samples Analysed: 32 ▪ Blind Replicate Samples Analysed: 4 ▪ Blind Replicate Analyte Pairs: 112 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 6 ▪ Percentage of Analyte Pairs Exceeding Criteria: 5.3% RPD exceedances were associated with PFAS compounds. The majority of PFAS RPD exceedances are likely attributed to low concentrations of analyte pairs. A number of RPD exceedances may also be attributed to interlaboratory differences, which can be common and significant, based on a study done by the Queensland Department of Environment and Science and the Victorian Environment Protection Authority (Vardy et al, 2018). Overall, these RPD exceedances are not considered to impact the results of the investigation. The RPD results are presented in Table B4, Appendix B. ***Surface water*** ▪ Acceptance Criteria: RPD < 30 % ▪ Surface water Samples Analysed: 43 ▪ Blind Replicate Samples Analysed: 4 ▪ Blind Replicate Analyte Pairs: 112 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 8 ▪ Percentage of Analyte Pairs Exceeding Criteria: 7.1% RPD exceedances were associated with PFAS compounds. The majority of PFAS RPD exceedances are likely attributed to low concentrations of analyte pairs. A number of RPD exceedances may also be attributed to interlaboratory differences, which can be common and significant, based on a study done by the Queensland Department of Environment and Science and the Victorian Environment Protection Authority (Vardy et al, 2018). Overall, these RPD exceedances are not considered to impact the results of the investigation. The RPD results are presented in Table B4, Appendix B. ***Sediment*** ▪ Acceptance Criteria: RPD < 30% ▪ Sediment Samples Analysed: 12 ▪ Blind Replicate Samples Analysed: 2 ▪ Blind Replicate Analyte Pairs: 56 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 1 ▪ Percentage of Analyte Pairs Exceeding Criteria: 1.7% RPD exceedances were associated with PFAS compounds. The majority of PFAS RPD exceedances are likely attributed to low concentrations of analyte pairs and sample matrix heterogeneity. A number of RPD exceedances may also be attributed to interlaboratory differences, which can be common and significant, based on a study done by the Queensland Department of Environment and Science and the Victorian Environment Protection Authority (Vardy et al, 2018). Overall, these RPD exceedances are not considered to impact the results of the investigation. The RPD results are presented in Table B4, Appendix B.

QA/QC Aspects	Evidence and Evaluation
Trip Blanks	One (1) trip blank was collected, and laboratory tested for PFAS. All analytes were reported below the limit of reporting (LOR). Trip blank results are presented in Table B5, Appendix B.
Laboratory Internal QC	Evidence of the laboratories internal QC testing is present and complete. Both ALS (the primary laboratory) and Eurofins-mgt performed internal QC with adequate testing and mostly satisfactory results for matrix spikes, method blanks and laboratory duplicates. Exceptions include: Reports EM2208381, EM2208122 Matrix Spike EM2208381—011 did not determine a matrix spike recovery as the background level was in excess of spike level for select PFAS compounds. Matrix Spike EM2208122—004 did not determine a matrix spike recovery as the Recovery less than lower data quality objective for select PFAS compounds.
Laboratory Method Detection Limit	Laboratory reports indicate the method detection limits were lower than the respective assessment criteria.
NATA endorsement of laboratory reports	Laboratory reports were stamped with the NATA endorsement stamp and signature. Laboratory reports are included in Appendix C of this report.
Calibration of Field Equipment	All field equipment used was calibrated by the equipment supplier. Certificates and daily bump test records are included in Appendix D of this report.
Decontamination and Equipment Blanks	Five (5) rinsate blanks were collected during the investigation. Rinsate blank samples were tested for PFAS which all reported a concentration below the laboratory LOR. Results are shown in Table B5, Appendix B.
Data Comparability	
Full Review of Data	Once all results have been received, Cardno undertook a full review of the data for any anomalies in consideration of historical data at each location (where available), such as first-time detections or exceedances being reported at locations which have not had detections or exceedances previously. Where potentially anomalous data is identified or suspected, further confirmatory measures were undertaken such as re-extraction and reanalysis of the sample by the laboratory and/or additional data quality review. The following samples were reanalysed: QC104, SW326, and SW471. All original results were confirmed.
Standard Procedures	Fieldwork procedures are detailed in the report and followed the work methods outlined in the SAQP.
Qualified Personnel	Staff involved in managing and reviewing the project and those involved in fieldwork are qualified personnel.
Sample Integrity	Field Chain of Custody forms are included in Appendix C of this report and demonstrate sample integrity.
Data Completeness	
Completeness of Test Program	The scope of work undertaken was generally consistent with that set out in the SAQP. Variations to the SAQP are detailed in the Factual Report.
Validity of Data Set	The data quality review indicates no significant systematic errors in the data collection process for surface water and groundwater and therefore, the data set used as the basis for the assessment is considered valid and complete.

APPENDIX

F

INFORMATION ABOUT ENVIRONMENTAL REPORTS

About Site Environmental Assessment Reports

1. Introduction

This document explains the Environmental Site Assessment (ESA) process and the context that applies to the use of Environmental Reports issued by Cardno.

2. What is an ESA?

Environmental Site Assessments (ESA) are undertaken for a range of purposes, specific to the brief issued by the client in each case. The scope may include one or a combination of any of the following:

- A factual report of the condition of a portion of the site or one aspect of an entire site.
- Assessment of the contamination levels in soil to be removed from a site – a waste classification assessment.
- Validation of the success of remediation of a site or a portion of a site.
- Provision of a professional opinion about the suitability of a site for one or more uses, in terms of its contamination status.

The scope of any ESA needs to be defined at the outset.

An ESA is not an Environmental Audit. Such audits are undertaken in accordance with the provisions of regulations enacted in various states of Australia, and are referred to as Site Audits in some jurisdictions. Statutory audits provide certification by EPA accredited auditors that a site is suitable for one or more uses. An ESA may provide similar advice but cannot be used in place of an audit if the latter is required by regulation in any instance. However in some circumstances and jurisdictions an ESA is sufficient to provide "environmental sign-off" of a site.

An ESA may be undertaken for due diligence purposes, to establish whether the site has been impacted to the extent that some beneficial uses of the site may be precluded. Due diligence audits in many cases may be completed as non-statutory Audits, although in some jurisdictions they can also be statutory audits, if defined as such at the outset.

3. The ESA Process

The Client generally initiates the ESA process by specifying a brief which identifies the specific objectives of the assessment. If not, it is the consultants' duty to so specify the ESA

In the case of an ESA to provide an opinion about the suitability of the site for use, it would be conducted in accordance with NEPM (Site Assessment). Such ESA would not commence until a thorough site history assessment (Phase 1 Assessment: to identify the potential for significant contamination at a site) is conducted. However, where the history is unclear, a broad screening of chemical parameters can be used to test environmental media. This normally includes a broad range of organic and inorganic compounds and elements, often referred to as an Environmental Screen.

(In the case of an ESA for a purpose other than to provide an opinion about the suitability of the site for use, it is not always necessary to undertake a Phase 1 assessment.)

The ESA requires sampling of soil at representative locations across the site. A NATA accredited laboratory performs the analysis of soil. It is impractical for all of the soil to be assessed. The ESA is often based on a statistical method of grid or random sampling, augmented by targeted sampling at locations known or suspected to be contaminated. Guidance on sampling strategy and density is provided in Australian Standard AS4482.1–2005. However, some considerable degree of judgement is still required in the application of any sampling and testing strategy. For example the blanket application of the "hot spot" method presented in this standard is often inappropriate given its limitations.

The field program also investigates the likelihood of contamination below the site surface. Field investigations must sample and test fill as well as the natural soils. If contamination is found then it is common for further work to be undertaken to characterise, to the extent practical, its vertical and horizontal extent. However, where fill is encountered and testing shows it to be uncontaminated, it must be realised that the heterogeneous nature of the material might mean that not all pockets of contaminated material can be detected using normal sampling regimes.

EPA guidelines for auditors, that may be relevant for an ESA, indicate the need in all cases to consider the potential for groundwater contamination in any site. This does not mean all sites need to be drilled to sample groundwater, but it is most often the case. Most hydrogeological settings and groundwater conditions are complex and vary in space and time. The condition of groundwater is investigated to identify if any beneficial use or environmental value of groundwater is precluded due to contamination.

As previously stated for soil, all groundwater at the site cannot be tested. The environmental investigations are conducted in accordance with industry standards and guidelines (e.g. EPA Vic Pub 668). This provides a level of confidence that a sufficiently comprehensive assessment of the groundwater at the site is achieved.

Where an investigation shows that groundwater is polluted, consideration should be given to assessing the risks and the need for and practicality of any clean up.

4. Environmental Assessment Report

The ESA Report details the findings of the ESA. It provides summary information on the site definition, the reasons for the assessment and other relevant facts. It reviews the scope and quality of the site investigations, laboratory testing and data analyses undertaken. These reports also present a review of the contamination status of the site, the need for any further clean up, and an opinion on the suitability of the site for a range of beneficial uses and land uses such as “residential – low density”, “commercial” etc, as appropriate.

However, as noted above, some ESA have a narrow scope such as for classification of waste soil for removal from site, and do not make conclusions on suitability of site for use.

The ESA Report generally includes copies of other documents and reports, necessary to support the assessment findings, presented as appendices. These can contain more detailed information than the body of the ESA Report. Care should be taken to also read the appended documents and the ESA report in full.

Cardno generally issues reports in electronic form (e-Report) on CD ROM. ESA Reports are issued in this format as Adobe Acrobat™ PDF files. However, a paper copy of the executive summary of the ESA Report is generally issued to the client, and others as required by the brief or by regulation.

5. Limitations of Environmental Assessment Report

The ESA Report is prepared in a manner that can be easily read by a lay person with a legitimate interest in the contamination status of the site, such as the site owner or occupier, EPA and Local Planning Authority. The ESA report is not intended for use by other parties or for other purposes. Anyone who uses the assessment report for purposes other than specified in the report, does so at their own risk.

The site should only be used for one or more of the beneficial uses and land uses identified in the ESA as suitable.

The conditions and qualifications may apply to the suitability of the site for use, and it is the responsibility of the Client to be cognizant of and accept these in accepting the report. Cardno are only responsible for the issuing of the ESA report but accepts no liability for the costs incurred in the implementation of ESA findings.

The ESA provides a “snapshot” of the site conditions at the time of the site investigation. Consequently, the report may not be valid at a later time if there has been any change to the contamination status of the site in that time. Verification of the status of the site may be required in cases where a significant time has elapsed, or site conditions have changed since the assessment and audit.

The ESA is necessarily limited by constraints such as time, cost and available information; although normal professional practice at the time has been applied with all due care to prepare the report. A necessary requirement of this process is the horizontal and vertical interpolation of data from discrete locations. However, site conditions are generally not homogenous and some discrepancies will occur between the actual and predicted results at locations not directly sampled. There is a risk that contamination may occur at the site and not be identified by a competent investigation and assessment. The approach adopted in sampling (a combination of statistically based grid and judgmental sampling) seeks to reduce, but cannot eliminate, this risk.

Where unexpected occurrences of contamination arise, subsequent to the issue of the ESA Report, Cardno should be permitted to make an interpretation of these facts in relation to the ESA Report findings. Consequently, the Client should inform Cardno and seek their opinion. Cardno accepts no liability for costs incurred due to such

unexpected occurrences, given the inherent uncertainties in the assessment process.

Cardno uses information provided by other parties as the basis for the ESA, and reliance on this information is at the discretion of Cardno. However, however Cardno cannot guarantee any of the facts, findings or conclusions presented by other parties. Cardno will not be liable for the use of information, provided by others that is subsequently found to be intentionally misleading.

The ESA Report is not and does not purport to be anything other than a contaminated land ESA. It is not a geotechnical report and bore logs reproduced are for interpretation of the likely distribution of contamination. They are not intended for geotechnical interpretations and may not be adequate for this purpose.

The ESA Report is not intended to be a comprehensive analysis of the presence and associated risk of asbestos in buildings and services. Where asbestos in buildings and services is known or likely, the report may only caution that an appropriately qualified person be engaged to undertake demolition to avoid contamination of the site.

ppm	Parts per Million
µg/L	Micrograms per Litre
µS/cm	Micro Siemens per Centimetre (Electrical Conductivity - Water)

Site Specific

OMP	Ongoing Monitoring Plan
DCMM	Defence Contamination Management Manual
ESdat	Environmental data management software

1 Introduction

1.1 Background

Cardno was engaged by the Department of Defence ("Defence" or "the Client") to carry out the Per- and Poly-Fluoroalkyl Substances (PFAS) Ongoing Monitoring Plan (OMP) at Bandiana Military Area ("the Site"). The Bandiana Military Area (BMA) is comprised of three individual properties identified as North Bandiana (Gaza Ridge Barracks), South Bandiana (Gaza Ridge Barracks) and East Bandiana (Wadsworth Barracks).

The OMP was carried out in general accordance with the scope and limitations presented in Cardno's Sampling and Analysis Quality Plan (SAQP):

> Cardno, 20 October 2022 Reference: DEF19008_OMP002, '*PFAS Ongoing Monitoring Plan Sampling and Analysis Quality Plan (SAQP) Bandiana Military Area'*, Rev 1.3.

For the purposes of this report:

> The "On-Site Monitoring Area" (the 'Site') is defined as BMA and is comprised of three individual properties identified as North Bandiana (Gaza Ridge Barracks), South Bandiana (Gaza Ridge Barracks) and East Bandiana (Wadsworth Barracks).

> The "Off-Site Monitoring Area" is defined as comprising Jack in the Box Creek to the north west of South Bandiana to its confluence with Wodonga Creek, an unnamed creek to the east of North Bandiana to its confluence with the Kiewa River, and the Kiewa River and western Kiewa River floodplain from Middle Creek in the south to north of the unnamed creek.

> The "Management Area" (MA) is defined as comprising the On-Site Monitoring Area and the Off-Site Monitoring Area.

The location of the Site (BMA), MA, the On-Site Monitoring Area and the Off-Site Monitoring Area are displayed in Figure 1 of Appendix A.

1.2 Purpose & Objectives

The objective of the OMP is to assess the changes in the nature and extent of PFAS within the environment, specifically where there is an identified potentially elevated risk to a receptor or a potential future risk to a receptor associated with Defence's historical use of Aqueous Film Forming Foam (AFFF).

The purpose of this PFAS OMP factual report is to provide an up-to-date status of the condition of the Site as it is currently understood in relation to the most recent sampling event.

The objectives of the report are:

> To provide a succinct summary of the October/November 2022 sampling event and provision of analytical results with supporting tables and figures.

> To provide confirmation of the current understanding of risk.

> To provide supporting data for the assessment of management actions, where relevant.

1.3 Relevant Guidelines

This assessment has been undertaken in general accordance with applicable industry standards for a site investigation for the purpose, objectives and scope identified in this report. These standards are set out in:

> Australian and New Zealand Guidelines, 2018, *Australian and New Zealand Guidelines for Fresh and Marine Water Quality.*

> Australian Standard AS 4482-2005 *Guide to the investigation and sampling of sites with potentially contaminated soils, Part 1 - Non-volatile and semi-volatile compounds*.

> Department of Defence, Department of Energy, 2018, *Quality System Manual Schedule B15*.

> Heads of Environmental Protection Authority's Australia and New Zealand (HEPA), 2020, *PFAS National Environmental Management Plan (NEMP),* Version 2.0, January 2020.

> National Environment Protection Council (NEPC), 1999, *National Environmental Protection (Assessment of Site Contamination) Measure (as amended 2013)* (ASC NEPM).

> National Health and Medical Research Council (NHMRC), 2019, *Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water*.

> Standards Australia, 1998, AS/NZ 5667:1998 *Water Quality – Sampling, Part 1: Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples*.

> U.S. Environmental Protection Agency (EPA), 2006, '*Guidance for the Data Quality Objectives Process (EPA QA/G-4)*'.

> USEPA, 2002, '*Guidance on Environmental Data Verification and Data Validation (EPA QA/G-8)'.*

2 Scope of Work

Cardno carried out the following tasks in order to satisfy the purpose and objectives of this assessment.

2.1 Review / Revision of the SAQP

Cardno undertook a review of the SAQP (Rev1.3; Cardno, 2022) prior to commencement of sampling and updated the methodology for HydraSleeve® replacement following sampling, sample collection from taps, and the addition of monitoring wells MW325 and MW328 to the scope of sampling if the blockage in MW326 is unable to be cleared. The SAQP will be reviewed and further revised as required prior to the next monitoring event scheduled for April 2023.

2.2 Groundwater Monitoring

Sampling of selected groundwater monitoring wells was performed in general accordance with the SAQP, applying methods set out in Section 3 of this report. The groundwater monitoring wells monitored as part of the OMP October/November 2022 biannual sampling event are presented in Table 2-1, and are shown in Figure 3, Appendix A.

Table 2-1 Groundwater Monitoring Locations

Catchment	Sampling Frequency	Location (On-Site/ Off-Site)	Number of Monitoring Locations	Monitoring Well / Bore ID
Jack in the Box Creek	Annual (August to October)	On-Site	12*	MW051, MW311, MW315, MW317, MW318, MW319, MW321, MW323, MW326 and MW329. MW325 and MW328 (one-off sampling due to blockage in MW326).
		Off-Site	1	MW313.
	Biannual	On-Site	3	MW304, MW307, MW312.
		Off-Site	2	MW360, MW361.
Kiewa River	Annual (August to October)	On-Site	1	MW056.
		Off-Site	-	None.
	Biannual	On-Site	24	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_I, MW046_D, MW052, MW342, MW345, MW346, MW350_S, MW350_D, MW351, MW352, MW353, MW354, MW403 and MW404.
		Off-Site	3	MW356, MW357, OTH019.

* One-off sampling conducted at two wells due to blockage in MW326.

2.3 Surface Water Monitoring

The surface water sampling locations monitored as part of the OMP May 2022 biannual sampling event are presented in Table 2-2, and are shown in Figure 4, Appendix A.

Table 2-2 Surface Water Monitoring Locations

Catchment	Sampling Frequency	Location (On-Site/ Off-Site)	Number of Monitoring Locations	Monitoring Location ID
Jack in the Box Creek	Annual	On-Site	-	None.
		Off-Site	-	None.
	Biannual	On-Site	16	SW302, SW307, SW310, SW311, SW313, SW316, SW321, SW322, SW323, SW324, SW326, SW332, SW333, SW336, SW338, and SW448.
		Off-Site	7	SW424, SW427, SW430, SW431, SW432, SW434 and SW463.
Kiewa River	Annual	On-Site	-	None.
		Off-Site	-	None.
	Biannual	On-Site	12	SW340, SW346, SW349, SW355, SW370, SW374, SW375, SW379, SW380, SW382, SW387 and SW388.
		Off-Site	18	SW390, SW393, SW395, SW396, SW397, SW398, SW400, SW401, SW403, SW404, SW405, SW409, SW412, SW416, SW462, SW470, SW471 and SW487.

2.4 Sediment Monitoring

No sediment sampling was undertaken as part of the October/November biannual sampling event. The sediment monitoring is undertaken annually (February to May) to correspond with surface water sampling in low flow condition.

2.5 Data Management

All the data included in the report have been collected, uploaded to the ESdat database and reviewed according to the data management requirements of the Defence Contamination Management Manual (DCMM) Annex L (Defence, 2021b).

2.6 Deviations from the OMP SAQP

Deviations from the SAQP were attributed to a lack of sampling media or access constraints, as summarised in Table 2-3. On-site and off-site sampling and testing was planned at 46 groundwater locations and 53 surface water locations but was only completed at 41 groundwater locations and 52 surface water locations. Further details of why sampling could not be completed at some locations are provided in Table 2-3.

Table 2-3 Deviations from the SAQP

Location	Deviation	Comment/Justification	Impact on Existing Dataset
Groundwater			
MW315	Not sampled	Location dry	Data gap. Well dry, no water evident with IP. Confirmed with bailer. This is considered to have a minor impact on the dataset as downstream locations have been sampled in this event, and concentrations have previously been less than the laboratory limit of reporting (LOR).
MW317	Not sampled	Location dry	Data gap. Well dry, no water evident with IP. Confirmed with bailer. This is considered to have a minor impact on the dataset as the well has been dry historically, downstream locations were sampled in this event, and concentrations have previously been below health based guidance values.
MW318	Not sampled	Location dry	Data gap. Well dry, no water evident with IP. Confirmed with bailer. This is considered to have a minor impact on the dataset as the well has been dry historically and never been sampled previously, and downstream locations were sampled in this event.
MW326	Not sampled	Obstruction in well	Data gap. Field crew attempted to clear the blockage again but were unsuccessful. This is considered to have a moderate impact on the dataset as well MW326 is considered to be a critical location by the LC. However, wells MW325 and MW328 were sampled as replacements to provide data upgradient and downgradient of MW326.
MW356	Not sampled	Location inaccessible / safety hazard	Data gap. Area completely flooded and a high flow from the Kiewa River made the location a safety risk. This is considered to have a minor impact on the dataset as downstream locations were sampled, and concentrations have previously been below health based guidance values.
OTH019	Sampled in second visit	Location inaccessible during first event	Location inaccessible during first event. Sampled 10/11 in second visit to site. This is considered to have a minimal impact on the dataset as the location was sampled in the second visit to site and concentrations were consistent with previous sampling.
MW313, MW319, MW321	Gauging data not available	Due to a software malfunction, the gauging data for these three wells was lost.	This is considered to have a minor impact on the dataset as gauging data was able to be recorded for all other wells and inferred groundwater flow direction was generally consistent with previous events.
All wells	A single gauging round at the start of the event was not completed	Limited access to monitoring well locations due to training exercises occurring on-Base and flooding affecting access to various areas.	This is considered to have a minor impact on the dataset. Gauging was completed across a single day within each area of the Base, and the inferred groundwater flow directions were generally consistent with previous events.
Surface Water			
SW302	Not Sampled	Location dry	Data gap. Location was dry, checked after the rainfall event and still dry.

Location	Deviation	Comment/Justification	Impact on Existing Dataset
			This is considered to have a minor impact on the dataset as the downstream locations were sampled during this event. The location has not been sampled previously as it has always been found to be dry.
SW393	Sampled in second visit	Location inaccessible / safety hazard during first event	During initial sampling in October, the area was flooded and unsafe to access. Road had been closed due to the flood water. An aggressive brown snake was also encountered while investigating the potential to walk to the location. Location sampled 10/11 in second visit to site when area was no longer flooded and safe to access. This is considered to have a minor impact on the dataset as the location was sampled in the second visit, and concentrations reported are consistent with previous sampling.
SW395	Sampled in second visit	Location inaccessible / safety hazard during first event	Location unable to be sampled during initial visit due to flooding in the area. Location sampled 10/11 in second visit to site when area was no longer flooded and safe to access. This is considered to have a minor impact on the dataset as the location was sampled in the second visit, and while PFOS and PFOS+PFHxS concentrations have increased to a new maximum, they are still comparable and within the same order of magnitude as historical concentrations.

3 Methodology

3.1 Groundwater Sampling Methodology

Groundwater monitoring was undertaken as detailed in Table 3-1.

Table 3-1 Groundwater Sampling Method

Activity	Details
Dates of Field Activity	10 to 15 October and 10 November 2022
Well Gauging	Standing Water Levels (SWL) were gauged using an interface probe. All wells were measured against a specified mark at the top of the well casing.
Groundwater Field Parameters	Groundwater water quality parameter field measurements (field parameters) were recorded with a water quality meter after sample collection using extra sample water from within the HydraSleeve® decanted into a clean jar. The following field parameters were recorded using a water quality meter: ▪ pH. ▪ Electrical conductivity (EC). ▪ Oxidation reduction potential (ORP). ▪ Dissolved oxygen (DO). ▪ Temperature. Field parameters measured by the water quality meter were recorded on field data records. All field instruments (e.g., water quality meter) were calibrated by the equipment supplier to optimise the accuracy of the measurements taken. Bump tests were also completed daily by field staff during the monitoring event. Calibration certificates and bump test records are provided in Appendix D.

Activity	Details
Deployment of HydraSleeve®	The HydraSleeves® were deployed with attached weights in order for sample collection to begin at the lowest point of the well screen. The HydraSleeves® from the previous event in May 2022 were disposed and replaced with new HydraSleeves® following the gauging of all wells and prior to sampling. HydraSleeves® were replaced again after completion of sampling at each location.
Retrieval of HydraSleeve® (Sample Collection)	HydraSleeve® sampling devices were left in wells for a minimum of 4 hours when deployed with bottom weights only, to allow restabilisation of the well following the slight disturbance caused by sampler deployment. For wells with a shallow water column, HydraSleeve® sampling devices were deployed with both top and bottom weights and were left in the well for a minimum of 24 hours, to allow the top weight time to compress the HydraSleeve® into the bottom of the well. Samples were collected via continuous pull method at a rate of approximately 30 cm per second, allowing the water to pass through the check value into the sample sleeve. Samples were discharged immediately (to minimise changes in chemistry) via discharge tube.
Sample collection by bailer or tap	As per the SAQP, where insufficient water was retrieved with the HydraSleeve®, samples were collected by bailer. For bailer sampling, wells were purged three bore volumes, or until dry, whichever is sooner, prior to sample collection. Where sampling of a well was required from a tap due to access constraints, the well was purged by running water from the tap for one minute prior to sample collection.
Decontamination procedure	Dedicated HydraSleeves® were used at each groundwater monitoring well, thus removing the need for decontamination. Where HydraSleeves® could not be used, dedicated bailers were used instead which also did not require decontamination. All re-usable sampling equipment (e.g., interface probe) was thoroughly washed using PFAS & phosphate-free detergent, then double rinsed with clean water before the sample collection.
Sample identification, preservation transport and holding times	Each sample was labelled with the sample location, date, project identification number and sampler's initials. Samples were collected directly into appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under Chain of Custody (CoC) documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998 and AS 4482.1 as appropriate).
Laboratory Testing	All groundwater samples were analysed for the full PFAS analytical suite (see SAQP for full list of analytes). The primary laboratory was ALS Global Laboratories (Springvale), and the secondary laboratory (quality control) was Eurofins (Dandenong South). Both laboratories are NATA-accredited for the parameters tested. Copies of the NATA stamped laboratory reports and Chain of Custody documentation are included in Appendix C.
Laboratory Testing – Quality Control	Groundwater quality control samples were collected as follows and analysed for the full PFAS analytical suite: ▪ Field duplicate (intra-laboratory) samples at one per 10 water samples (five samples). ▪ Field triplicate (inter-laboratory) samples at one per 10 water samples (five samples). ▪ Rinsate blank samples at one per day [collected off re-used sampling equipment (e.g., interface probe)] (nine samples total). ▪ Trip blank samples of one per shipment included in the chilled sample containers upon transport to the laboratory (five sample total).

3.2 Surface Water Sampling Methodology

Surface water monitoring was undertaken using a grab method as detailed in Table 3-2.

Table 3-2 Surface Water Sampling Method

Item	Details
Dates of Field Activity	10 to 15 October and 10 November 2022
Field parameters	Surface water field parameters (i.e., pH, EC, ORP, DO, and temperature) were recorded at the time of sampling using a pre-calibrated water quality meter. Field observations such as odours and flow were also recorded on field sampling sheets.
Sampling Method	Where possible, the samples were collected directly into sample containers. Where depth permits, sample bottles were positioned at least 10 cm below the surface water level and above the sediment bed and orientated with the opening facing downwards to avoid the collection of surface films. Where access to surface water was difficult, the sample was collected by attaching the sample bottles to a long-handled sampling device (telescopic pole) which was directly filled by lowering the sample bottle into the surface water body. The sample bottles were attached so that the telescopic pole was not in direct contact with the opening of the sample bottle. Samples were collected in accordance with Australian/New Zealand Standards (AS/NZS 5667.1:1998) '*Water quality – Sampling – Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples'*.
Decontamination	All re-usable sampling equipment (e.g., telescopic pole) were thoroughly washed using phosphate-free detergent (Liquinox), and subsequently double rinsed with de-ionised water before the sample collection.
Sample identification, preservation, transport and holding times.	Each sample was labelled with the sample location, date, project identification number and sampler's initials. Sample labelling and naming was in accordance with Annex L of the DCMM (Defence, 2021b). Samples were contained in appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under Chain of Custody (COC) documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998 and AS 4482.1 as appropriate).
Laboratory Testing	All surface water samples were analysed for the full PFAS analytical suite (see SAQP for full list of analytes). The primary laboratory was ALS Global Laboratories (Springvale), and the secondary laboratory (quality control) was Eurofins (Dandenong South). Both laboratories are NATA-accredited for the parameters tested. Copies of the NATA stamped laboratory reports and Chain of Custody documentation are included in Appendix C.
Laboratory Testing – Quality Control	Surface water quality control samples were collected as follows and analysed for the full PFAS analytical suite: ▪ Field duplicate (intra-laboratory) samples at one per 10 water samples (six samples). ▪ Field triplicate (inter-laboratory) samples at one per 10 water samples (six samples). ▪ Rinsate blank samples at one per day [collected off re-used sampling equipment (e.g., telescopic pole)] (eight samples total). ▪ Trip blank samples of one per shipment included in the chilled sample containers upon transport to the laboratory (one sample total).

3.3 Quality Control / Quality Assurance

A critical aspect of site assessments is the demonstration of the quality of the data used as the basis for the assessment. This is achieved through a Data Validation process which includes a review of the following data quality indicators, as described in the SAQP:

> QA documentation.

> Bias.

> Data Representativeness.

- Data Precision & Accuracy.
- Data Comparability.
- Data Set Completeness.

A detailed review of these aspects has been undertaken, the results of which are presented in Appendix E. A summary of the data validation from the QA/QC review is included in Section 4.4 below.

3.4 Assessment Criteria

3.4.1 Groundwater and Surface Water

The adopted assessment criteria for groundwater and surface water are detailed in Table 3-3.

Table 3-3 Criteria for Groundwater and Surface Water

Exposure Scenario	Adopted Assessment Criteria		Guidance
	PFHxS / PFOS	PFOA	
	µg/L		
Human Health – Surface Water Recreational	2[2]	10	PFAS NEMP (HEPA, 2020)
Human Health – Drinking Water Quality Guideline[1]	0.07[2]	0.56	PFAS NEMP (HEPA, 2020)
Ecological (99% species protection – high conservation value systems)	0.00023[3,4]	19	PFAS NEMP (HEPA, 2020)
Ecological (95% species protection – slightly to moderately disturbed systems)	0.13[3]	220	PFAS NEMP (HEPA, 2020)

1. Drinking Water screening guidelines have been adopted for screening purposes for Industrial Water use, Stock Water use and Agriculture/Parks/Gardens Water use.
2. Combined PFOS and PFHxS.
3. PFOS only.
4. The criterion of 0.00023 µg/L is lower than the laboratory LOR, however, the PFAS NEMP (HEPA, 2020) allows for the adoption of the laboratory LOR as a screening level rather than a quantified measurement.

4 Field Observations and Results

4.1 Conditions Impacting the Sampling Event

In the seven days prior to the sampling event (3 to 9 October 2022), 36.8 mm of rain was recorded at the nearest weather station (082056), located in Wodonga. During the sampling event (10 to 15 October 2022), 59.0 mm of rain was recorded at weather station 082056. The total rainfall observed in October 2022 (187.8 mm) was significantly higher than the historical average of 91.2 mm (2020 to 2022). Significant flooding was encountered across the site due to the heavy rainfall prior to and during the October 2022 sampling event.

Sampling of surface water following a reasonable rain event (59 mm over five days) was able to be completed during this event and resulted in additional locations having sufficient water for sampling during this event, compared to the May 2022 event. However, due to the heavy rainfall during the event, some groundwater and surface water locations were inaccessible due to flooding. A few of these locations were able to be sampled during a subsequent visit to site on 10 November 2022.

The extensive flooding impacted sample collection at some locations and has the potential to impact on the results reported. No other on-site activities with the potential to impact sample collection or the results were noted.

4.2 Groundwater

4.2.1 Summary of Field Observations

4.2.1.1 Water quality parameter field measurements

Stabilised water quality parameter field measurements, water colour and turbidity observations recorded during the groundwater sampling program are presented in field sampling record sheets, included in Appendix D. Groundwater varied from clear to brown with low to high turbidity and water quality parameter field measurements were generally consistent with previous, with the exception of DO which was generally higher at the majority of monitoring well locations as compared to the May 2022 sampling event.

4.2.1.2 Groundwater Elevation and Migration

Groundwater elevation and flow direction across the three bases included in the PFAS OMP is summarised below:

- South Bandiana: Groundwater elevations observed at South Bandiana during the sampling event ranged from 160.153 mAHD at MW304 to 168.084 mAHD at MW329. Slight groundwater mounding was observed at MW329, which is consistent with previous sampling events. Groundwater flow is inferred to flow in a west to north-westerly direction toward the Jack in the Box Creek. Groundwater elevations and flow direction were generally consistent with those reported during the previous sampling event.
- North Bandiana: Groundwater elevations observed at North Bandiana during the sampling event ranged from 164.470 mAHD at MW345 to 166.906 mAHD at MW342. Groundwater flow is inferred to flow in an easterly direction toward the Kiewa River. Groundwater elevations and flow direction were generally consistent with those reported during the previous sampling event.
- East Bandiana: Groundwater elevations observed at East Bandiana during the sampling event ranged from 158.941 mAHD at MW046D to 161.947 mAHD at MW052. Groundwater flow is inferred to flow in an easterly direction toward the Kiewa River. Groundwater elevations and flow direction were generally consistent with those reported during the previous sampling event.

Groundwater elevation contours and flow directions for October 2022 are shown in Figure 2, Appendix A. Gauging data are presented in Appendix D.

4.2.2 Groundwater Laboratory Results

The results of laboratory analysis have been compared against adopted assessment criteria, and are presented in Table B1, Appendix B, and summarised in Table 4-1 below. Of the 41 primary samples that were tested, PFOA was reported above the LOR in 20 samples and PFOS+PFHxS and PFOS was reported above the LOR in 39 samples.

Table 4-1 Summary of Groundwater Results Exceeding Adopted Criteria

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR	No. Results Above Criteria	Significant Concentration Changes[3]
PFOS	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_D, MW046_I, MW051, MW052, MW056, MW304, MW307, MW311, MW312, MW313, MW319, MW321, MW323, MW325, MW328, MW329, MW342, MW345, MW346, MW350_D, MW350_S, MW351, MW352, MW353, MW354, MW357, MW360, MW361, MW403, MW404	0.00023[2]	82.4	39	39	MW346 (increase)
PFOA	MW035, MW042, MW307, MW350_S, MW403, MW404	0.56[1]	6.44	20	6	MW307 (decrease)

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR	No. Results Above Criteria	Significant Concentration Changes[3]
PFOS+PFHxS	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_D, MW046_I, MW052, MW056, MW304, MW307, MW312, MW319, MW321, MW328, MW329, MW342, MW345, MW346, MW350_D, MW350_S, MW353, MW354, MW360, MW361, MW403, MW404	0.07[1]	156	39	33	MW346 (increase)

Note:
1. Drinking water assessment criteria
2. Ecological assessment criteria
3. Significant concentration change defined as an order of magnitude increase or decrease

Results have also been compared to available historical data. The following locations have reported a significant change in concentration for this monitoring event:

- MW307: PFOA has decreased by one order of magnitude from a previous result of 49.4 µg/L in May 2022 to 4.88 µg/L in this event.
- MW346: PFOS has increased by one order of magnitude from a previous result of <0.01 µg/L in May 2022 to 0.1 µg/L in this event. PFOS+PFHxS has also increased by one order of magnitude from a previous result of <0.01 µg/L in May 2022 to 0.17 µg/L in this event.

A summary of locations where a first-time detection, or a new exceedance of guideline values were reported is provided in Table 4-2 below. The laboratory reports are provided in Appendix C.

Table 4-2 Summary of Groundwater Results with First-time Detections or New Exceedances of Adopted Criteria

Deviation Type	Monitoring Well	PFOS+PFHxS concentration (µg/L)		PFOA concentration (µg/L)		PFOS concentration (µg/L)	
		October 2022	Previous Maximum	October 2022	Previous Maximum	October 2022	Previous Maximum
First-time detections	MW051	0.02[1]	<0.01	<0.01	<0.01	0.02[1]	<0.01
	MW304	**0.62**	**0.16[1]**	0.03	<0.02	**0.3**	**0.1[1]**
	MW328	**0.18**	<0.05	<0.01	<0.05	**0.13**	<0.05
	MW346	**0.17**	<0.01	<0.01	<0.01	**0.1**	<0.01
New exceedance of lowest adopted guideline values	MW328	**0.18**	<0.05	<0.01	<0.05	**0.13**	<0.05
	MW346	**0.17**	<0.01	<0.01	<0.01	**0.1**	<0.01

Note:
Location with first-time detection of PFOS+PFHxS, PFOA or PFOS in latest monitoring round
Location with a new exceedance of lowest adopted guideline values in latest monitoring round
Bold: Exceedance of lowest adopted guideline values
1. Result recorded on quality control (duplicate or split) sample

Findings are summarised as follows:

- Two groundwater sampling locations (MW328 and MW346) reported a new exceedance of the Drinking Water criterion for PFOS+PFHxS.
- Groundwater sample MW328 was re-analysed as a first-time detection was reported, which exceeded the Drinking Water criterion for PFOS+PFHxS (0.18 µg/L) and the Ecological criterion for PFOS (0.13 µg/L). The duplicate of MW328 reported concentrations of PFOS and PFOS+PFHxS below the laboratory LOR. This discrepancy is discussed further in the Data Quality Review, Appendix E.
- Three groundwater sampling locations (MW051, MW328 and MW346) reported a first-time detection of PFOS+PFHxS.
- One groundwater sampling location (MW304) reported a first-time detection of PFOA.
- Two groundwater sampling locations (MW328 and MW346) reported a first-time detection of PFOS.

4.3 Surface water

4.3.1 Summary of Field Observations

4.3.1.1 Water quality parameter field measurements

Stabilised water quality parameter field measurements, water colour and turbidity observations recorded during the surface water sampling program are presented in field sampling record sheets, included in Appendix D. Surface water varied from cloudy to brown with low to high turbidity and flow rate ranged from low to medium. Flow rates were generally similar to or increased compared to those observed in May 2022. Water levels were higher across all surface water locations and water was present at most locations due to high rainfall and extensive flooding prior to and during the sampling event in October 2022.

As noted in Section 4.1, during the October 2022 sampling event some on-site locations were unable to be sampled as they were dry and/or inaccessible due to flooding during the event. Two locations (SW393 and SW395) were able to be accessed and sampled during the second visit to site on 10 November 2022.

4.3.2 Surface Water Laboratory Results

The results of laboratory analysis have been compared against adopted assessment criteria, presented in Table B2, Appendix B, and summarised in Table 4-3 below. Of the 52 primary samples that were tested, PFOA was reported above the LOR in 20 samples, PFOS was reported above the LOR in 45 samples and PFOS+PFHxS was reported above the LOR in 46 samples.

Table 4-3 Summary of Surface Water Results Exceeding Adopted Criteria

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR	No. Results Above Criteria	Significant Concentration Changes[3]
PFOS	SW307, SW310, SW311, SW313, SW316, SW321 SW322, SW323, SW324, SW326, SW332, SW333, SW336, SW338, SW340, SW346, SW349, SW355, SW370, SW374, SW375, SW379, SW380, SW387, SW388, SW395, SW396, SW397, SW398, SW400, SW401, SW403, SW405, SW409, SW412, SW424, SW427, SW430, SW431, SW432, SW448, SW463, SW470, SW471, SW487	0.00023[2]	5.98	45	45	SW403 (decrease) SW427, SW430 (increase)
PFOA	-	0.56[1]	0.24	20	0	-

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR	No. Results Above Criteria	Significant Concentration Changes[3]
PFOS+PFHxS	SW307, SW310, SW311, SW313, SW316, SW321, SW322, SW323, SW324, SW326, SW332, SW333, SW336, SW338, SW340, SW346, SW349, SW355, SW370, SW374, SW375, SW379, SW380, SW387, SW388, SW395, SW396, SW397, SW398, SW400, SW401, SW409, SW424, SW427, SW430, SW431, SW432, SW448, SW463, SW470, SW471, SW487	0.07[1]	7.21	46	42	SW403 (decrease) SW427, SW430 (increase)

Note:
1. Drinking water assessment criteria.
2. Ecological assessment criteria.
3. Significant concentration change defined as an order of magnitude increase or decrease.

Results have also been compared to available historical data. The following locations have reported a significant change in concentration for this monitoring event:

- SW403: PFOS has decreased by one order of magnitude from a previous result of 0.2 µg/L in May 2022 to 0.02 µg/L in this event. PFOS+PFHxS has also decreased by one order of magnitude from a previous result of 0.58 µg/L in May 2022 to 0.04 µg/L in this event.
- SW427: PFOS has increased by one order of magnitude from a previous result of 0.03 µg/L in May 2022 to 0.4 µg/L in this event. PFOS+PFHxS has also increased by one order of magnitude from a previous result of 0.03 µg/L in May 2022 to 0.53 µg/L in this event.
- SW430: PFOS has increased by one order of magnitude from a previous result of <0.01 µg/L in May 2022 to 0.13 µg/L in this event. PFOS+PFHxS has also increased by one order of magnitude from a previous result of <0.01 µg/L in May 2022 to 0.17 µg/L in this event.

A summary of locations where a first-time detection, or a new exceedance of guideline values were reported is provided in Table 4-4 below. The laboratory reports are provided in Appendix C.

Table 4-4 Summary of Surface Water Results of First-time Detections and New Exceedances of Adopted Criteria

Deviation Type	Monitoring Location	PFOS+PFHxS concentration (µg/L)		PFOA concentration (µg/L)		PFOS concentration (µg/L)	
		October 2022	Previous Maximum	October 2022	Previous Maximum	October 2022	Previous Maximum
New exceedance of lowest adopted guideline values	SW398	**0.08**	0.0009	<0.01	<0.01	**0.04**	**0.0009**

Note:
Location with first-time detection of PFOS+PFHxS, PFOA or PFOS in latest monitoring round
Location with a new exceedance of lowest adopted guideline values in latest monitoring round
Bold: Exceedance of lowest adopted guideline values

Findings are summarised as follows:

- One surface water sampling location (SW398) reported a new exceedance of the Drinking Water criterion for PFOS+PFHxS.
- No surface water samples reported a first-time detection in this event.

4.4 Data Validation

The data validation process has concluded that there are no significant systematic errors in the data collection process. Therefore, the data set used as the basis for the surface water and groundwater assessment are considered valid and complete. A detailed Data Quality Review is included in Appendix E.

5 Summary and Conclusions

Cardno conducted the October/November 2022 biannual groundwater and surface water monitoring event at BMA as part of the PFAS OMP. On-site and off-site sampling and testing was undertaken at 41 groundwater monitoring wells and 52 surface water locations.

Groundwater levels were gauged in all accessible wells before sampling. Groundwater flow was interpreted be generally consistent with May 2022 with flow in a west to north-westerly direction from South Bandiana towards Jack in the Box Creek, and flow in an easterly direction from North Bandiana and East Bandiana towards the Kiewa River.

Table 5-1 Summary of Results

Activity	Details
Deviations from OMP SAQP	> Three groundwater wells and one surface water location were not sampled due to locations being dry. > One groundwater well not sampled due to blockage in the well. > One groundwater well was not sampled due to location being inaccessible due to flooding. > Two surface water sampling locations and one groundwater well were not sampled in the first event due to the locations being inaccessible due to flooding but were sampled in a subsequent visit to site on 10 November 2022.
Groundwater Analytical Results	> 41 groundwater samples were collected in total. > Two samples reported a new exceedance of the Drinking Water criterion for PFOS+PFHxS. > Groundwater sample MW328 was re-analysed as a first-time detection was reported, which exceeded the Drinking Water criterion for PFOS+PFHxS and the Ecological criterion for PFOS. The duplicate of MW328 reported concentrations of PFOS and PFOS+PFHxS below the laboratory LOR. This discrepancy is discussed further in the Data Quality Review, Appendix E. > Three samples reported a first-time detection of PFOS+PFHxS. > One sample reported a first-time detection of PFOA. > Two samples reported a first-time detection of PFOS. > One groundwater sample reported an order of magnitude decrease for PFOA compared to the previous event. > One groundwater sample reported an order of magnitude increase for PFOS and PFOS+PFHxS compared to the previous event. > All other concentrations reported during this event were generally consistent with the previous sampling events.
Surface Water Analytical Results	> 52 surface water samples were collected in total. > One surface water sample reported a new exceedance of the Drinking Water assessment criterion for PFOS+PFHxS. > No samples reported a first-time detection. > One surface water sample reported an order of magnitude decrease for PFOS and PFOS+PFHxS compared to the previous event. > Two surface water samples reported an order of magnitude increase for PFOS and PFOS+PFHxS compared to the previous event. > All other concentrations reported during this event were generally consistent with previous sampling events.
Sediment Monitoring	> No sediment sampling was undertaken as part of August to October biannual sampling event. The sediment monitoring is undertaken annually (February to May) to correspond with surface water sampling in low flow condition.
Next Scheduled Monitoring Event	> The next OMP monitoring event is scheduled for April 2023. > SAQP to be reviewed and updated as required prior to the next monitoring event.

Notes

Denotes first-time detection above LOR in latest monitoring round

Denotes new exceedance of lowest adopted screening criteria in latest monitoring round

Groundwater Samples
Surface Water Samples

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 30 (1-30 x EQL); 30 (30-30 x EQL); 30 (>30 x EQL).
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories.
Any methods in the row header relate to those used in the primary laboratory.

Surface Water Samples

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 30 (1-30 x EQL); 30 (30-30 x EQL); 30 (>30 x EQL).
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory.

Facsimile	: ----	Facsimile	: [redacted]
Project	: VIC_0445_PFASOMP	Page	: 1 of 2
Order number	: DEF19008	Quote number	: EM2022MWHAUS0003 (SY/139/19_Bandiana)
C-O-C number	: 43395	QC Level	: NEPM 2013 B3 & ALS QC Standard
Site	: Bandiana P01		
Sampler	: [redacted]		

Dates

Date Samples Received	: 17-Oct-2022 13:15	Issue Date	: 18-Oct-2022
Client Requested Due Date	: 24-Oct-2022	Scheduled Reporting Date	: **24-Oct-2022**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Not Available
No. of coolers/boxes	: 3	Temperature	: 5.5°C
Receipt Detail	:	No. of samples received / analysed	: 8 / 8

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Any sample identifications that cannot be displayed entirely in the analysis summary table will be listed below.

EM2220270-003 : 12-Oct-2022 13:11 : 0445_SW400_221012 - Interal lab qc

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **WATER**

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Organic Chemist	[redacted]

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- Amendment (7/12/22):This report has been amended following the request form B.K to transfer samples 007 and 008 from this work order and put into work order EM2220286
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

No. of samples analysed	: 6		

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2220270**	Page	: 1 of 4
Amendment	: **1**		
Client	: **STANTEC AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Telephone	: [redacted]
Project	: VIC_0445_PFASOMP	Date Samples Received	: 17-Oct-2022
Site	: Bandiana P01	Issue Date	: 07-Dec-2022
Sampler	: [redacted]	No. of samples received	: 8
Order number	: DEF19008	No. of samples analysed	: 6

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This re4ort su4ersedes any 4revious re4ort(s) with this reference. Results a44ly to the sam4le(s) as submitted, unless the sam4ling was conducted by ALS. This document shall not be re4roduced, exce4t in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in com4liance with 4rocedures s4ecified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Organic Chemist	[redacted]

General Comments

The analytical 4rocedures used by ALS have been develo4ed from established internationally recognised 4rocedures such as those 4ublished by the USEPA, APHA, AS and NEPM. In house develo4ed 4rocedures are fully validated and are often at the client request.

Where moisture determination has been 4erformed, results are re4orted on a dry weight basis.

Where a re4orted less than (<) result is higher than the LOR, this may be due to 4rimary sam4le extract/digestate dilution and/or insufficient sam4le for analysis.

Where the LOR of a re4orted result differs from standard LOR, this may be due to high moisture content, insufficient sam4le (reduced weight em4loyed) or matrix interference.

When sam4ling time information is not 4rovided by the client, sam4ling dates are shown without a time com4onent. In these instances, the time com4onent has been assumed by the laboratory for 4rocessing 4ur4oses.

Where a result is required to meet com4liance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of re4orting
^ = This result is com4uted from individual analyte detections at or above the level of re4orting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP271X - Per- and Polyfluoroalkyl Substances (PFAS): Sam4les received in 20ml or 125ml bottles have been tested in accordance with the QSM5.7 com4liant, NATA accredited method. 30mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP271: Stable isoto4e enriched internal standards are added to sam4les 4rior to extraction. Target com4ounds have a direct analogous internal standard with the exce4tion of PFPeS, PFH4A, PFDS, PFTrDA and 10:2 FTS. These com4ounds use an internal standard that is chemically related and has a retention time close to that of the target com4ound. The DQO for internal standard res4onse is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These 4ractices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.7 (US DoD) requirements.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2220271**	Page	: 1 of 4
Client	: **STANTEC AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Telephone	: [redacted]
Project	: VIC_0554_PFASOMP	Date Samples Received	: 17-Oct-2022
Site	: Public Lands	Issue Date	: 20-Oct-2022
Sampler	: [redacted]	XoYof samples received	: 20
Order number	: DEF19008	XoYof samples analysed	: 20

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

. rief method summaries and references are also provided to assist in traceabilityY

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) ReportY

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding timesNthis should be taken into consideration when interpreting resultsY

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 856N APHAN AS and XEPM) based on the sample container providedY Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and rerunsYA listing of breaches (if any) is provided hereinY

Holding time for leachate methods (eYgY TCLP) vary according to the analytes reportedY Assessment compares the leach date with the shortest analyte holding time for the equivalent soil methodY These are: organics 15 daysNmercury 28 days & other metals 180 daysY A recorded breach does not guarantee a breach for all non-volatile parametersY

Holding times for ***VOC in soils*** vary according to analytes of interestY Vinyl Chloride and Styrene holding time is 7 days; others 15 daysY A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concernY

Matrix: **WATER** Evaluation: × = Holding time breach ; ✓ = Within holding timeY

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and XEPMY. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231B	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS. Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 4.2 Table B-14 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 4.2 Table B-14 requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2222364**	Page	: 1 of 4
Client	: **STANTEC AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Telephone	: [redacted]
Project	: VIC_0445_PFASOMP	Date Samples Received	: 11-Nov-2022
Site	: Bandiana-P02	Issue Date	: 16-Nov-2022
Sampler	: ----	No. of samples received	: 2
Order number	: DEF19008	No. of samples analysed	: 2

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count		Rate (%)		Quality Control Specification
	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	1	17	5.88	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	17	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Sample Receipt Advice

Company name:	Stantec Australia Pty Ltd (VIC)
Contact name:	[redacted]
Project name:	Not provided
Project ID:	VIC_0445_PFAS
Turnaround time:	5 Day
Date/Time received	Oct 17, 2022 12:00 PM
Eurofins reference	932350

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✗	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Sum of PFASs (n=30)*	0.1	ug/L	0.15

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Per- and Polyfluoroalkyl Substances (PFASs)			
Perfluoroalkyl carboxylic acids (PFCAs)	Melbourne	Nov 17, 2022	28 Days
- Method: LTM-ORG-2100 Per- and Polyfluoroalkyl Substances (PFAS)			
Perfluoroalkyl sulfonamido substances	Melbourne	Nov 17, 2022	28 Days
- Method: LTM-ORG-2100 Per- and Polyfluoroalkyl Substances (PFAS)			
Perfluoroalkyl sulfonic acids (PFSAs)	Melbourne	Nov 17, 2022	28 Days
- Method: LTM-ORG-2100 Per- and Polyfluoroalkyl Substances (PFAS)			
n:2 Fluorotelomer sulfonic acids (n:2 FTSAs)	Melbourne	Nov 17, 2022	28 Days

Test Counts						1

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Method Blank

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

DATA QUALITY REVIEW

Data Quality Review
Bandiana Military Area, VIC

This Appendix reviews the Quality Assurance (QA) and Quality Control (QC) documentation. Quality assurance encompasses the actions, procedures, checks and decisions undertaken to ensure sample integrity and representativeness, and the reliability and accuracy of analysis results. The QA documentation should also include an indication of the Data Quality Objectives sought in relation to each significant action, test or process involved in the Assessment.

QC activities measure the effectiveness of the QA procedures by undertaking testing, and then comparing results to previously established objectives. QC work will include the internal laboratory testing as well as results of QC samples submitted such as trip blanks and duplicates. The quality of the information and/or data is deemed satisfactory when the QC results demonstrate that agreed objectives have been met.

Cardno undertook a review of its QA/QC as part of the data validation exercise. The findings are summarised below.

QA/QC Aspects	Evidence and Evaluation
	QA Documentation
Sampling and Analysis Quality Plan and Data Quality Objectives	Cardno was engaged by Department of Defence (the client) to carry out the PFAS Ongoing Monitoring Plan (OMP) at Bandiana Military Area (the Site). The monitoring event commenced on 10 October and concluded 15 October 2022. Additional sampling was completed on 10 November 2022. The monitoring event was completed in general accordance with the scope and limitations presented in Cardno's Sampling and Analysis Quality Plan (SAQP) of 20 October 2022 (Our Ref: OMP002_Bandiana_ SAQP_Rev1.3). The assessment was carried out in general compliance with the following: ▪ Australian Standard AS 4482-2005 Guide to the investigation and sampling of sites with potentially contaminated soils, Part 1 - Non-volatile and semi-volatile compounds. ▪ Department of Defence (2021), Contamination Management Manual (DCMM), Annex L – Data Management, August 2019, Amended June 2021. ▪ Department of Defence (2019), Pollution Prevention Guideline - Routine Water Quality Monitoring, Department of Defence, Department of Energy, 2018, Quality System Manual Schedule B15. ▪ EPA Victoria (2009), Industrial Waste Resources Guidelines, Sampling and Analysis of Waters, Wastewaters, Soils and Wastes, Publication 701. ▪ Heads of Environmental Protection Authority's Australia and New Zealand (HEPA) (2020), PFAS National Environmental Management Plan (NEMP) Version 2.0, January 2020. ▪ National Environment Protection Council (NEPC), 1999, National Environmental Protection (Assessment of Site Contamination) Measure (as amended 2013) (ASC NEPM). ▪ National Health and Medical Research Council (NHMRC) (2019), Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water, August 2019. ▪ USEPA (2006), Guidance for the Data Quality Objectives Process (EPA QA/G-4). A quality control program was implemented during the investigation and the quality assurance procedures used have been reiterated in the report.

QA/QC Aspects	Evidence and Evaluation
	The investigation was carried out in accordance with the Safe Work method Statements (SWMS) and Health, Safety and Environment Plan (HSEP) for the Site. Detailed work plans were also provided and are outlined in the SAQP. The Data Quality Objectives were expressed in terms of the purpose of the assessment and the relevant assessment criteria.
Data Validation Report	This review constitutes a data validation review. This was supported by an Esdat generated "QAQC Checker" excel report, summarised in Tables B3 and B4, Appendix B.
Data Representativeness	
Holding Times	Groundwater and surface water sample analysis holding times were in conformance with EPA Publication IWRG701 2009 *'Sampling and Analysis of Waters, Wastewaters, Soils and Wastes*.
Background Samples	No background samples were collected as part of this assessment.
Equipment Decontamination	The decontamination methodology conducted during this investigation is documented in the body of the report, and was in general conformance with the SAQP and work plans. ▪ Reusable sampling equipment was rinsed with Liquinox® and deionised water prior to the collection of each sample.
Data Precision and Accuracy	
QC Testing – Blind Replicates (Primary Lab)	***Groundwater*** ▪ Acceptance Criteria: RPD < 30% ▪ Groundwater Samples Analysed: 41 ▪ Blind Replicate Samples Analysed (ALS duplicates): 5 ▪ Blind Replicate Analyte Pairs: 140 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 8 ▪ Percentage of Analyte Pairs Exceeding Criteria: 5.7% RPD exceedances were associated with PFAS compounds. Analyte concentrations from the primary sample and their corresponding blind replicate sample pairs were all within one order of magnitude. The majority of PFAS RPD exceedances are attributed to low concentrations of analyte pairs. This is not considered to impact the results of the investigation. The RPD results are presented in Table B3, Appendix B. ***Surface water*** ▪ Acceptance Criteria: RPD < 30% ▪ Surface water Samples Analysed: 52 ▪ Blind Replicate Samples Analysed: 6 ▪ Blind Replicate Analyte Pairs: 168 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 3 ▪ Percentage of Analyte Pairs Exceeding Criteria: 1.8% RPD exceedances were associated with PFAS compounds. Analyte concentrations from the primary sample and their corresponding blind replicate sample pairs were all within one order of magnitude. The majority of PFAS RPD exceedances are attributed to low concentrations of analyte pairs. This is not considered to impact the results of the investigation. The RPD results are presented in Table B3, Appendix B.
QC Testing – Field Splits (Secondary Lab)	***Groundwater*** ▪ Acceptance Criteria: RPD < 30% ▪ Groundwater Samples Analysed: 41 ▪ Blind Replicate Samples Analysed: 5 ▪ Blind Replicate Analyte Pairs: 140 (excludes 'analytes' that are a summation of other analytes)

QA/QC Aspects	Evidence and Evaluation
	▪ Number of Analyte Pairs Exceeding Criteria: 5 ▪ Percentage of Analyte Pairs Exceeding Criteria: 3.6% RPD exceedances were associated with PFAS compounds. The majority of PFAS RPD exceedances are likely attributed to low concentrations of analyte pairs. A number of RPD exceedances may also be attributed to interlaboratory differences, which can be common and significant, based on a study done by the Queensland Department of Environment and Science and the Victorian Environment Protection Authority (Vardy et al, 2018). Overall, these RPD exceedances are not considered to impact the results of the investigation. The RPD results are presented in Table B3, Appendix B. ***Surface water*** ▪ Acceptance Criteria: RPD < 30% ▪ Surface water Samples Analysed: 52 ▪ Blind Replicate Samples Analysed: 6 ▪ Blind Replicate Analyte Pairs: 168 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 25 ▪ Percentage of Analyte Pairs Exceeding Criteria: 14.9% RPD exceedances were associated with PFAS compounds. The majority of PFAS RPD exceedances are likely attributed to low concentrations of analyte pairs. A number of RPD exceedances may also be attributed to interlaboratory differences, which can be common and significant, based on a study done by the Queensland Department of Environment and Science and the Victorian Environment Protection Authority (Vardy et al, 2018). Overall, these RPD exceedances are not considered to impact the results of the investigation. The RPD results are presented in Table B3, Appendix B.
Trip Blanks	Five (5) trip blanks were collected, and laboratory tested for PFAS. All analytes were reported below the limit of reporting (LOR). Trip blank results are presented in Table B4, Appendix B.
Laboratory Internal QC	Evidence of the laboratories internal QC testing is present and complete. Both ALS (the primary laboratory) and Eurofins-mgt performed internal QC with adequate testing and mostly satisfactory results for matrix spikes, method blanks and laboratory duplicates. Exceptions include: **Report EM2220286** ▪ Matrix Spike: did not determine a matrix spike recovery as the background level was in excess of spike level for select PFAS compounds, or recovery less than lower data quality objective for select PFAS compounds. ▪ Surrogate Recovery: recovery less than lower data quality objective for select PFAS compounds. **Report EM2222364** ▪ Quality Control Sample Frequency: Less than the specification outlined in NEPM 2013 B3 and ALS QC Standard These exceptions are not considered to impact the results of the investigation.
Laboratory Method Detection Limit	Laboratory reports indicate the method detection limits were lower than the respective assessment criteria.
NATA endorsement of laboratory reports	Laboratory reports were stamped with the NATA endorsement stamp and signature. Laboratory reports are included in Appendix C of this report.
Calibration of Field Equipment	All field equipment used was calibrated by the equipment supplier. Certificates and daily bump test records are included in Appendix D of this report.
Decontamination and Equipment Blanks	Nine (9) rinsate blanks were collected during the investigation. Rinsate blank samples were tested for PFAS which all reported a concentration below the laboratory LOR. Results are shown in Table B4, Appendix B.

QA/QC Aspects	Evidence and Evaluation
Data Comparability	
Full Review of Data	Once all results have been received, Cardno undertook a full review of the data for any anomalies in consideration of historical data at each location (where available), such as first-time detections or exceedances being reported at locations which have not had detections or exceedances previously. Where potentially anomalous data is identified or suspected, further confirmatory measures were undertaken such as re-extraction and reanalysis of the sample by the laboratory and/or additional data quality review. The following samples were reanalysed: MW051, MW304, MW307, MW328, MW346, SW398, SW427 and SW430. All original results were confirmed, with the exception of MW328. Groundwater sample MW328 was re-analysed as a first-time detection was reported, which exceeded the Drinking Water criterion for PFOS+PFHxS (0.18 µg/L) and the Ecological criterion for PFOS (0.13 µg/L). The original extract (e.g. first bottle) was reanalysed and the results were consistent, however, the duplicate of MW328 reported concentrations of PFOS and PFOS+PFHxS below the laboratory LOR. The comparison of RPDs for the samples are included in Table B3, Appendix B, and the primary and duplicate results for PFOS and PFHxS are 171% and 133%, respectively. No other PFAS compounds were reported above the LOR in either the primary or the duplicate. As the water for both bottles was collected from the same water in a single Hydrasleeve deployment, and as this well was historically <LOR, this may indicate a potentially anomalous result in the first bottle. Further sampling as part of the OMP would confirm this. The primary and duplicate results are presented in Table B2, Appendix B, and the higher of the two results has been conservatively adopted for the summary of results discussed in the report and presented in Figure 3, Appendix A.
Standard Procedures	Fieldwork procedures are detailed in the report and followed the work methods outlined in the SAQP.
Qualified Personnel	Staff involved in managing and reviewing the project and those involved in fieldwork are qualified personnel.
Sample Integrity	Field Chain of Custody forms are included in Appendix C of this report and demonstrate sample integrity.
Data Completeness	
Completeness of Test Program	The scope of work undertaken was generally consistent with that set out in the SAQP. Variations to the SAQP are detailed in the Factual Report.
Validity of Data Set	The data quality review indicates no significant systematic errors in the data collection process for surface water and groundwater and therefore, the data set used as the basis for the assessment is considered valid and complete.

APPENDIX

F

INFORMATION ABOUT ENVIRONMENTAL REPORTS

About Site Environmental Assessment Reports

1. Introduction

This document explains the Environmental Site Assessment (ESA) process and the context that applies to the use of Environmental Reports issued by Cardno.

2. What is an ESA?

Environmental Site Assessments (ESA) are undertaken for a range of purposes, specific to the brief issued by the client in each case. The scope may include one or a combination of any of the following:

- A factual report of the condition of a portion of the site or one aspect of an entire site.
- Assessment of the contamination levels in soil to be removed from a site – a waste classification assessment.
- Validation of the success of remediation of a site or a portion of a site.
- Provision of a professional opinion about the suitability of a site for one or more uses, in terms of its contamination status.

The scope of any ESA needs to be defined at the outset.

An ESA is not an Environmental Audit. Such audits are undertaken in accordance with the provisions of regulations enacted in various states of Australia, and are referred to as Site Audits in some jurisdictions. Statutory audits provide certification by EPA accredited auditors that a site is suitable for one or more uses. An ESA may provide similar advice but cannot be used in place of an audit if the latter is required by regulation in any instance. However in some circumstances and jurisdictions an ESA is sufficient to provide "environmental sign-off" of a site.

An ESA may be undertaken for due diligence purposes, to establish whether the site has been impacted to the extent that some beneficial uses of the site may be precluded. Due diligence audits in many cases may be completed as non-statutory Audits, although in some jurisdictions they can also be statutory audits, if defined as such at the outset.

3. The ESA Process

The Client generally initiates the ESA process by specifying a brief which identifies the specific objectives of the assessment. If not, it is the consultants' duty to so specify the ESA

In the case of an ESA to provide an opinion about the suitability of the site for use, it would be conducted in accordance with NEPM (Site Assessment). Such ESA would not commence until a thorough site history assessment (Phase 1 Assessment: to identify the potential for significant contamination at a site) is conducted. However, where the history is unclear, a broad screening of chemical parameters can be used to test environmental media. This normally includes a broad range of organic and inorganic compounds and elements, often referred to as an Environmental Screen.

(In the case of an ESA for a purpose other than to provide an opinion about the suitability of the site for use, it is not always necessary to undertake a Phase 1 assessment.)

The ESA requires sampling of soil at representative locations across the site. A NATA accredited laboratory performs the analysis of soil. It is impractical for all of the soil to be assessed. The ESA is often based on a statistical method of grid or random sampling, augmented by targeted sampling at locations known or suspected to be contaminated. Guidance on sampling strategy and density is provided in Australian Standard AS4482.1–2005. However, some considerable degree of judgement is still required in the application of any sampling and testing strategy. For example the blanket application of the "hot spot" method presented in this standard is often inappropriate given its limitations.

The field program also investigates the likelihood of contamination below the site surface. Field investigations must sample and test fill as well as the natural soils. If contamination is found then it is common for further work to be undertaken to characterise, to the extent practical, its vertical and horizontal extent. However, where fill is encountered and testing shows it to be uncontaminated, it must be realised that the heterogeneous nature of the material might mean that not all pockets of contaminated material can be detected using normal sampling regimes.

EPA guidelines for auditors, that may be relevant for an ESA, indicate the need in all cases to consider the potential for groundwater contamination in any site. This does not mean all sites need to be drilled to sample groundwater, but it is most often the case. Most hydrogeological settings and groundwater conditions are complex and vary in space and time. The condition of groundwater is investigated to identify if any beneficial use or environmental value of groundwater is precluded due to contamination.

As previously stated for soil, all groundwater at the site cannot be tested. The environmental investigations are conducted in accordance with industry standards and guidelines (e.g. EPA Vic Pub 668). This provides a level of confidence that a sufficiently comprehensive assessment of the groundwater at the site is achieved.

Where an investigation shows that groundwater is polluted, consideration should be given to assessing the risks and the need for and practicality of any clean up.

4. Environmental Assessment Report

The ESA Report details the findings of the ESA. It provides summary information on the site definition, the reasons for the assessment and other relevant facts. It reviews the scope and quality of the site investigations, laboratory testing and data analyses undertaken. These reports also present a review of the contamination status of the site, the need for any further clean up, and an opinion on the suitability of the site for a range of beneficial uses and land uses such as “residential – low density”, “commercial” etc, as appropriate.

However, as noted above, some ESA have a narrow scope such as for classification of waste soil for removal from site, and do not make conclusions on suitability of site for use.

The ESA Report generally includes copies of other documents and reports, necessary to support the assessment findings, presented as appendices. These can contain more detailed information than the body of the ESA Report. Care should be taken to also read the appended documents and the ESA report in full.

Cardno generally issues reports in electronic form (e-Report) on CD ROM. ESA Reports are issued in this format as Adobe Acrobat™ PDF files. However, a paper copy of the executive summary of the ESA Report is generally issued to the client, and others as required by the brief or by regulation.

5. Limitations of Environmental Assessment Report

The ESA Report is prepared in a manner that can be easily read by a lay person with a legitimate interest in the contamination status of the site, such as the site owner or occupier, EPA and Local Planning Authority. The ESA report is not intended for use by other parties or for other purposes. Anyone who uses the assessment report for purposes other than specified in the report, does so at their own risk.

The site should only be used for one or more of the beneficial uses and land uses identified in the ESA as suitable.

The conditions and qualifications may apply to the suitability of the site for use, and it is the responsibility of the Client to be cognizant of and accept these in accepting the report. Cardno are only responsible for the issuing of the ESA report but accepts no liability for the costs incurred in the implementation of ESA findings.

The ESA provides a “snapshot” of the site conditions at the time of the site investigation. Consequently, the report may not be valid at a later time if there has been any change to the contamination status of the site in that time. Verification of the status of the site may be required in cases where a significant time has elapsed, or site conditions have changed since the assessment and audit.

The ESA is necessarily limited by constraints such as time, cost and available information; although normal professional practice at the time has been applied with all due care to prepare the report. A necessary requirement of this process is the horizontal and vertical interpolation of data from discrete locations. However, site conditions are generally not homogenous and some discrepancies will occur between the actual and predicted results at locations not directly sampled. There is a risk that contamination may occur at the site and not be identified by a competent investigation and assessment. The approach adopted in sampling (a combination of statistically based grid and judgmental sampling) seeks to reduce, but cannot eliminate, this risk.

Where unexpected occurrences of contamination arise, subsequent to the issue of the ESA Report, Cardno should be permitted to make an interpretation of these facts in relation to the ESA Report findings. Consequently, the Client should inform Cardno and seek their opinion. Cardno accepts no liability for costs incurred due to such

unexpected occurrences, given the inherent uncertainties in the assessment process.

Cardno uses information provided by other parties as the basis for the ESA, and reliance on this information is at the discretion of Cardno. However, however Cardno cannot guarantee any of the facts, findings or conclusions presented by other parties. Cardno will not be liable for the use of information, provided by others that is subsequently found to be intentionally misleading.

The ESA Report is not and does not purport to be anything other than a contaminated land ESA. It is not a geotechnical report and bore logs reproduced are for interpretation of the likely distribution of contamination. They are not intended for geotechnical interpretations and may not be adequate for this purpose.

The ESA Report is not intended to be a comprehensive analysis of the presence and associated risk of asbestos in buildings and services. Where asbestos in buildings and services is known or likely, the report may only caution that an appropriately qualified person be engaged to undertake demolition to avoid contamination of the site.

ORP	Oxidation-Reduction Potential
ppm	Parts per Million
µg/L	Micrograms per Litre
µS/cm	Micro Siemens per Centimetre (Electrical Conductivity - Water)

Site Specific

OMP	Ongoing Monitoring Plan
DCMM	Defence Contamination Management Manual
ESdat	Environmental data management software

1 Introduction

1.1 Background

Cardno was engaged by the Department of Defence ("Defence" or "the Client") to carry out the Per- and Poly-Fluoroalkyl Substances (PFAS) Ongoing Monitoring Plan (OMP) at Bandiana Military Area ("the Site"). The Bandiana Military Area (BMA) is comprised of three individual properties identified as North Bandiana (Gaza Ridge Barracks), South Bandiana (Gaza Ridge Barracks) and East Bandiana (Wadsworth Barracks).

The OMP was carried out in general accordance with the scope and limitations presented in Cardno's Sampling and Analysis Quality Plan (SAQP):

> Cardno, 27 April 2023 Reference: DEF19008_OMP002, '*PFAS Ongoing Monitoring Plan Sampling and Analysis Quality Plan (SAQP) Bandiana Military Area'*, Rev 1.4.

For the purposes of this report:

> The "On-Site Monitoring Area" (the 'Site') is defined as BMA and is comprised of three individual properties identified as North Bandiana (Gaza Ridge Barracks), South Bandiana (Gaza Ridge Barracks) and East Bandiana (Wadsworth Barracks).

> The "Off-Site Monitoring Area" is defined as comprising Jack in the Box Creek to the north west of South Bandiana to its confluence with Wodonga Creek, an unnamed creek to the east of North Bandiana to its confluence with the Kiewa River, and the Kiewa River and western Kiewa River floodplain from Middle Creek in the south to north of the unnamed creek.

> The "Management Area" (MA) is defined as comprising the On-Site Monitoring Area and the Off-Site Monitoring Area.

The location of the Site (BMA), MA, the On-Site Monitoring Area and the Off-Site Monitoring Area are displayed in Figure 1 of Appendix A.

1.2 Purpose & Objectives

The objective of the OMP is to assess the changes in the nature and extent of PFAS within the environment, specifically where there is an identified potentially elevated risk to a receptor or a potential future risk to a receptor associated with Defence's historical use of Aqueous Film Forming Foam (AFFF).

The purpose of this PFAS OMP factual report is to provide an up-to-date status of the condition of the Site as it is currently understood in relation to the most recent sampling event.

The objectives of the report are:

> To provide a succinct summary of the May 2023 sampling event and provision of analytical results with supporting tables and figures.

> To provide confirmation of the current understanding of risk.

> To provide supporting data for the assessment of management actions, where relevant.

1.3 Relevant Guidelines

This assessment has been undertaken in general accordance with applicable industry standards for a site investigation for the purpose, objectives and scope identified in this report. These standards are set out in:

> Australian and New Zealand Guidelines, 2018, *Australian and New Zealand Guidelines for Fresh and Marine Water Quality.*

> Australian Standard AS 4482.1-2005 *Guide to the investigation and sampling of sites with potentially contaminated soils, Part 1 - Non-volatile and semi-volatile compounds*[1].

[1] AS 4482.1-2005 is currently 'Withdrawn', but the assessment will consider it still to be suitable as a state of knowledge document until superseded.

> Department of Defence, Department of Energy, 2018, *Quality System Manual Schedule B15*.

> Heads of Environmental Protection Authority's Australia and New Zealand (HEPA), 2020, *PFAS National Environmental Management Plan (NEMP),* Version 2.0, January 2020.

> National Environment Protection Council (NEPC), 1999, *National Environmental Protection (Assessment of Site Contamination) Measure (as amended 2013)* (ASC NEPM).

> National Health and Medical Research Council (NHMRC), 2019, *Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water*.

> Standards Australia, 1998, AS/NZ 5667:1998 *Water Quality – Sampling, Part 1: Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples*.

> U.S. Environmental Protection Agency (EPA), 2006, '*Guidance for the Data Quality Objectives Process (EPA QA/G-4)*'.

> USEPA, 2002, '*Guidance on Environmental Data Verification and Data Validation (EPA QA/G-8)'.*

2 Scope of Work

Cardno carried out the following tasks in order to satisfy the purpose and objectives of this assessment.

2.1 Review / Revision of the SAQP

Cardno undertook a review of the SAQP (Rev1.4; Cardno, 2023) prior to commencement of sampling and completed updates to add the newly installed monitoring well MW416 to the bi-annual sampling scope to fill in the data gap and to bring the SAQP in line with the *PFAS Ongoing Monitoring Program Sampling, Analysis and Quality Plan Guidance* (2023) document. The SAQP (Cardno, 2023) will be reviewed and revised (as required) prior to the next monitoring event scheduled for October 2023.

2.2 Groundwater Monitoring

Sampling of groundwater monitoring wells was performed in general accordance with the SAQP, applying methods set out in Section 3.1 of this report. The groundwater monitoring wells scheduled for sampling as part of the OMP May 2023 biannual sampling event are presented in Table 2-1, and are shown in Figure 3, Appendix A. Additional groundwater monitoring wells were gauged but not sampled for the purpose of assessing groundwater flow (see Figure 2, Appendix A).

Table 2-1 Groundwater Monitoring Locations

Catchment	Sampling Frequency	Location (On-Site/ Off-Site)	Number of Monitoring Locations	Monitoring Well / Bore ID
Jack in the Box Creek	Biannual	On-Site	4	MW304, MW307, MW312, MW416[1].
		Off-Site	2	MW360, MW361.
Kiewa River	Biannual	On-Site	24	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_I, MW046_D, MW052, MW342, MW345, MW346, MW350_S, MW350_D, MW351, MW352, MW353, MW354, MW403 and MW404.
		Off-Site	3	MW356, MW357, OTH019.

1. MW416 replaced MW326 in May 2023 due to unrepairable damage of MW326 rendering the well unable to be sampled. MW416 was sampled in the May event and will be again in the August-October event (normal frequency) to provide an additional data point as it could not be sampled in October 2022.

2.3 Surface Water Monitoring

Sampling of surface water locations was performed in general accordance with the SAQP, applying methods set out in Section 3.2 of this report. The surface water sampling locations monitored as part of the OMP May 2023 biannual sampling event are presented in Table 2-2, and are shown in Figure 4, Appendix A.

Table 2-2 Surface Water Monitoring Locations

Catchment	Sampling Frequency	Location (On-Site/ Off-Site)	Number of Monitoring Locations	Monitoring Location ID
Jack in the Box Creek	Biannual	On-Site	16	SW302, SW307, SW310, SW311, SW313, SW316, SW321, SW322, SW323, SW324, SW326, SW332, SW333, SW336, SW338, and SW448.
		Off-Site	7	SW424, SW427, SW430, SW431, SW432, SW434 and SW463.
Kiewa River	Biannual	On-Site	12	SW340, SW346, SW349, SW355, SW370, SW374, SW375, SW379, SW380, SW382, SW387 and SW388.
		Off-Site	18	SW390, SW393, SW395, SW396, SW397, SW398, SW400, SW401, SW403, SW404, SW405, SW409, SW412, SW416, SW462, SW470, SW471 and SW487.

2.4 Sediment Monitoring

Sampling of sediment locations was performed in general accordance with the SAQP, applying methods set out in Section 3.3 of this report. The sediment sampling locations monitored as part of the OMP May 2023 biannual sampling event are presented in Table 2-3, and are shown in Figure 5, Appendix A.

Table 2-3 Sediment Monitoring Locations and Frequency

Catchment	Sampling Frequency	Location (On-Site/ Off-Site)	Monitoring Location ID
Jack in the Box Creek	Annual (February to May)	On-Site	SD323.
		Off-Site	SD424 and SD463.
Kiewa River	Annual (February to May)	On-Site	SD346, SD355, SD375 and SD382.
		Off-Site	SD395, SD396, SD397, SD400 and SD412.

2.5 Data Management

All the data included in the report have been collected, uploaded to the ESdat database and reviewed according to the data management requirements of the Defence Contamination Management Manual (DCMM) Annex L (Defence, 2021b).

2.6 Deviations from the OMP SAQP

Deviations from the SAQP were attributed to a lack of sampling media as summarised in Table 2-4. On-Site and Off-Site sampling and testing was planned at 33 groundwater locations, 53 surface water locations and 12 sediment locations but was only completed at 33 groundwater locations 49 surface water locations and 12 sediment locations. Further details of why sampling could not be completed at some locations are provided in Table 2-4.

Table 2-4 Deviations from the SAQP

Location	Deviation	Comment/Justification	Impact on Existing Dataset
Surface Water			
SW302	Not Sampled	Location dry	Location was dry, checked after the rainfall event and was still dry. This is a potential data gap as the location has not been sampled previously as it has always been found to be dry (during DSI and OMP). However, this is not considered to have a significant impact on the dataset as the downstream locations were sampled during this event and previous events.
SW307	Not Sampled	Location dry	Location was dry, checked after the rainfall event and was still dry. This is considered to have a minor impact on the dataset as downstream On-Site locations were sampled during this event. Location last sampled in the October 2022 sampling event where results were reported above the limit of detection for PFOS+PFHxS and above the adopted drinking water criteria for PFOS+PFHxS. Location was also sampled in November 2021 (first OMP event).
SW379	Not Sampled	Location dry	Location was dry, checked after the rainfall event and was still dry. This is considered to have a minor impact on the dataset as the downstream On-Site locations were sampled during this event. Location last sampled in the October 2022 sampling event where results were reported above the limit of detection for PFOS+PFHxS and above the adopted drinking water criteria for PFOS+PFHxS. Location was also sampled in November 2021 (first OMP event).
SW388	Not Sampled	Location dry	Location was dry, checked after the rainfall event and was still dry. This is considered to have a very minor impact on the dataset as the downstream Off-Site locations were sampled during this event. Location last sampled in the October 2022 sampling event where results were reported above the limit of detection for PFOS+PFHxS and above the adopted drinking water criteria for PFOS+PFHxS. Location was also sampled in all other previous OMP events and during the DSI.

3 Methodology

3.1 Groundwater Sampling Methodology

Groundwater monitoring was undertaken as detailed in Table 3-1.

Table 3-1 Groundwater Sampling Method

Activity	Details
Dates of Field Activity	1 to 6 May 2023
Well Gauging	Standing Water Levels (SWL) were gauged using an interface probe. All wells were measured against a specified mark at the top of the well casing.
Groundwater Field Parameters	Groundwater water quality parameter field measurements (field parameters) were recorded with a water quality meter after sample collection using extra sample water from within the HydraSleeve® decanted into a clean jar. The following field parameters were recorded using a water quality meter: ▪ pH. ▪ Electrical conductivity (EC). ▪ Oxidation reduction potential (ORP). ▪ Dissolved oxygen (DO). ▪ Temperature. Field parameters measured by the water quality meter were recorded on field data records. All field instruments (e.g., water quality meter) were calibrated by the equipment supplier and/or trained Cardno staff to optimise the accuracy of the measurements taken. Bump tests were also completed daily by field staff during the monitoring event. Calibration certificates and bump test records are provided in Appendix D.
Deployment of HydraSleeve®	The HydraSleeves® were deployed with attached weights in order for sample collection to begin at the lowest point of the well screen. All existing HydraSleeves® which had not been redeployed during the October 2022 event were replaced during the initial gauging round on 3 May 2023. HydraSleeve® were left in wells for a minimum of 4 hours when deployed with bottom weights only, to allow restabilisation of the well following the slight disturbance caused by sampler deployment, before sampling. For wells with a shallow water column, HydraSleeve® sampling devices were deployed with both top and bottom weights and were left in the well for a minimum of 24 hours, to allow the top weight time to compress the HydraSleeve® into the bottom of the well.
Retrieval of HydraSleeve® (Sample Collection)	Samples were collected via the continuous pull method at a rate of approximately 30 cm per second, allowing the water to pass through the check value into the sample sleeve. Samples were discharged immediately (to minimise changes in chemistry) via discharge tube.
Sample collection by bailer or tap	As per the SAQP, where insufficient water was retrieved with the HydraSleeve®, samples were collected by bailer. For bailer sampling, wells were purged until field parameters were stabilized or until dry, whichever is sooner, prior to sample collection. Where sampling of a well was required from a tap due to access constraints, the well was purged by running water from the tap for one minute prior to sample collection directly into laboratory supplied sample containers.
Decontamination procedure	New HydraSleeves® were used at each groundwater monitoring well, thus removing the need for decontamination. Where HydraSleeves® could not be used, single use bailers were used instead which also did not require decontamination. All re-usable sampling/down-hole equipment (e.g., interface probe) was thoroughly washed using PFAS & phosphate-free detergent, then double rinsed with clean water before the sample collection.

Activity	Details
Sample identification, preservation transport and holding times	Each sample was labelled with the sample location, date, project identification number and sampler's initials. Sample labelling and naming was in accordance with Annex L of the DCMM (Defence, 2021b). Samples were contained in appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under Chain of Custody (CoC) documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998 and AS 4482.1 as appropriate).
Laboratory Testing	All groundwater samples were analysed for the full PFAS analytical suite (see SAQP for full list of analytes). The primary laboratory was ALS Global Laboratories (Springvale), and the secondary laboratory (quality control) was Eurofins (Dandenong South). Both laboratories are NATA-accredited for the parameters tested. Copies of the NATA stamped laboratory reports and Chain of Custody documentation are included in Appendix C.
Laboratory Testing – Quality Control	Groundwater quality control samples were collected as follows and analysed for the full PFAS analytical suite: ▪ Field duplicate (intra-laboratory) samples at one per 10 water samples (four samples). ▪ Field triplicate (inter-laboratory) samples at one per 10 water samples (four samples). ▪ Rinsate blank samples at one per day [collected off re-used sampling/down-hole equipment] (six samples total). ▪ Trip blank samples of one per shipment included in the chilled sample containers upon transport to the laboratory (five sample total).

3.2 Surface Water Sampling Methodology

Surface water monitoring was undertaken using a grab method as detailed in Table 3-2.

Table 3-2 Surface Water Sampling Method

Item	Details
Dates of Field Activity	1 to 6 May 2023
Surface Water Field Parameters	Surface water field parameters (i.e., pH, EC, ORP, DO, and temperature) were recorded at the time of sampling using a pre-calibrated water quality meter. Field observations such as water body type, channel width, flow, turbidity, and the presence of odours, sheen, nuisance organisms, floating debris and frothing (where observed) were also recorded on field sampling sheets.
Sampling Method	Where possible, the samples were collected directly into sample containers. Where depth permits, sample bottles were positioned at least 10 cm below the surface water level and above the sediment bed and orientated with the opening facing downwards to avoid the collection of surface films. Where access to surface water samples was difficult, the samples were collected using a long-handled sampling device with a plastic container (scoop) that was lowered directly into the water body. Samples were then decanted into the laboratory-supplied sample containers. Samples were collected in accordance with Australian/New Zealand Standards (AS/NZS 5667.1:1998) '*Water quality – Sampling – Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples*'.
Decontamination	All re-usable sampling equipment (telescopic pole) were thoroughly washed using phosphate-free detergent (Liquinox), and subsequently double rinsed with clean water before the sample collection.
Sample identification, preservation, transport and holding times.	Each sample was labelled with the sample location, date, project identification number and sampler's initials. Sample labelling and naming was in accordance with Annex L of the DCMM (Defence, 2021b).

Item	Details
	Samples were contained in appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under CoC documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998 and AS 4482.1 as appropriate).
Laboratory Testing	All surface water samples were analysed for the full PFAS analytical suite (see SAQP for full list of analytes). The primary laboratory was ALS Global Laboratories (Springvale), and the secondary laboratory (quality control) was Eurofins (Dandenong South). Both laboratories are NATA-accredited for the parameters tested. Copies of the NATA stamped laboratory reports and Chain of Custody documentation are included in Appendix C.
Laboratory Testing – Quality Control	Surface water quality control samples were collected as follows and analysed for the full PFAS analytical suite: ▪ Field duplicate (intra-laboratory) samples at one per 10 water samples (five samples). ▪ Field triplicate (inter-laboratory) samples at one per 10 water samples (five samples). ▪ Rinsate blank samples at one per day [collected off re-used sampling equipment] (six samples total). ▪ Trip blank samples of one per shipment included in the chilled sample containers upon transport to the laboratory (five sample total).

3.3 Sediment Sampling Methodology

Sediment monitoring was undertaken as detailed in Table 3-3.

Table 3-3 Sediment Sampling Method

Item	Details
Dates of Field Activity	1 to 6 May 2023
Sample Collection	Sediment samples were collected from the approximate midpoint of the flow pathway and collected from the top ten centimetres after removal of the immediate surface material using the appropriate tools (e.g. hand trowel, sediment corer or hand auger), with samples placed directly into appropriately labelled, laboratory supplied sample containers and packed in chilled containers for delivery to the laboratory under CoC documentation. Sediment samples were collected after the co-located surface water sample was collected to prevent agitating sediments into the water body and surface water sample matrix. At each sampling location, the sediment sample was visually assessed and observations (physical description including makeup, colour, visible signs of contamination and moisture) recorded on field data sheets.
Decontamination	All re-usable sampling equipment (hand trowel or sediment corer) were thoroughly washed using phosphate-free detergent (Liquinox), and subsequently double rinsed with clean water before the sample collection.
Sample identification, preservation, transport and holding times.	Each sample was labelled with the sample location, date, project identification number and sampler's initials. Sample labelling and naming was in accordance with Annex L of the DCMM (Defence, 2021b). Samples were contained in appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under CoC documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998).
Laboratory Testing	All sediment samples were analysed for the full PFAS analytical suite (see SAQP for full list of analytes). The primary laboratory was ALS Global Laboratories (Springvale), and the secondary laboratory (quality control) was Eurofins (Dandenong South). Both laboratories are

Item	Details
	NATA-accredited for the parameters tested. Copies of the NATA stamped laboratory reports and CoC documentation are included in Appendix C.
Laboratory Testing – Quality Control	Sediment quality control samples were collected as follows and analysed for the full PFAS analytical suite: ▪ Field duplicate (intra-laboratory) samples at one per 10 sediment samples (two samples). ▪ Field triplicate (inter-laboratory) samples at one per 10 sediment samples (two samples). ▪ Rinsate blank samples at one per day [collected off re-used sampling equipment] (six samples total). ▪ Trip blank samples of one per shipment included in the chilled sample containers upon transport to the laboratory (five samples total).

3.4 Quality Control / Quality Assurance

A critical aspect of site assessments is the demonstration of the quality of the data used as the basis for the assessment. This is achieved through a Data Validation process which includes a review of the following data quality indicators, as described in the SAQP:

- QA documentation.
- Bias.
- Data Representativeness.
- Data Precision & Accuracy.
- Data Comparability.
- Data Set Completeness.

A detailed review of these aspects has been undertaken, the results of which are presented in Appendix E. A summary of the data validation from the QA/QC review is included in Section 4.4 below.

3.5 Assessment Criteria

3.5.1 Groundwater and Surface Water

The adopted assessment criteria for groundwater and surface water are detailed in Table 3-4.

Table 3-4 Criteria for Groundwater and Surface Water

Exposure Scenario	Adopted Assessment Criteria		Guidance
	PFHxS / PFOS	PFOA	
	µg/L		
Human Health – Surface Water Recreational	2[2]	10	PFAS NEMP (HEPA, 2020)
Human Health – Drinking Water Quality Guideline[1]	0.07[2]	0.56	PFAS NEMP (HEPA, 2020)
Ecological (99% species protection – high conservation value systems)	0.00023[3]	19	PFAS NEMP (HEPA, 2020)
Ecological (95% species protection – slightly to moderately disturbed systems)	0.13[3]	220	PFAS NEMP (HEPA, 2020)

1. Drinking Water screening guidelines have been adopted for screening purposes for Industrial Water use, Stock Water use and Agriculture/Parks/Gardens Water use.
2. Combined PFOS and PFHxS.
3. PFOS only; For 99% species protection, the criterion of 0.00023 µg/L is lower than the laboratory level of reporting (LOR), however, the PFAS NEMP (HEPA, 2020) allows for the adoption of the laboratory LOR as a screening level rather than a quantified measurement.

4 Field Observations and Results

4.1 Conditions Impacting the Sampling Event

The total rainfall recorded prior to and during the sampling event at the nearest weather station (082056)[2] is detailed in Table 4-1. The monthly rainfall (76.7 mm) recorded in the month of April 2023, prior to the event, was higher than monthly average rainfall in April of 50.4 mm from 1899 to 2022.

Table 4-1 Rainfall prior to and during the event

Date	Total Rainfall (mm)
7 days prior to event (24 April to 30 April 2023)	4.4
Day 1 of event (1 May 2023)	1.2
Day 2 of event (2 May 2023)	0.3
Day 3 of event (3 May 2023)	11.5
Day 4 of event (4 May 2023)	1.4
Day 5 of event (5 May 2023)	0
Day 6 of event (6 May 2023)	1.4

No On-Site activities with potential to impact sample collection or results were noted.

4.2 Groundwater

4.2.1 Summary of Field Observations

4.2.1.1 Water quality parameter field measurements

Stabilised water quality field parameters, water colour and turbidity observations recorded during the groundwater sampling program are presented in field sampling record sheets, included in Appendix D. Water quality field parameters for ORP at MW354 saw a decrease from 172.5 mV in October 2022 to -71.1 mV within this event, a strong sewage odour and a significant number of ants were observed within this well. Water quality field parameters for all other locations were generally consistent with previous events. Groundwater varied from clear to brown with low to high turbidity.

4.2.1.2 Groundwater Elevation and Migration

Groundwater elevation and flow direction across the three bases included in the PFAS OMP is summarised below:

- South Bandiana: Groundwater elevations observed at South Bandiana during the sampling event ranged from 160.202 mAHD at MW304 to 166.569 mAHD at MW317. Slight groundwater mounding was observed at MW329, which is consistent with previous sampling events. Groundwater flow is inferred to flow in a west to north-westerly direction toward the Jack in the Box Creek. Groundwater elevations and flow direction were generally consistent with those reported during the previous sampling events.
- North Bandiana: Groundwater elevations observed at North Bandiana during the sampling event ranged from 163.827 mAHD at MW346 to 167.315 mAHD at MW342. Groundwater flow is inferred to flow in an easterly direction toward the Kiewa River. Groundwater elevations and flow direction were generally consistent with those reported during the previous sampling events.
- East Bandiana: Groundwater elevations observed at East Bandiana during the sampling event ranged from 158.327 mAHD at MW046D to 160.836 mAHD at MW052. Groundwater flow is inferred to flow in an easterly direction toward the Kiewa River. Groundwater elevations and flow direction were generally consistent with those reported during the previous sampling events.

Groundwater elevation contours and flow directions for May 2023 are shown in Figure 2, Appendix A. Gauging data are presented in Appendix D.

[2] Climate statistics for Australian locations – summary statistics Wodonga Daily Rainfall - 082056 - Bureau of Meteorology (bom.gov.au), last accessed 10 May 2023

4.2.2 Groundwater Laboratory Results

The results of laboratory analysis have been compared against adopted assessment criteria, and are presented in Table B1, Appendix B, and summarised in Table 4-2 below. Of the 33 primary samples that were tested, PFOA was reported above the LOR in 19 samples and PFOS+PFHxS and PFOS were both reported above the LOR in 31 samples.

Table 4-2 Summary of Groundwater Results Exceeding Adopted Criteria

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR	No. Results Above Criteria	Significant Concentration Changes[3]
PFOS	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_D, MW046_I, MW052, MW304, MW307, MW312, MW342, MW345, MW346, MW350_D, MW350_S, MW351, MW352, MW353, MW354, MW357, MW360, MW361, MW403, MW404, OTH019	0.00023[2]	96.4	31	31	-
PFOA	MW052, MW307, MW350_S, MW403, MW404	0.56[1]	35.9	19	5	-
PFOS+ PFHxS	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_D, MW046_I, MW052, MW304, MW307, MW312, MW342, MW345, MW350_D, MW350_S, MW353, MW354, MW357, MW360, MW361, MW403, MW404, OTH019	0.07[1]	454	31	28	MW416 (decrease)

Note:
1. Drinking water assessment criteria
2. Ecological assessment criteria
3. Significant concentration change defined as an order of magnitude increase or decrease

Results have also been compared to available historical data. The following locations have reported a significant change in concentration for this monitoring event:

- MW416 (replacement well for MW326): comparing MW416 results to historical results from MW326, PFOS+PFHxS has decreased by one order of magnitude from a previous result of 0.29 µg/L in November 2021 to <0.01 µg/L in this event.

A summary of locations where a first-time detection, or a new exceedance of guideline values were reported is provided in Table 4-3 below. The laboratory reports are provided in Appendix C.

Table 4-3 Summary of Groundwater Results with First-time Detections or New Exceedances of Adopted Criteria

Deviation Type	Monitoring Well	PFOS+PFHxS concentration (µg/L)		PFOA concentration (µg/L)		PFOS concentration (µg/L)	
		May 2023	Previous Maximum	May 2023	Previous Maximum	May 2023	Previous Maximum
First-time detections	MW312	**0.36**	**0.16**	0.01	<0.01	**0.12**	**0.04**

Note:
Location with first-time detection of PFOS+PFHxS, PFOA or PFOS in latest monitoring round
Location with a new exceedance of lowest adopted guideline values in latest monitoring round
Bold: Exceedance of lowest adopted guideline values

Findings are summarised as follows:

- One groundwater sampling location (MW312) reported a first-time detection of PFOA.
- No groundwater samples reported a new exceedance of lowest adopted guideline values in this event.

4.2.3 Summary of Monitoring Network Condition and Repairs

The monitoring network was observed to be generally in good condition. Cardno completed works in South Bandiana to replace MW326 due to unrepairable damage rendering the well unable to be sampled. Chadwicks Geotechnical drillers decommissioned MW326 and installed new monitoring well MW416. The replacement well (MW416) was installed approximately 2.5 m away from MW326, with similar construction and depth, and screened at approximately the same depth within the Shepparton Colluvium aquifer. Prior to the sampling of MW416, the well was appropriately developed in accordance with industry standards using air-lifting and surge bailing and left to settle for 5 days prior to sampling (Cardno, 2023b). Cardno field staff observed that monitoring well MW051 appeared to have been hit by a vehicle and the standpipe was damaged. The damaged well was repaired by the drillers by replacing the standpipe and stickup monument with a flush-mounted gatic. Further details, including bore logs and well construction details, are presented under separate cover (Cardno, 2023b).

Minor damage was observed on the monument lids of MW307 and MW342. The stick up and well caps were observed to be in good condition and therefore the damage is not expected to have any impact on the wells.

No other changes to the monitoring network condition were noted.

4.3 Surface water

4.3.1 Summary of Field Observations

4.3.1.1 Water quality parameter field measurements

Stabilised water quality field parameters, water colour and turbidity observations recorded during the surface water sampling program are presented in field sampling record sheets, included in Appendix D. Field observations indicated that sampled locations generally had lower water levels and slower flow rates compared with the previous monitoring event in October 2022, due to the October event occurring shortly after heavy rainfall and flooding. SW427 and SW463 saw significant increases in ORP, SW311 and SW401 also saw considerable increases in ORP (that were less than an order of magnitude) compared to October 2022 results. SW311 saw a significant decrease in EC, SW310 also saw a considerable decrease in EC that was less than an order of magnitude compared to October 2022 results. SW424 reported a considerable increase, less than an order of magnitude, in EC values. Surface water varied from clear to brown with low to high turbidity.

4.3.2 Surface Water Laboratory Results

The results of laboratory analysis have been compared against adopted assessment criteria, presented in Table B2, Appendix B, and summarised in Table 4-4 below. Of the 49 primary samples that were tested, PFOA was reported above the LOR in 20 samples, and PFOS+PFHxS and PFOS were both reported above the LOR in 42 samples.

Table 4-4 Summary of Surface Water Results Exceeding Adopted Criteria

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR	No. Results Above Criteria	Significant Concentration Changes[3]
PFOS	SW310, SW311, SW313, SW316, SW321, SW322, SW323, SW324, SW326, SW332, SW333, SW336, SW338, SW340, SW346, SW349, SW355, SW370, SW374, SW375, SW380, SW395, SW396, SW397, SW400, SW401, SW403, SW405, SW409, SW412, SW424, SW427, SW430, SW431, SW432, SW434,	0.00023[2]	4.78	42	42	SW387 (decrease)

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR	No. Results Above Criteria	Significant Concentration Changes[3]
	SW448, SW462, SW463, SW470, SW471, SW487					
PFOA	SW336	0.56[1]	0.57	20	1	-
PFOS+ PFHxS	SW310, SW311, SW313, SW316, SW321, SW322, SW323, SW324, SW326, SW333, SW336, SW338, SW340, SW346, SW349, SW355, SW370, SW374, SW380, SW396, SW397, SW400, SW401, SW403, SW405, SW424, SW427, SW430, SW448, SW463, SW470, SW471, SW487	0.07[1]	6.2	42	33	SW332, SW387 (decrease)

Note:

1. Drinking water assessment criteria.
2. Ecological assessment criteria.
3. Significant concentration change defined as an order of magnitude increase or decrease.

Results have also been compared to available historical data. The following locations have reported a significant change in concentration for this monitoring event:

- SW332: PFOS+PFHxS has decreased by one order of magnitude from a previous result of 0.10 µg/L in October 2022 to 0.01 µg/L in this event.
- SW387: PFOS has decreased by one order of magnitude from a previous result of 0.13 µg/L in October 2022 to <0.01 µg/L in this event. PFOS+PFHxS has also decreased by one order of magnitude from a previous result of 0.26 µg/L in October 2022 to <0.01 µg/L in this event.

No first-time detections of PFOS, PFOS+PFHxS or PFOA or new exceedances of guideline values were reported. The laboratory reports are provided in Appendix C.

4.4 Sediment

4.4.1 Summary of Field Observations

Odour, colour and other observations recorded during the sediment sampling program are presented in field sampling record sheets, included in Appendix D. Field observations were generally consistent with the previous monitoring event in October 2022.

4.4.2 Laboratory Results

National assessment criteria have not been established for PFAS in sediment.

Of the 12 primary samples analysed, one sample reported PFOA concentrations above the limit of reporting, and 11 samples reported PFOS+PFHxS concentrations above the limit of reporting.

The results of laboratory analysis have been compared against historical results, presented in Table B3, Appendix B and summarised below:

- No first-time detections of PFOS, PFOS+PFHxS or PFOA were reported.
- No locations reported a significant change in concentration for this monitoring event.

4.5 Data Validation

The data validation process has concluded that there are no significant systematic errors in the data collection process. Therefore, the data set used as the basis for the surface water, groundwater and sediment assessment are considered valid and complete. A detailed Data Quality Review is included in Appendix E.

5 Summary and Conclusions

Cardno conducted the May 2023 biannual groundwater, surface water and sediment monitoring event at BMA as part of the PFAS OMP. On-Site and Off-Site sampling and testing was undertaken at 33 groundwater monitoring wells, 49 surface water locations and 12 sediment locations.

Groundwater levels were gauged in all accessible wells before sampling. Groundwater flow was interpreted be generally consistent with October 2022 with flow in a west to north-westerly direction from South Bandiana towards Jack in the Box Creek, and flow in an easterly direction from North Bandiana and East Bandiana towards the Kiewa River.

Table 5-1 Summary of Results

Activity	Details
Deviations from OMP SAQP	> Four surface water locations were not sampled due to locations being dry.
Groundwater Analytical Results	> 33 groundwater samples were collected in total. > One groundwater monitoring location (MW312) reported a first-time detection of PFOA. > No locations reported a first-time detection for PFOS or PFOS+PFHxS. > No locations reported a new exceedance of the lowest adopted assessment criteria for PFOS, PFOA or PFOS+PFHxS. > One groundwater monitoring location (MW416, replacement well for MW326) reported an order of magnitude decrease for PFOS+PFHxS compared to November 2021 when MW326 was last sampled. > All other concentrations reported during this event were generally consistent with results reported in the previous event.
Surface Water Analytical Results	> 49 surface water samples were collected in total. > No locations reported a first-time detection for PFOS, PFOS+PFHxS or PFOA. > No locations reported a new exceedance of the lowest adopted assessment criteria for PFOS, PFOA or PFOS+PFHxS. > One surface water location (SW387) reported an order of magnitude decrease for PFOS and PFOS+PFHxS compared to the previous event. > One surface water location (SW332) reported an order of magnitude decrease for PFOS+PFHxS compared to the previous event. > All other concentrations reported during this event were generally consistent with previous sampling events.
Sediment Analytical Results	> 12 sediment samples were collected in total. > No locations reported a first-time detection for PFOS+PFHxS or PFOA. > No locations reported a new exceedance of the lowest adopted assessment criteria for PFOS, PFOA or PFOS+PFHxS. > No significant concentration changes were reported, and results were generally consistent with results reported in the previous event.
Next Scheduled Monitoring Event	> The next OMP monitoring event is scheduled for October 2023. > SAQP to be reviewed and updated as required prior to the next monitoring event.

Notes

Denotes first time detection above LOR in latest monitoring round

Denotes new exceedance of lowest adopted screening criteria in latest monitoring round

Notes

Denotes first time detection above LOR in latest monitoring round

Denotes new exceedance of lowest adopted screening criteria in latest monitoring round

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each EQL multiplier range are: 30 (1 - 10 x EQL); 30 (10 - 30 x EQL); 30 (> 30 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

No. of samples analysed	: 1		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Analytical Results

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **WATER**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count		Rate (%)		Quality Control Specification
	QC	Regular	Actual	Expected	
	0				
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	13	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	13	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 129ml bottles have been tested in accordance with the QSM9.3 compliant, NATA accredited method. 60mL or 290mL bottles have been tested to the legacy QSM 9.1 aligned, NATA accredited method.
- EP231X: Poor matrix spike recovery for sample EM2308004-011 due to sample matrix interference. Confirmed by re-analysis.
- EP231X: Poor matrix spike recovery for sample EM2308134-003 due to sample matrix interference.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 90-190% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 9.3 (US DoD) requirements.

Client	: **STANTEC AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Telephone	: +6138549 9609
Project	: VIC_0445_PFASOMP	Date Samples Received	: 08-May-2023
Site	: VIC_0445_PFASOMP_PO1	Issue Date	: 15-May-2023
Sampler	: [redacted]	No. of samples received	: 9
Order number	: -	No. of samples analysed	: 9

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by LC-Electrospray-MS-MS, Negative Mode using MRM using internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to a portion of soil which is then extracted with MTBE and an ion pairing reagent. A portion of extract is exchanged into the analytical solvent mixture, combined with an equal volume reagent water and filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
QuECheRS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

	2IC Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X: Poor matrix spike recovery for sample EM2308009-002 due to sample matrix interference.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- Amendment (19/5/23): This report has been amended as a result of a request to change sample identification numbers (IDs) received from M.B on 18/5/23, for sample SD412 #29. All analysis results are as per the previous report.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2308009**	Page	: 1 of 6
Amendment	: **1**		
Client	: **STANTEC AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Telephone	: +3186549 9309
Project	: VIC_0445_PFASOMP_R8	Date Samples d eceive-	: 062May2R0R8
Site	: VIC_0445_PFASOMP_Public_Lan-	Issue Date	: 192May2R0R8
Sampler	: [redacted]	No. of samples receive-	: RQ
Or- er number	: 2	No. of samples analyse-	: RQ

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief metho- summaries an- references are also provi- e- to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagge- in the (uality Control)(CWd eport.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

MatriG **SOIL**

Compoun- 7 roup Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries

EPR81D:)n:RWFluorotelomer Sulfonic Aci- s	EMR8060092200R	0445_SD438_R8050R	**10:2 Fluorotelomer sulfonic acid (10:2 FTS)**	1R0RR32302Q	56.5 %	Q0.02180%	**Recovery less than lower data quality objective**

Analysis Holding Time Compliance

If samples are i- entifie- belo/ as having been analyse- or eGracte- outsi- e of recommen- e- hol- ing times, this shoul- be taUen into consi- eration / hen interpreting results.

This report summarizes eGraction ; preparation an- analysis times an- compares each / ith ALS recommen- e- hol- ing times)referencing YSEPA Sk 643, AP&A, AS an- NEPMW base- on the sample container provi- e- . Dates reporte- represent first - ate of eGraction or analysis an- preclu- e subsewuent - ilutions an- reruns. A listing of breaches)if anyWis provi- e- herein.

&ol- ing time for leachate metho- s)e.g. TCLPW vary accor- ing to the analytes reporte- . Assessment compares the leach - ate / ith the shortest analyte hol- ing time for the ewuivalent soil metho- . These are: organics 14 - ays, mercury R6 - ays q other metals 160 - ays. A recor- e- breach - oes not guarantee a breach for all non2volatile parameters.

&ol- ing times for ***VOC in soils*** vary accor- ing to analytes of interest. Vinyl Chlori- e an- Styrene hol- ing time is Q- aysH others 14 - ays. A recor- e- breach - oes not guarantee a breach for all VOC analytes an- shoul- be verifie- in case the reporte- breach is a false positive or Vinyl Chlori- e an- Styrene are not Uey analytes of interest;concern.

MatriG **SOIL** Evaluation: × = &ol- ing time breach H✓ = k ithin hol- ing time.

	2IC Organic C7emist	Melbourne Organics, S4ringvale, VIC

General Comments

T7e analytical 4rocedures used by ALS 7ave been develo4ed from establis7ed internationally recognised 4rocedures suc7 as t7ose 4ublis7ed by t7e USEPA, APHA, AS and NEPM. In 7ouse develo4ed 4rocedures are fully validated and are often at t7e client request.

W7ere moisture determination 7as been 4erformed, results are re4orted on a dry weig7t basis.

W7ere a re4orted less t7an (<) result is 7ig7er t7an t7e LOR, t7is may be due to 4rimary sam4le extract/digestate dilution and/or insufficient sam4le for analysis.

W7ere t7e LOR of a re4orted result differs from standard LOR, t7is may be due to 7ig7 moisture content, insufficient sam4le (reduced weig7t em4loyed) or matrix interference.

W7en sam4ling time information is not 4rovided by t7e client, sam4ling dates are s7own wit7out a time com4onent. In t7ese instances, t7e time com4onent 7as been assumed by t7e laboratory for 4rocessing 4ur4oses.

W7ere a result is required to meet com4liance limits t7e associated uncertainty must be considered. Refer to t7e ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by C7emical Abstracts Services. T7e C7emical Abstracts Service is a division of t7e American C7emical Society.
LOR = Limit of re4orting
^ = T7is result is com4uted from individual analyte detections at or above t7e level of re4orting
ø = ALS is not NATA accredited for t7ese tests.
~ = Indicates an estimated value.

- EP231X: Poor matrix s4ike recovery for sam4les EM2308009h002, due to sam4le matrix interference.
- EP231X: Sam4les EM230801+ required dilution due to matrix interferences. LOR values 7ave been adjusted accordingly.
- EP231X: Poor matrix s4ike recovery for sam4le EM230801+h050 due to sam4le matrix interference.
- EP231X hPerhand Polyfluoroalkyl Substances (PFAS): Sam4les received in 20ml or 12+ml bottles 7ave been tested in accordance wit7 t7e QSM+.3 com4liant, NATA accredited met7od. 60mL or 2+0mL bottles 7ave been tested to t7e legacy QSM +.1 aligned, NATA accredited met7od.
- EP231X: Sam4les EM230801+h013, 01+, 016, 01p, 05+, 0+p, 062, 065, 068, 0p3, 0p+, 083 4ositive results 7ave been confirmed by direct injection met7od using second container.
- EP231X: Sam4le EM230801+h0p5 required dilution due to matrix interferences. LOR values 7ave been adjusted accordingly.
- Amendment (19/+/23): T7is re4ort 7as been amended as a result of a request to c7ange sam4le identification numbers (IDs) received from M.B on 18/+/23, for sam4les MW505 (#p5) and SW38p (#82). All analysis results are as 4er t7e 4revious re4ort.
- EP231: Stable isoto4e enric7ed internal standards are added to sam4les 4rior to extraction. Target com4ounds 7ave a direct analogous internal standard wit7 t7e exce4tion of PFPeS, PFH4A, PFDS, PFTrDA and 10:2 FTS. T7ese com4ounds use an internal standard t7at is c7emically related and 7as a retention time close to t7at of t7e target com4ound. T7e DQO for internal standard res4onse is +0h1+0% of t7at establis7ed at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branc7ed PFOS isomers. T7ese 4ractices are in line wit7 recommendations in t7e National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM +.3 (US DoD) requirements.

Contact	: [redacted]	Telephone	: +6138549 9609
Project	: VIC_0445_PFASOMP_R3	Date Samples d eceive-	: 082May2R0R3
Site	: VIC_0445_PFASOMP_Base	Issue Date	: 192May2R0R3
Sampler	: [redacted]	No. of samples receive-	: 84
Or- er number	: 2	No. of samples analyse-	: 80

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief metho- summaries an- references are also provi- e- to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagge- in the Quality Control (QC) d eport.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Quality Control Samples

Analysis Holding Time Compliance

If samples are i- entifie- below as having been analyse- or extracte- outsi- e of recommen- e- hol- ing times, this shoul- be taken into consi- eration when interpreting results.

This report summarizes extraction / preparation an- analysis times an- compares each with ALS recommen- e- hol- ing times (referencing USEPA SW 846, APHA, AS an- NEPM) base- on the sample container provi- e- . Dates reporte- represent first - ate of extraction or analysis an- preclu- e subsequent - ilutions an- reruns. A listing of breaches (if any) is provi- e- herein.

Hol- ing time for leachate metho- s (e.g. TCLP) vary accor- ing to the analytes reporte- . Assessment compares the leach - ate with the shortest analyte hol- ing time for the equivalent soil metho- . These are: organics 14 - ays, mercury R8 - ays & other metals 180 - ays. A recor- e- breach - oes not guarantee a breach for all non2volatile parameters.

Hol- ing times for ***VOC in soils*** vary accor- ing to analytes of interest. Vinyl Chlori- e an- Styrene hol- ing time is 7 - ays; others 14 - ays. A recor- e- breach - oes not guarantee a breach for all VOC analytes an- shoul- be verifie- in case the reporte- breach is a false positive or Vinyl Chlori- e an- Styrene are not key analytes of interest/concern.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analyse- within the analytical lot(s) in which the submitte- sample(s) was(were) processe- . Actual rate shoul- be greater than or equal to the expecte- rate. A listing of breaches is provi- e- in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)							
Moisture Content	EA055	1	10	10.00	10.00	✓	NEPM R013 B3 & ALS QC Stan- ar-
Per2an- Polyfluoroalkyl Substances (PFAS) by LCMSMS	EPR31X	R	19	10.53	10.00	✓	NEPM R013 B3 & ALS QC Stan- ar-
Laboratory Control Samples (LCS)							
Per2an- Polyfluoroalkyl Substances (PFAS) by LCMSMS	EPR31X	1	19	5.26	5.00	✓	NEPM R013 B3 & ALS QC Stan- ar-

Brief Method Summaries

The analytical proce- ures use- by the Environmental Division have been - evelope- from establishe- internationally recognize- proce- ures such as those publishe- by the US EPA, APHA, AS an- NEPM. In house - evelope- proce- ures are employe- in the absence of - ocumente- stan- ar- s or by client request. The following report provi- es brief - escriptions of the analytical proce- ures employe- for results reporte- in the Certificate of Analysis. Sources from which ALS metho- s have been - evelope- are provi- e- within the Metho- Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric proce- ure base- on weight loss over a 1R hour - rying perio- at 1052110 - egrees C. This metho- is compliant with NEPM Sche- ule B(3).
Per2an- Polyfluoroalkyl Substances (PFAS) by LCMSMS	EPR31X	SOIL	In2house: Analysis of soils by solvent extraction followe- by LC2Electrospray2MS2MS, Negative Mo- e using Md M using internal stan- ar- quantitation. Isotopically labelle- analogues of target analytes use- as internal stan- ar- s an- surrogates are a- - e- to a portion of soil which is then extracte- with MTBE an- an ion pairing reagent. A portion of extract is exchange- into the analytical solvent mixture, combine- with an equal volume reagent water an- filtere- for analysis. Metho- proce- ures an- - ata quality objectives conform to US DoD QSM 5.3, table B215 requirements.
Per2an- Polyfluoroalkyl Substances (PFAS) by LCMSMS	EPR31X	WATEd	In2house: Analysis of fresh an- saline waters by Soli- Phase Extraction (SPE) followe- by LC2Electrospray2MS2MS, Negative Mo- e using Md M an- internal stan- ar- quantitation. Isotopically labelle- analogues of target analytes use- as internal stan- ar- s an- surrogates are a- - e- to the sample container. The entire contents are transferre- to a soli- phase extraction (SPE) cartri- ge. The sample container is successively rinse- with aliquots of the elution solvent. The elute- extract is combine- with an equal volume of reagent water an- a portion is filtere- for analysis. Metho- proce- ures an- - ata quality objectives conform to US DoD QSM 5.3, table B215 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
QuEChed S Extraction of Soli- s	Od G71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency ai- e- by the a- - ition of salts un- er aci- ic con- itions. Where relevant, interferences from co2extracte- organics are remove- with - ispersive clean2up me- ia (- SPE). The extract is either - ilute- or concentrate- an- exchange- into the analytical solvent.
Soli- Phase Extraction (SPE) for PFAS in water	Od G7R	WATEd	In2house: Isotopically labelle- analogues of target analytes use- as internal stan- ar- s an- surrogates are a- - e- to the sample container. The entire contents are transferre- to a soli- phase extraction (SPE) cartri- ge. The sample container is successively rinse- with aliquots of the elution solvent. The elute- extract is combine- with an equal volume of reagent water an- a portion is filtere- for analysis. Metho- proce- ures conform to US DoD QSM 5.3, table B215 requirements.

alsglobal.com

In 2023 ALS Springvale will be transitioning our telephony services to a different provider. During this time you may notice that the number that we call you on is not consistent with the details listed above. All of our existing numbers are being routed through temporary numbers during this time and will remain active for the entire process. Please continue to contact us via the numbers listed above, we would recommend not saving the temporary numbers to your records as they will be deleted once the transition is complete.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100 mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100 mL: Most Probable Number of organisms per 100 millilitres
CFU: Colony forming unit

Terms

APHA	American Public Health Association
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment however free tributyltin was measured and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Method Blank							
Perfluoroalkyl carboxylic acids (PFCAs)							
Perfluorobutanoic acid (PFBA)	ug/kg	< 5			5	Pass

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Turnaround time:	5 Day
Date/Time received	May 8, 2023 1:43 PM
Eurofins reference	987797

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✗	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

F3.01 Equipment Calibration Report
YSI ProPlus Water Quality Meter

This YSI ProPlus Water Quality Meter has been performance checked as per the manufacturer's guidelines[1].

Unit Type: YSI ProPlus
Serial Number: 19H102165

The unit has been checked for and comprises of the following items:

Item	Present	Damaged or Absent?
Carry case	☑	☐
Attached sensors (x4)	☑	☐
Spare Batteries	☑	☐
Connector Cable	☑	☐
Instruction Manual	☑	☐

The following tests and operational checks have been conducted on the unit:

Item	Test Completed	Test Passed
WQM unit electrodes cleaned and checked	☑	☑
Operations check (screen functions)	☑	☑
Temperature check	☑	☑

Calibration:

Sensor	Cal. Solution	Value	Reading
pH	pH: Buffer Solution 4.00	4.00	
pH	pH: Buffer Solution 7.00	7.00	
pH	pH: Buffer Solution 10.00	10.00	
Redox	Standard ORP solution	____ mV @ __ °c	____ mV @ ___°c
O_2	Ambient Air for 100% Dissolved Oxygen	100%	
O_2	Sodium Sulphite for 0% Dissolved Oxygen	0%	
Conductivity	Standard Conductivity Solution	____ µS/cm @ __ °c	____ mV @ __°c

Equipment Calibration Report

Equipment Report – TPS 90FLMV Water Quality Meter

This TPS 90FLMV Water Quality Meter (*Unit*) has been performance checked as per the manufacture's guidelines[1].

The Unit has been checked for and comprises of the following items:

Present	Damaged	Item
☒	☐	Orange carry case
☑	☐	90FLMV Unit
☐	☐	Dissolved Oxygen (YSI5739) Sensor
☐	☐	pH Sensor
☐	☐	Conductivity/ TDS/ Temperature Sensor
☐	☐	Redox (ORP) Sensor
☐	☐	Battery Charger
☐	☐	Syringe with storage solution (pH 2) for pH & ORP sensors, and a moist sponge for storage of DO sensor.
☐	☐	Instruction Manual
☐	☐	Calibration solutions kit

The following tests and operational checks have been conducted on the Unit:

Test Completed	Test Passed	Item
☐	☐	WQM Unit Cleaned & Decontaminated using Decon 90
☐	☐	Operations check (screen functions)
☐	☑	Battery Voltage <7.2 V (_____V)

The Unit has been performance checked and calibrated as follows:

Parameter	Calibration Values		
Temperature	Thermometer: 13 °C	Instrument: 12 °C	☐ Calibrated
Dissolved Oxygen	☒ 100% Saturation in Air	☐ 0.00 ppm in Na_2SO_4solution	
Conductivity	☒ 0 µS/cm	☒ 2,760 µS/cm	
pH	☒ pH 4.00	☐ pH 6.88	☒ pH 9.22

APPENDIX

E

DATA QUALITY REVIEW

Data Quality Review
Bandiana Military Area, VIC

This Appendix reviews the Quality Assurance (QA) and Quality Control (QC) documentation. Quality assurance encompasses the actions, procedures, checks and decisions undertaken to ensure sample integrity and representativeness, and the reliability and accuracy of analysis results. The QA documentation should also include an indication of the Data Quality Objectives sought in relation to each significant action, test or process involved in the Assessment.

QC activities measure the effectiveness of the QA procedures by undertaking testing, and then comparing results to previously established objectives. QC work will include the internal laboratory testing as well as results of QC samples submitted such as trip blanks and duplicates. The quality of the information and/or data is deemed satisfactory when the QC results demonstrate that agreed objectives have been met.

Cardno undertook a review of its QA/QC as part of the data validation exercise. The findings are summarised below.

QA/QC Aspects	Evidence and Evaluation
	QA Documentation
Sampling and Analysis Quality Plan and Data Quality Objectives	Cardno was engaged by Department of Defence (the client) to carry out the PFAS Ongoing Monitoring Plan (OMP) at Bandiana Military Area (the Site). The monitoring event commenced on 1 May and concluded 6 May 2023. The monitoring event was completed in general accordance with the scope and limitations presented in Cardno's Sampling and Analysis Quality Plan (SAQP) of 27 April 2023 (Our Ref: OMP002_Bandiana_ SAQP_Rev1.4). The assessment was carried out in general compliance with the following: ▪ Australian Standard AS 4482-2005 Guide to the investigation and sampling of sites with potentially contaminated soils, Part 1 - Non-volatile and semi-volatile compounds. ▪ Department of Defence (2021), Contamination Management Manual (DCMM), Annex L – Data Management, August 2019, Amended June 2021. ▪ Department of Defence (2019), Pollution Prevention Guideline - Routine Water Quality Monitoring, Department of Defence, Department of Energy, 2018, Quality System Manual Schedule B15. ▪ EPA Victoria (2009), Industrial Waste Resources Guidelines, Sampling and Analysis of Waters, Wastewaters, Soils and Wastes, Publication 701. ▪ Heads of Environmental Protection Authority's Australia and New Zealand (HEPA) (2020), PFAS National Environmental Management Plan (NEMP) Version 2.0, January 2020. ▪ National Environment Protection Council (NEPC), 1999, National Environmental Protection (Assessment of Site Contamination) Measure (as amended 2013) (ASC NEPM). ▪ National Health and Medical Research Council (NHMRC) (2019), Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water, August 2019. ▪ USEPA (2006), Guidance for the Data Quality Objectives Process (EPA QA/G-4). A quality control program was implemented during the investigation and the quality assurance procedures used have been reiterated in the report.

QA/QC Aspects	Evidence and Evaluation
	The investigation was carried out in accordance with the Safe Work method Statements (SWMS) and Health, Safety and Environment Plan (HSEP) for the Site. Detailed work plans were also provided and are outlined in the SAQP. The Data Quality Objectives were expressed in terms of the purpose of the assessment and the relevant assessment criteria.
Data Validation Report	This review constitutes a data validation review. This was supported by an Esdat generated "QAQC Checker" excel report, summarised in Tables B4 and B5, Appendix B.
Data Representativeness	
Holding Times	Groundwater and surface water sample analysis holding times were in conformance with EPA Publication IWRG701 2009 *'Sampling and Analysis of Waters, Wastewaters, Soils and Wastes*.
Background Samples	No background samples were collected as part of this assessment.
Equipment Decontamination	The decontamination methodology conducted during this investigation is documented in the body of the report, and was in general conformance with the SAQP and work plans. ▪ Reusable sampling equipment was rinsed with Liquinox® and deionised water prior to the collection of each sample.
Data Precision and Accuracy	
QC Testing – Blind Replicates (Primary Lab)	***Groundwater*** ▪ Acceptance Criteria: RPD < 30% ▪ Groundwater Samples Analysed: 33 ▪ Blind Replicate Samples Analysed: 4 ▪ Blind Replicate Analyte Pairs: 112 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 5 ▪ Percentage of Analyte Pairs Exceeding Criteria: 4.5% RPD exceedances were associated with PFAS compounds. Analyte concentrations from the primary sample and their corresponding blind replicate sample pairs were all within one order of magnitude. The majority of PFAS RPD exceedances are attributed to low concentrations of analyte pairs, where small differences can result in disproportionately large RPDs. This is not considered to impact the results of the investigation. The RPD results are presented in Table B4a, Appendix B. ***Surface water*** ▪ Acceptance Criteria: RPD < 30% ▪ Surface water Samples Analysed: 49 ▪ Blind Replicate Samples Analysed: 5 ▪ Blind Replicate Analyte Pairs: 140 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 2 ▪ Percentage of Analyte Pairs Exceeding Criteria: 1.4% RPD exceedances were associated with PFAS compounds. Analyte concentrations from the primary sample and their corresponding blind replicate sample pairs were all within one order of magnitude. The majority of PFAS RPD exceedances are attributed to low concentrations of analyte pairs. This is not considered to impact the results of the investigation. The RPD results are presented in Table B4a, Appendix B. ***Sediment*** ▪ Acceptance Criteria: RPD < 30% ▪ Sediment Samples Analysed: 12 ▪ Blind Replicate Samples Analysed: 2 ▪ Blind Replicate Analyte Pairs: 56 (excludes 'analytes' that are a summation of other analytes)

QA/QC Aspects	Evidence and Evaluation
	▪ Number of Analyte Pairs Exceeding Criteria: 1 ▪ Percentage of Analyte Pairs Exceeding Criteria: 1.8% RPD exceedances were associated with PFAS compounds. Analyte concentrations from the primary sample and their corresponding blind replicate sample pairs were all within one order of magnitude. The PFAS RPD exceedance is attributed to low concentrations of analyte pairs. This is not considered to impact the results of the investigation. The RPD results are presented in Table B4b, Appendix B.
QC Testing – Field Splits (Secondary Lab)	***Groundwater*** ▪ Acceptance Criteria: RPD < 30% ▪ Groundwater Samples Analysed: 33 ▪ Blind Replicate Samples Analysed: 4 ▪ Blind Replicate Analyte Pairs: 112 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 3 ▪ Percentage of Analyte Pairs Exceeding Criteria: 2.7% RPD exceedances were associated with PFAS compounds. The majority of PFAS RPD exceedances are likely attributed to low concentrations of analyte pairs. A number of RPD exceedances may also be attributed to interlaboratory differences, which can be common and significant, based on a study done by the Queensland Department of Environment and Science and the Victorian Environment Protection Authority (Vardy et al, 2018). Overall, these RPD exceedances are not considered to impact the results of the investigation. The RPD results are presented in Table B4a, Appendix B. ***Surface water*** ▪ Acceptance Criteria: RPD < 30% ▪ Surface water Samples Analysed: 49 ▪ Blind Replicate Samples Analysed: 5 ▪ Blind Replicate Analyte Pairs: 140 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 3 ▪ Percentage of Analyte Pairs Exceeding Criteria: 2.1% RPD exceedances were associated with PFAS compounds. The majority of PFAS RPD exceedances are likely attributed to low concentrations of analyte pairs. A number of RPD exceedances may also be attributed to interlaboratory differences, which can be common and significant, based on a study done by the Queensland Department of Environment and Science and the Victorian Environment Protection Authority (Vardy et al, 2018). Overall, these RPD exceedances are not considered to impact the results of the investigation. The RPD results are presented in Table B4a, Appendix B. ***Sediment*** ▪ Acceptance Criteria: RPD < 30% ▪ Sediment Samples Analysed: 12 ▪ Blind Replicate Samples Analysed: 2 ▪ Blind Replicate Analyte Pairs: 56 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 0 ▪ Percentage of Analyte Pairs Exceeding Criteria: 0% There were no RPD exceedances observed for PFAS compounds. The RPD results are presented in Table B4b, Appendix B.
Trip Blanks	Five (5) trip blanks were collected, and laboratory tested for PFAS. All analytes were reported below the limit of reporting (LOR). Trip blank results are presented in Table B4, Appendix B.
Laboratory Internal QC	Evidence of the laboratories internal QC testing is present and complete. Both ALS (the primary laboratory) and Eurofins-mgt performed internal QC with

QA/QC Aspects	Evidence and Evaluation
	adequate testing and mostly satisfactory results for matrix spikes, method blanks and laboratory duplicates. Exceptions include: **Report EM2308003** ▪ Laboratory Duplicates and Matrix Spikes: Less than the specification outlined in NEPM 2013 B3 and ALS QC Standard **Report EM2308004** ▪ Matrix Spike: did not determine a matrix spike recovery as the background level was in excess of spike level for select PFAS compounds, or recovery less than lower data quality objective for select PFAS compounds. ▪ Laboratory Duplicates and Matrix Spikes: Less than the specification outlined in NEPM 2013 B3 and ALS QC Standard ▪ **Report EM2308009** ▪ Matrix Spike: determined a matrix spike recovery less than lower data quality objective for select PFAS compounds. **Report EM23080015** ▪ Matrix Spike: did not determine a matrix spike recovery as the background level was in excess of spike level for select PFAS compounds, or recovery less than lower data quality objective for select PFAS compounds. ▪ Laboratory Duplicates: Less than the specification outlined in NEPM 2013 B3 and ALS QC Standard These exceptions are not considered to impact the results of the investigation.
Laboratory Method Detection Limit	Laboratory reports indicate the method detection limits were lower than the respective assessment criteria.
NATA endorsement of laboratory reports	Laboratory reports were stamped with the NATA endorsement stamp and signature. Laboratory reports are included in Appendix C of this report.
Calibration of Field Equipment	All field equipment used was calibrated by the equipment supplier. Certificates and daily bump test records are included in Appendix D of this report.
Decontamination and Equipment Blanks	Nine (9) rinsate blanks were collected during the investigation. Six rinsate blank samples were tested for PFAS which all reported a concentration below the laboratory LOR, whilst three were placed on hold. Results are shown in Table B5, Appendix B.
Data Comparability	
Full Review of Data	Once all results have been received, Cardno undertook a full review of the data for any anomalies in consideration of historical data at each location (where available), such as first-time detections or exceedances being reported at locations which have not had detections or exceedances previously. Where potentially anomalous data is identified or suspected, further confirmatory measures were undertaken such as re-extraction and reanalysis of the sample by the laboratory and/or additional data quality review. The following samples were reanalysed: MW307, MW312, QC105, SW332, SW336 and SW387. All original results were confirmed.
Standard Procedures	Fieldwork procedures are detailed in the report and followed the work methods outlined in the SAQP.
Qualified Personnel	Staff involved in managing and reviewing the project and those involved in fieldwork are qualified personnel.
Sample Integrity	Field Chain of Custody forms are included in Appendix C of this report and demonstrate sample integrity.
Data Completeness	
Completeness of Test Program	The scope of work undertaken was generally consistent with that set out in the SAQP. Variations to the SAQP are detailed in the Factual Report.

QA/QC Aspects	Evidence and Evaluation
Validity of Data Set	The data quality review indicates no significant systematic errors in the data collection process for surface water and groundwater and therefore, the data set used as the basis for the assessment is considered valid and complete.

APPENDIX

F

INFORMATION ABOUT ENVIRONMENTAL REPORTS

About Site Environmental Assessment Reports

1. Introduction

This document explains the Environmental Site Assessment (ESA) process and the context that applies to the use of Environmental Reports issued by Cardno.

2. What is an ESA?

Environmental Site Assessments (ESA) are undertaken for a range of purposes, specific to the brief issued by the client in each case. The scope may include one or a combination of any of the following:

- A factual report of the condition of a portion of the site or one aspect of an entire site.
- Assessment of the contamination levels in soil to be removed from a site – a waste classification assessment.
- Validation of the success of remediation of a site or a portion of a site.
- Provision of a professional opinion about the suitability of a site for one or more uses, in terms of its contamination status.

The scope of any ESA needs to be defined at the outset.

An ESA is not an Environmental Audit. Such audits are undertaken in accordance with the provisions of regulations enacted in various states of Australia, and are referred to as Site Audits in some jurisdictions. Statutory audits provide certification by EPA accredited auditors that a site is suitable for one or more uses. An ESA may provide similar advice but cannot be used in place of an audit if the latter is required by regulation in any instance. However in some circumstances and jurisdictions an ESA is sufficient to provide "environmental sign-off" of a site.

An ESA may be undertaken for due diligence purposes, to establish whether the site has been impacted to the extent that some beneficial uses of the site may be precluded. Due diligence audits in many cases may be completed as non-statutory Audits, although in some jurisdictions they can also be statutory audits, if defined as such at the outset.

3. The ESA Process

The Client generally initiates the ESA process by specifying a brief which identifies the specific objectives of the assessment. If not, it is the consultants' duty to so specify the ESA

In the case of an ESA to provide an opinion about the suitability of the site for use, it would be conducted in accordance with NEPM (Site Assessment). Such ESA would not commence until a thorough site history assessment (Phase 1 Assessment: to identify the potential for significant contamination at a site) is conducted. However, where the history is unclear, a broad screening of chemical parameters can be used to test environmental media. This normally includes a broad range of organic and inorganic compounds and elements, often referred to as an Environmental Screen.

(In the case of an ESA for a purpose other than to provide an opinion about the suitability of the site for use, it is not always necessary to undertake a Phase 1 assessment.)

The ESA requires sampling of soil at representative locations across the site. A NATA accredited laboratory performs the analysis of soil. It is impractical for all of the soil to be assessed. The ESA is often based on a statistical method of grid or random sampling, augmented by targeted sampling at locations known or suspected to be contaminated. Guidance on sampling strategy and density is provided in Australian Standard AS4482.1–2005. However, some considerable degree of judgement is still required in the application of any sampling and testing strategy. For example the blanket application of the "hot spot" method presented in this standard is often inappropriate given its limitations.

The field program also investigates the likelihood of contamination below the site surface. Field investigations must sample and test fill as well as the natural soils. If contamination is found then it is common for further work to be undertaken to characterise, to the extent practical, its vertical and horizontal extent. However, where fill is encountered and testing shows it to be uncontaminated, it must be realised that the heterogeneous nature of the material might mean that not all pockets of contaminated material can be detected using normal sampling regimes.

EPA guidelines for auditors, that may be relevant for an ESA, indicate the need in all cases to consider the potential for groundwater contamination in any site. This does not mean all sites need to be drilled to sample groundwater, but it is most often the case. Most hydrogeological settings and groundwater conditions are complex and vary in space and time. The condition of groundwater is investigated to identify if any beneficial use or environmental value of groundwater is precluded due to contamination.

As previously stated for soil, all groundwater at the site cannot be tested. The environmental investigations are conducted in accordance with industry standards and guidelines (e.g. EPA Vic Pub 668). This provides a level of confidence that a sufficiently comprehensive assessment of the groundwater at the site is achieved.

Where an investigation shows that groundwater is polluted, consideration should be given to assessing the risks and the need for and practicality of any clean up.

4. Environmental Assessment Report

The ESA Report details the findings of the ESA. It provides summary information on the site definition, the reasons for the assessment and other relevant facts. It reviews the scope and quality of the site investigations, laboratory testing and data analyses undertaken. These reports also present a review of the contamination status of the site, the need for any further clean up, and an opinion on the suitability of the site for a range of beneficial uses and land uses such as “residential – low density”, “commercial” etc, as appropriate.

However, as noted above, some ESA have a narrow scope such as for classification of waste soil for removal from site, and do not make conclusions on suitability of site for use.

The ESA Report generally includes copies of other documents and reports, necessary to support the assessment findings, presented as appendices. These can contain more detailed information than the body of the ESA Report. Care should be taken to also read the appended documents and the ESA report in full.

Cardno generally issues reports in electronic form (e-Report) on CD ROM. ESA Reports are issued in this format as Adobe Acrobat™ PDF files. However, a paper copy of the executive summary of the ESA Report is generally issued to the client, and others as required by the brief or by regulation.

5. Limitations of Environmental Assessment Report

The ESA Report is prepared in a manner that can be easily read by a lay person with a legitimate interest in the contamination status of the site, such as the site owner or occupier, EPA and Local Planning Authority. The ESA report is not intended for use by other parties or for other purposes. Anyone who uses the assessment report for purposes other than specified in the report, does so at their own risk.

The site should only be used for one or more of the beneficial uses and land uses identified in the ESA as suitable.

The conditions and qualifications may apply to the suitability of the site for use, and it is the responsibility of the Client to be cognizant of and accept these in accepting the report. Cardno are only responsible for the issuing of the ESA report but accepts no liability for the costs incurred in the implementation of ESA findings.

The ESA provides a “snapshot” of the site conditions at the time of the site investigation. Consequently, the report may not be valid at a later time if there has been any change to the contamination status of the site in that time. Verification of the status of the site may be required in cases where a significant time has elapsed, or site conditions have changed since the assessment and audit.

The ESA is necessarily limited by constraints such as time, cost and available information; although normal professional practice at the time has been applied with all due care to prepare the report. A necessary requirement of this process is the horizontal and vertical interpolation of data from discrete locations. However, site conditions are generally not homogenous and some discrepancies will occur between the actual and predicted results at locations not directly sampled. There is a risk that contamination may occur at the site and not be identified by a competent investigation and assessment. The approach adopted in sampling (a combination of statistically based grid and judgmental sampling) seeks to reduce, but cannot eliminate, this risk.

Where unexpected occurrences of contamination arise, subsequent to the issue of the ESA Report, Cardno should be permitted to make an interpretation of these facts in relation to the ESA Report findings. Consequently, the Client should inform Cardno and seek their opinion. Cardno accepts no liability for costs incurred due to such

unexpected occurrences, given the inherent uncertainties in the assessment process.

Cardno uses information provided by other parties as the basis for the ESA, and reliance on this information is at the discretion of Cardno. However, however Cardno cannot guarantee any of the facts, findings or conclusions presented by other parties. Cardno will not be liable for the use of information, provided by others that is subsequently found to be intentionally misleading.

The ESA Report is not and does not purport to be anything other than a contaminated land ESA. It is not a geotechnical report and bore logs reproduced are for interpretation of the likely distribution of contamination. They are not intended for geotechnical interpretations and may not be adequate for this purpose.

The ESA Report is not intended to be a comprehensive analysis of the presence and associated risk of asbestos in buildings and services. Where asbestos in buildings and services is known or likely, the report may only caution that an appropriately qualified person be engaged to undertake demolition to avoid contamination of the site.

MA	Management Area

1 Introduction

1.1 Background

Cardno was engaged by the Department of Defence ("Defence" or "the Client") to carry out the Per- and Poly-fluoroalkyl Substances (PFAS) Ongoing Monitoring Plan (OMP) at Bandiana Military Area ("the Site"). The Bandiana Military Area (BMA) is comprised of three individual properties identified as North Bandiana (Gaza Ridge Barracks), South Bandiana (Gaza Ridge Barracks) and East Bandiana (Wadsworth Barracks).

The OMP was carried out in general accordance with the scope and limitations presented in Cardno's Sampling and Analysis Quality Plan (SAQP):

> Cardno, 13 October 2023 Reference: DEF19008_OMP002, '*PFAS Ongoing Monitoring Plan Sampling and Analysis Quality Plan (SAQP) Bandiana Military Area'*, Rev 1.5.

For the purposes of this report:

> The "On-Site Monitoring Area" (the 'Site') is defined as BMA and is comprised of three individual properties identified as North Bandiana (Gaza Ridge Barracks), South Bandiana (Gaza Ridge Barracks) and East Bandiana (Wadsworth Barracks).

> The "Off-Site Monitoring Area" is defined as comprising Jack in the Box Creek to the north west of South Bandiana to its confluence with Wodonga Creek, an unnamed creek to the east of North Bandiana to its confluence with the Kiewa River, and the Kiewa River and western Kiewa River floodplain from Middle Creek in the south to north of the unnamed creek.

> The "Management Area" (MA) is defined as comprising the On-Site Monitoring Area and the Off-Site Monitoring Area.

The location of the Site (BMA), MA, the On-Site Monitoring Area and the Off-Site Monitoring Area are displayed in Figure 1 of Appendix A.

1.2 Purpose & Objectives

The objective of the OMP is to assess the changes in the nature and extent of PFAS within the environment, specifically where there is an identified potentially elevated risk to a receptor or a potential future risk to a receptor associated with Defence's historical use of Aqueous Film-Forming Foam (AFFF).

The purpose of this PFAS OMP factual report is to provide an up-to-date status of the condition of the Site as it is currently understood in relation to the most recent sampling event.

The objectives of the report are:

> To provide a succinct summary of the October 2023 sampling event and provision of analytical results with supporting tables and figures.

> To provide confirmation of the current understanding of risk.

> To provide supporting data for the assessment of management actions, where relevant.

1.3 Relevant Guidelines

This assessment has been undertaken in general accordance with applicable industry standards for a site investigation for the purpose, objectives and scope identified in this report. These standards are set out in:

> Australian and New Zealand Guidelines, 2018, *Australian and New Zealand Guidelines for Fresh and Marine Water Quality.*

> Australian Standard AS 4482.1-2005 *Guide to the investigation and sampling of sites with potentially contaminated soils, Part 1 - Non-volatile and semi-volatile compounds*[1].

[1] AS 4482.1-2005 is currently 'Withdrawn', but the assessment will consider it still to be suitable as a state of knowledge document until superseded.

> Department of Defence, Department of Energy, 2018, *Quality System Manual Schedule B15*.

> Heads of Environment Protection Authority Australia and New Zealand (HEPA), 2020, *PFAS National Environmental Management Plan (NEMP),* Version 2.0, January 2020.

> National Environment Protection Council (NEPC), 1999, *National Environmental Protection (Assessment of Site Contamination) Measure (as amended 2013)* (ASC NEPM).

> National Health and Medical Research Council (NHMRC), 2019, *Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water*.

> Standards Australia, 1998, AS/NZ 5667:1998 *Water Quality – Sampling, Part 1: Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples*.

> U.S. Environmental Protection Agency (EPA), 2006, '*Guidance for the Data Quality Objectives Process (EPA QA/G-4)*'.

> USEPA, 2002, '*Guidance on Environmental Data Verification and Data Validation (EPA QA/G-8)'.*

2 Scope of Work

Cardno carried out the following tasks in order to satisfy the purpose and objectives of this assessment.

2.1 Review / Revision of the SAQP

Cardno undertook a review of the SAQP (Rev5 Cardno, 2023) prior to commencement of sampling and completed updates to add the newly installed monitoring well MW416 to the annual sampling scope (replacement for MW326), and updated the SAQP to be in line with the *PFAS Ongoing Monitoring Program Sampling, Analysis and Quality Plan Guidance* (Cardno, 2023) document. The SAQP (Cardno, 2023) will be reviewed and revised (as required) prior to the next monitoring event scheduled for May 2024.

2.2 Groundwater Monitoring

Sampling of groundwater monitoring wells was performed in general accordance with the SAQP, applying methods set out in Section 3.1 of this report. The groundwater monitoring wells scheduled for sampling as part of the OMP October 2023 annual sampling event are presented in Table 2-1, and are shown in Figure 3, Appendix A.

Table 2-1 Groundwater Monitoring Locations

Catchment	Sampling Frequency	Location (On-Site/ Off-Site)	Number of Monitoring Locations	Monitoring Well / Bore ID
Jack in the Box Creek	Annual (August to October)	On-Site	10	MW051, MW311, MW315, MW317, MW318, MW319, MW321, MW323, MW329 and MW416.
		Off-Site	1	MW313.
	Biannual	On-Site	3	MW304, MW307 and MW312.
		Off-Site	2	MW360 and MW361.
Kiewa River	Annual (August to October)	On-Site	1	MW056.
	Biannual	On-Site	24	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_I, MW046_D, MW052, MW342, MW345, MW346, MW350_S, MW350_D,

				MW351, MW352, MW353, MW354, MW403 and MW404.
		Off-Site	3	MW356, MW357, OTH019.

2.3 Surface Water Monitoring

Sampling of surface water locations was performed in general accordance with the SAQP, applying methods set out in Section 3.2 of this report. The surface water sampling locations monitored as part of the OMP October 2023 biannual sampling event are presented in Table 2-2, and are shown in Figure 4, Appendix A.

Table 2-2 Surface Water Monitoring Locations

Catchment	Sampling Frequency	Location (On-Site/ Off-Site)	Number of Monitoring Locations	Monitoring Location ID
Jack in the Box Creek	Biannual	On-Site	16	SW302, SW307, SW310, SW311, SW313, SW316, SW321, SW322, SW323, SW324, SW326, SW332, SW333, SW336, SW338, and SW448.
		Off-Site	7	SW424, SW427, SW430, SW431, SW432, SW434 and SW463.
Kiewa River	Biannual	On-Site	12	SW340, SW346, SW349, SW355, SW370, SW374, SW375, SW379, SW380, SW382, SW387 and SW388.
		Off-Site	18	SW390, SW393, SW395, SW396, SW397, SW398, SW400, SW401, SW403, SW404, SW405, SW409, SW412, SW416, SW462, SW470, SW471 and SW487.

2.4 Data Management

All the data included in the report have been collected, uploaded to the ESdat database and reviewed according to the data management requirements of the Defence Contamination Management Manual (DCMM) Annex L (Defence, 2021b).

2.5 Deviations from the OMP SAQP

Deviations from the SAQP were attributed to a lack of sampling media and the resampling event as summarised in Table 2-3. On-Site and Off-Site sampling and testing was planned at 44 groundwater locations and 53 surface water locations but was only completed at 40 groundwater locations and 44 surface water locations. Resampling of select locations due to unexpected results occurred as a second event in November 2023. Further details are provided in Table 2-3.

Table 2-3 Deviations from the SAQP

Location	Deviation	Comment/Justification	Impact on Existing Dataset
Groundwater			
MW051	Resampled during resampling event	Resampled due to new exceedance	Location reported a new exceedance of drinking water criteria of PFOS+PFHxS. Location is downgradient from MW321 where elevated concentrations were also reported. Resampling in November 2023 was undertaken to confirm October 2023 results.
MW052	Resampled during resampling event	Resampled due to unexpected results	Location reported an increase of PFOS+PFHxS results from 19.5 µg/L in May 2023 to 174 µg/L in October 2023. Resampling in November 2023 was undertaken to confirm October 2023 results.
	Purging and resampling of well during resampling event	Unexpected results	After initial resampling in November 2023, the well was purged via bailing 3 bore volumes (30 L removed) and resampled for the second time after 24 hours.
MW056	Not Sampled	Wrong location (BH157) was mistakenly sampled instead of MW056	Nested well screened in the regional aquifer was mistakenly sampled instead of MW056 targeting the perched water. The two wells are located adjacent to each other, were of similar appearance, and the label on the gatics appeared to have worn out. This is considered to be a potential data gap as it is the only well targeting the perched groundwater in Source Area 9 and is sampled on an annual basis. However, this is considered to have a minor impact on the dataset as concentrations have previously been stable and below recreational guidance values. It is proposed to sample this location in the bi-annual April 2024 event to address the data gap. Results from BH157 are not included in this report as it is not part of the OMP.
MW315	Not Sampled	Location dry	Location was dry, no water evident with interface probe (IP). Confirmed with bailer. This is considered to be a potential data gap as all three wells targeting Source Area 2 (MW315, MW317 and MW318) were dry this event. However, downgradient on and off-site locations screened within the same aquifer were sampled during this event, allowing any migration of impacts to be monitored. Location last sampled in the November 2021 sampling event where results were reported below the laboratory limit of reporting (LOR) for PFOS+PFHxS and PFOA. Location was also sampled during the Detailed Site Investigation (Golder, 2018).
MW317	Not Sampled	Location dry	Location was dry, no water evident with IP. Confirmed with bailer. This is considered to be a potential data gap as all three wells targeting Source Area 2 (MW315, MW317 and MW318) were dry this event. However, downgradient on and off-site locations screened within the same aquifer were sampled during this event, allowing any migration of impacts to be monitored. The well has been dry historically throughout the OMP, location was last sampling during the DSI (Golder, 2018) where concentrations were reported above the LOR for PFOS+PFHxS but below health based guidance values.
MW318	Not Sampled	Location dry	Location was dry, no water evident with IP. Confirmed with bailer. This is a potential data gap as the location has not been sampled previously as it has always been found to be dry (during DSI and OMP). However, this is not considered to have a significant impact on the dataset as the downgradient locations were sampled during this event and previous events.

MW321	Resampled during resampling event	Resampled due to unexpected results	Location reported an increase of PFOS+PFHxS results from 0.75 µg/L in October 2022 to 1,180 µg/L in October 2023. Resampling in November 2023 was undertaken to confirm October 2023 results.
	Purging and resampling of well during resampling event	Unexpected results	After resampling in November 2023, the well was purged via bailing dry (30 L removed) and resampled for the second time after 24 hours.
MW359	Sampled during resampling event	Non-OMP well sampled during resampling event	DSI well MW359 was sampled during November resampling to provide additional delineation data upgradient of MW321.
Surface Water			
SW302	Not Sampled	Location dry	Location was dry. This is a potential data gap as the location has not been sampled previously as it has always been found to be dry (during DSI and OMP). However, this is not considered to have a significant impact on the dataset as the downstream locations were sampled during this event and previous events.
SW307	Not Sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as downstream On-site locations were sampled during this event. Location last sampled in the October 2022 sampling event where results were reported above the LOR, above the adopted drinking water criteria and below recreational water criteria for PFOS+PFHxS. Location was also sampled in November 2021 (first OMP event).
SW310	Not Sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as downstream On-site and off-site locations were sampled during this event. Location last sampled in the May 2023 sampling event where results were reported above the LOR, above the adopted drinking water criteria and below recreational water criteria for PFOS+PFHxS. Location was also sampled in three of the four previous OMP events.
SW311	Not Sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as downstream off-site locations were sampled during this event. Location last sampled in the May 2023 sampling event where results were reported above the LOR, above the adopted drinking water criteria and below recreational water criteria for PFOS+PFHxS. Location was also sampled in three of the four previous OMP events.
SW316	Not Sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as downstream off-site locations were sampled during this event. Location last sampled in the May 2023 sampling event where results were reported above the LOR for PFOS+PFHxS, above the adopted drinking water criteria and below recreational water criteria for PFOS+PFHxS. Location was also sampled in three of the four previous OMP events and during the DSI.
SW332	Sampled during resampling event	Location dry during initial OMP event	Location was found to be dry during the October 2023 sampling event. During the resampling event in November 2023, SW332 was observed to contain water and was sampled.

SW333	Sampled during resampling event	Location dry during initial OMP event	Location was found to be dry during the October 2023 sampling event. During the resampling event in November 2023, SW333 was observed to contain water and was sampled.
SW379	Not Sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as one downstream on-site location was sampled during this event. Location last sampled in the October 2022 sampling event where results were reported above the LOR, above the adopted drinking water criteria and below recreational water criteria for PFOS+PFHxS. Location was also sampled in November 2021 (first OMP event).
SW380	Not Sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as one downstream On-site location was sampled during this event. Location last sampled in the May 2023 sampling event where results were reported above the LOR, above the adopted drinking water criteria and below recreational water criteria for PFOS+PFHxS. Location was also sampled in three of the four previous OMP events and during the DSI.
SW388	Not Sampled	Location dry	Location was dry. This is considered to have a very minor impact on the dataset as the downstream off-site locations were sampled during this event. Location last sampled in the October 2022 sampling event where results were reported above the LOR, above the adopted drinking water criteria and below recreational water criteria for PFOS+PFHxS. Location was also sampled in all other previous OMP events and during the DSI.
SW448	Not Sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as the downstream On-site locations were sampled during this event. Location last sampled in the May 2023 sampling event where results were reported above the LOR for PFOS+PFHxS and PFOA and above the adopted drinking water criteria and recreational water criteria for PFOS+PFHxS. Location was also sampled in three of the four previous OMP events and during the DSI.

3 Methodology

3.1 Groundwater Sampling Methodology

Groundwater monitoring was undertaken as detailed in Table 3-1.

Table 3-1 Groundwater Sampling Method

Activity	Details
Dates of Field Activity	23 to 27 October 2023 and 27 to 28 November 2023[1]
Well Gauging	Standing Water Levels (SWL) were gauged using an IP. All wells were measured against a specified mark at the top of the well casing.
Groundwater Water Quality Parameters	Groundwater water quality parameter field measurements (water quality parameters s) were recorded with a water quality meter after sample collection using extra sample water from within the HydraSleeve® decanted into a clean jar. The following water quality parameters were recorded using a water quality meter: ▪ pH. ▪ Electrical conductivity (EC). ▪ Oxidation-Reduction potential (ORP). ▪ Dissolved oxygen (DO). ▪ Temperature. Water quality parameters measured by the water quality meter were recorded on field data records. All field instruments (e.g., water quality meter) were calibrated by the equipment supplier and/or trained Cardno staff to optimize the accuracy of the measurements taken. Bump tests were also completed daily by field staff during the monitoring event. Calibration certificates and bump test records are provided in Appendix D.
Deployment of HydraSleeve®	The HydraSleeves® were deployed with attached weights in order for sample collection to begin at the lowest point of the well screen. All existing HydraSleeves® which had not been redeployed during the May 2023 event were replaced during the initial gauging round on 24 October 2023. HydraSleeves® were left in wells for a minimum of 4 hours when deployed with bottom weights only, to allow restabilisation of the well following the slight disturbance caused by sampler deployment, before sampling. For wells with a shallow water column, HydraSleeve® sampling devices were deployed with both top and bottom weights and were left in the well for a minimum of 24 hours, to allow the top weight time to compress the HydraSleeve® into the bottom of the well.
Retrieval of HydraSleeve® (Sample Collection)	Samples were collected via the continuous pull method at a rate of approximately 30 cm per second, allowing the water to pass through the check valve into the sample sleeve. Samples were discharged immediately (to minimise changes in chemistry) via discharge tube.
Sample collection by bailer or tap	As per the SAQP, where insufficient water was retrieved with the HydraSleeve®, samples were collected by bailer. For bailer sampling, wells were purged until water quality parameters were stabilised or until dry, whichever is sooner, prior to sample collection. Where sampling of a well was required from a tap due to access constraints, the well was purged by running water from the tap for one minute prior to sample collection directly into laboratory supplied sample containers.
Decontamination procedure	New HydraSleeves® were used at each groundwater monitoring well, thus removing the need for decontamination. Where HydraSleeves® could not be used, single use bailers were used instead which also did not require decontamination. All re-usable sampling/down-hole equipment (e.g., IP) was thoroughly washed using PFAS & phosphate-free detergent, then double rinsed with clean water before the sample collection.

Activity	Details
Sample identification, preservation transport and holding times	Each sample was labelled with the sample location, date, project identification number and sampler's initials. Sample labelling and naming was in accordance with Annex L of the DCMM (Defence, 2021b). Samples were contained in appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under Chain of Custody (CoC) documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998 and AS 4482.1 as appropriate).
Laboratory Testing	All groundwater samples were analysed for the full PFAS analytical suite (see SAQP for full list of analytes). The primary laboratory was ALS Global Laboratories (Springvale), and the secondary laboratory (quality control) was Eurofins (Dandenong South). Both laboratories are National Association of Testing Authorities (NATA)-accredited for the parameters tested. Copies of the NATA stamped laboratory reports and CoC documentation are included in Appendix C.
Laboratory Testing – Quality Control	Groundwater quality control samples were collected as follows and analysed for the full PFAS analytical suite: ▪ Field duplicate (intra-laboratory) samples at one per 10 water samples (five samples). ▪ Field triplicate (inter-laboratory) samples at one per 10 water samples (five samples). ▪ Rinsate blank samples at one per day [collected off re-used sampling/down-hole equipment] (seven samples total). ▪ Trip blank samples of one per shipment included in the chilled sample containers upon transport to the laboratory (five samples total).
[1]Re-sampling event to confirm unexpected results from October 2023 sampling.	

3.2 Surface Water Sampling Methodology

Surface water monitoring was undertaken using a grab method as detailed in Table 3-2.

Table 3-2 Surface Water Sampling Method

Item	Details
Dates of Field Activity	23 to 27 October 2023 and 28 November 2023[1]
Surface Water Parameters	Surface water physio-chemical parameters (i.e., pH, EC, ORP, DO, and temperature) were recorded at the time of sampling using a pre-calibrated water quality meter. Field observations such as water body type, channel width, flow, turbidity, and the presence of odours, sheen, nuisance organisms, floating debris and frothing (where observed) were also recorded on field sampling sheets.
Sampling Method	Where possible, the samples were collected directly into sample containers. Where depth permits, sample bottles were positioned at least 10 cm below the surface water level and above the sediment bed and orientated with the opening facing downwards to avoid the collection of surface films. Where access to surface water samples was difficult, the samples were collected using a long-handled sampling device with a plastic container (scoop) that was lowered directly into the water body. Samples were then decanted into the laboratory-supplied sample containers. Samples were collected in accordance with Australian/New Zealand Standards (AS/NZS 5667.1:1998) '*Water quality – Sampling – Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples'*.
Decontamination	All re-usable sampling equipment (telescopic pole) were thoroughly washed using phosphate-free detergent (Liquinox), and subsequently double rinsed with clean water before the sample collection.

Item	Details
Sample identification, preservation, transport and holding times.	Each sample was labelled with the sample location, date, project identification number and sampler's initials. Sample labelling and naming was in accordance with Annex L of the DCMM (Defence, 2021b). Samples were contained in appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under CoC documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998 and AS 4482.1 as appropriate).
Laboratory Testing	All surface water samples were analysed for the full PFAS analytical suite (see SAQP for full list of analytes). The primary laboratory was ALS Global Laboratories (Springvale), and the secondary laboratory (quality control) was Eurofins (Dandenong South). Both laboratories are NATA-accredited for the parameters tested. Copies of the NATA stamped laboratory reports and CoC documentation are included in Appendix C.
Laboratory Testing – Quality Control	Surface water quality control samples were collected as follows and analysed for the full PFAS analytical suite: ▪ Field duplicate (intra-laboratory) samples at one per 10 water samples (six samples). ▪ Field triplicate (inter-laboratory) samples at one per 10 water samples (six samples). ▪ Rinsate blank samples at one per day [collected off re-used sampling equipment] (seven samples total). ▪ Trip blank samples of one per shipment included in the chilled sample containers upon transport to the laboratory (five samples total).
[1]Re-sampling event of previously dry locations from October 2023.	

3.3 Quality Control (QA) / Quality Assurance (QC)

A critical aspect of site assessments is the demonstration of the quality of the data used as the basis for the assessment. This is achieved through a Data Validation process which includes a review of the following data quality indicators, as described in the SAQP:

- QA documentation.
- Bias.
- Data Representativeness.
- Data Precision & Accuracy.
- Data Comparability.
- Data Set Completeness.

A detailed review of these aspects has been undertaken, the results of which are presented in Appendix E. A summary of the data validation from the QA/QC review is included in Section 4.4 below.

3.4 Assessment Criteria

3.4.1 Groundwater and Surface Water

The adopted assessment criteria for groundwater and surface water are detailed in Table 3-3.

Table 3-3 Criteria for Groundwater and Surface Water

Exposure Scenario	Adopted Assessment Criteria		Guidance
	PFHxS / PFOS	PFOA	
	µg/L		
Human Health – Surface Water Recreational	2[2]	10	PFAS NEMP (HEPA, 2020)

Human Health – Drinking Water Quality Guideline[1]	0.07[2]	0.56	PFAS NEMP (HEPA, 2020)
Ecological (99% species protection – high conservation value systems)	0.00023[3]	19	PFAS NEMP (HEPA, 2020)
Ecological (95% species protection – slightly to moderately disturbed systems)	0.13[3]	220	PFAS NEMP (HEPA, 2020)

1. Drinking Water screening guidelines have been adopted for screening purposes for Industrial Water use, Stock Water use and Agriculture/Parks/Gardens Water use.
2. Combined PFOS and PFHxS.
3. PFOS only; For 99% species protection, the criterion of 0.00023 µg/L is lower than the laboratory LOR, however, the PFAS NEMP (HEPA, 2020) allows for the adoption of the laboratory LOR as a screening level rather than a quantified measurement.

4 Field Observations and Results

4.1 Conditions Impacting the Sampling Event

The total rainfall recorded prior to and during the sampling event at the nearest weather station (082056)[2] is detailed in Table 4-1. The monthly rainfall (8.6 mm) recorded in the month of September 2023, prior to the event, was significantly lower than the monthly average rainfall in September of 62.6 mm from 1899 to 2022. As a result, a number of surface water locations were unable to be sampled during the event.

Table 4-1 Rainfall prior to and during the event

Date	Total Rainfall (mm)
7 days prior to event (16 October to 22 October 2023)	0
Day 1 of event (23 October 2023)	0
Day 2 of event (24 October 2023)	0
Day 3 of event 25 October 2023)	0
Day 4 of event (26 October 2023)	0.2
Day 5 of event (27 October 2023)	0

No On-Site activities with potential to impact sample collection or results were noted.

4.2 Groundwater

4.2.1 Summary of Field Observations

4.2.1.1 Water quality parameter field measurements

Stabilised water quality parameters, water colour and turbidity observations recorded during the groundwater sampling program are presented in field sampling record sheets, included in Appendix D. Water quality parameters for all locations were generally consistent with previous events. Groundwater varied from clear to brown with low to high turbidity.

4.2.1.2 Groundwater Elevation and Migration

Groundwater elevation and flow direction across the three bases included in the PFAS OMP is summarised below:

- South Bandiana: Groundwater elevations observed at South Bandiana during the sampling event ranged from 160.374 m Australian Height Datum (AHD) at MW304 to 166.685 mAHD at MW329. Slight groundwater mounding was observed at MW329, which is consistent with previous sampling events. Groundwater flow is inferred to flow in a west to north-westerly direction toward the Jack in the Box Creek. Groundwater elevations and flow direction were generally consistent with those reported during the previous sampling events.
- North Bandiana: Groundwater elevations observed at North Bandiana during the sampling event ranged from 164.432 mAHD at MW345 to 167.461 mAHD at MW342. Groundwater flow is inferred to flow in an easterly direction toward the Kiewa River. Groundwater elevations and flow direction were generally consistent with those reported during the previous sampling events.
- East Bandiana: Groundwater elevations observed at East Bandiana during the sampling event ranged from 157.740 mAHD at MW020 to 160.917 mAHD at MW052. Groundwater flow is inferred to flow in an easterly direction toward the Kiewa River. Groundwater elevations and flow direction were generally consistent with those reported during the previous sampling events.

Groundwater elevation contours and flow directions for October 2023 are shown in Figure 2, Appendix A. Gauging data are presented in Appendix D.

[2] Climate statistics for Australian locations – summary statistics Wodonga Daily Rainfall - 082056 - Bureau of Meteorology (bom.gov.au), last accessed 18 December 2023.

4.2.2 Groundwater Laboratory Results

The results of laboratory analysis have been compared against adopted assessment criteria, and are presented in Table B1, Appendix B, and summarised in Table 4-2 below. Of the 40 primary samples that were tested, PFOA was reported above the LOR in 20 samples and PFOS+PFHxS and PFOS were both reported above the LOR in 35 samples.

Table 4-2 Summary of Groundwater Results Exceeding Adopted Criteria

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR	No. Results Above Criteria	Significant Concentration Changes[3]
PFOS	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_D, MW046_I, MW051 MW052, MW307, MW311, MW312, MW313, MW319, MW321, MW329, MW342, MW345, MW350_D, MW350_S, MW351, MW352, MW353, MW354, MW357, MW359[4], MW360, MW361, MW403, MW404, OTH019	0.00023[2]	983	35	35	MW304 (decrease) MW321 (increase)
PFOA	MW009, MW052, MW307, MW321, MW350_S, MW353, MW403, MW404	0.56[1]	42.2	20	8	MW321 (increase)
PFOS+ PFHxS	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_D, MW046_I, MW051 MW052, MW307 MW312, MW319, MW321, MW329, MW342, MW345, MW350_D, MW350_S, MW353, MW354, MW359[4], MW360, MW361, MW403, MW404, OTH019	0.07[1]	1,180	35	30	MW304 (decrease) MW321 (increase)

Note:
1. Drinking water assessment criteria.
2. Ecological assessment criteria.
3. Significant concentration change defined as an order of magnitude increase or decrease.
4. Non-OMP well MW359 was sampled additionally as part of the resampling event in November 2023.

Results have also been compared to available historical data. The following locations have reported a significant change in concentration for this monitoring event:

- MW304: PFOS+PFHxS has decreased by one order of magnitude from a previous result of 0.34 µg/L in May 2023 to <0.01 µg/L in this event. PFOS has also decreased by one order of magnitude from 0.30 µg/L to <0.01 µg/L.
- MW321: PFOS+PFHxS has increased by one order of magnitude from a previous result of 0.75 µg/L in October 2022 to 1,180 µg/L in this event. PFOA has also increased by one order of magnitude from <0.01 µg/L to 11.6 µg/L. PFOS has also increased by one order of magnitude from 0.58 µg/L to 983 µg/L.

Due to inconsistent results compared to the historical concentrations at MW321 and MW052, re-sampling of these locations was undertaken on 27 and 28 November 2023. Re-sampling result for MW321 confirmed results from the October 2023 event. Initial results for MW052 reported an order of magnitude increase of PFOS+PFHxS and PFOA. Re-sampling results for MW052 confirmed the result from October 2023 event are considered anomalous and the re-sampling result aligned with historical data. Therefore, the October 2023 results are not discussed in this factual report, but results are included in Table B1, Appendix B.

A summary of locations where a first-time detection, or a new exceedance of guideline values were reported is provided in Table 4-3 below. The laboratory reports are provided in Appendix C.

Where re-sampling was undertaken the highest reported value has been adopted for the purpose of this assessment.

Table 4-3 Summary of Groundwater Results with First-time Detections or New Exceedances of Adopted Criteria

Deviation Type	Monitoring Well	PFOS+PFHxS concentration (µg/L)		PFOA concentration (µg/L)		PFOS concentration (µg/L)	
		October/ November 2023	Previous Maximum	October/November 2023	Previous Maximum	October/November 2023	Previous Maximum
New exceedance	MW051	**0.16**[1]	0.02	0.01	<0.01	**0.08**	**0.02**
New exceedance	MW321	**1,180**	**7.65**	**11.6**	0.10	**983**	**6.01**
New exceedance	MW353	**18.8**	**10.1**	**0.67**	0.33	**4.60**	**3.85**
New Exceedance	MW359	**0.26**[2]	0.03	<0.01	<0.01	**0.11**	**0.03**

Note:
Location with first-time detection of PFOS+PFHxS, PFOA or PFOS in latest monitoring round
Location with a new exceedance of lowest adopted guideline values in latest monitoring round
Bold: Exceedance of lowest adopted guideline values
1. Re-sampling value adopted
2. Non-OMP well sampled as additional data point during re-sampling event

Findings are summarised as follows:

- Two groundwater sampling locations (MW321 and MW353) reported new exceedance of PFOA assessment criteria.
- Two groundwater sampling location (MW051 and MW359) reported a new exceedance of PFOS+PFHxS assessment criteria.
- One groundwater sampling location (MW051) reported a first-time detection of PFOA in November 2023.

4.2.3 Summary of Monitoring Network Condition and Repairs

The monitoring network was observed to be generally in good condition.

Minor damage was observed on the monument lids of MW307 and MW342. The stick up and well caps were observed to be in good condition and therefore the damage is not expected to have any impact on the wells.

A fallen tree was observed at MW319 but appeared to not have impacted the condition of the well.

No other changes to the monitoring network condition were noted.

4.3 Surface water

4.3.1 Summary of Field Observations

4.3.1.1 Water quality parameter field measurements

Stabilised water quality parameters, water colour and turbidity observations recorded during the surface water sampling program are presented in field sampling record sheets, included in Appendix D. Field observations indicated:

- Sampled locations generally had lower water levels and slower flow rates compared with the previous monitoring event in May 2023, due to the low rainfall that occurred preceding and during the event.
- SW336 and SW340 saw decrease in ORP and an increase in DO compared to previous historical results.
- SW424 observed a significant decrease in EC by one order of magnitude compared to the May 2023 results.

- DO concentrations across the Site were generally lower than previous historical events.
- Water quality parameters for all other locations were generally consistent with previous events.

4.3.2 Surface Water Laboratory Results

The results of laboratory analysis have been compared against adopted assessment criteria, presented in Table B2, Appendix B, and summarised in Table 4-4 below. Of the 44 primary samples that were tested, PFOA was reported above the LOR in 22 samples, and PFOS+PFHxS and PFOS were both reported above the LOR in 35 samples.

Table 4-4 Summary of Surface Water Results Exceeding Adopted Criteria

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR	No. Results Above Criteria	Significant Concentration Changes[3]
PFOS	SW313, SW321, SW322, SW323, SW324, SW326, SW332, SW333, SW336, SW338, SW340, SW346, SW349, SW355, SW370, SW374, SW375, SW387, SW395, SW396, SW397, SW400, SW401, SW403, SW405, SW409, SW412, SW424, SW427, SW430, SW431, SW432, SW462, SW463, SW470, SW471, SW487	0.00023[2]	13.8	35	35	SW387 (increase)
PFOA	SW336	0.56[1]	1.17	22	1	-
PFOS+ PFHxS	SW313, SW321, SW322, SW323, SW324, SW326, SW332, SW333, SW336, SW338, SW340, SW346, SW349, SW355, SW370, SW374, SW375, SW387, SW395, SW396, SW397, SW400, SW401, SW403, SW405, SW409, SW424, SW427, SW430, SW432, SW462, SW463, SW470, SW471, SW487	0.07[1]	15.9	35	33	SW387 (increase)

Note:
1. Drinking water assessment criteria.
2. Ecological assessment criteria.
3. Significant concentration change defined as an order of magnitude increase or decrease.

Results have also been compared to available historical data. The following locations have reported a significant change in concentration for this monitoring event:

- SW387: PFOS has increased by one order of magnitude from a previous result of <0.01 µg/L in May 2023 to 0.14 µg/L in this event. PFOS+PFHxS has also increased by one order of magnitude from a previous result of <0.01 µg/L in May 2023 to 0.29 µg/L in this event.

No first-time detections of PFOS, PFOS+PFHxS or PFOA or new exceedances of guideline values were reported. The laboratory reports are provided in Appendix C.

4.4 Data Validation

The data validation process has concluded that there are no significant systematic errors in the data collection process. Therefore, the data set used as the basis for the surface water, groundwater and sediment assessment are considered valid and complete. A detailed Data Quality Review is included in Appendix E.

5 Summary and Conclusions

Cardno conducted the October/November 2023 annual groundwater and surface water monitoring event at BMA as part of the PFAS OMP. On-Site and Off-Site sampling and testing was undertaken at 40 groundwater monitoring wells and 44 surface water locations.

Groundwater levels were gauged in all accessible wells before sampling. Groundwater flow was interpreted be generally consistent with May 2023 with flow in a west to north-westerly direction from South Bandiana towards Jack in the Box Creek, and flow in an easterly direction from North Bandiana and East Bandiana towards the Kiewa River.

Table 5-1 Summary of Results

Activity	Details
Deviations from OMP SAQP	> 9 surface water locations were not sampled due to locations being dry. > 3 groundwater locations were not sampled due to locations being dry. > 1 groundwater location was not sampled due to misidentification of the well.
Groundwater Analytical Results	> 40 groundwater samples were collected in total during the initial sampling event. > Six groundwater samples from four locations were collected in total during the resampling event. > 2 groundwater monitoring locations (MW321 and MW353) reported a new exceedance of PFOA. > 2 groundwater monitoring location (MW051 and MW359) reported a new exceedance of PFOS+PFHxS. > 1 groundwater monitoring location (MW051) reported a first-time detection for PFOA. > No locations reported a first-time detection for PFOS or PFOS+PFHxS. > No locations reported a new exceedance of the lowest adopted assessment criteria for PFOS. > 1 groundwater monitoring location (MW304) reported an order of magnitude decrease for PFOS+PFHxS compared to May 2023. > 1 groundwater monitoring locations (MW321) reported an order of magnitude increase for PFOS+PFHxS, PFOS and PFOA compared to May 2023. > All other concentrations reported during this event were generally consistent with results reported in the previous event.
Surface Water Analytical Results	> 44 surface water samples were collected in total during the initial sampling event. > 2 surface water samples were collected in total during the resampling event. > No locations reported a first-time detection for PFOS, PFOS+PFHxS or PFOA. > No locations reported a new exceedance of the lowest adopted assessment criteria for PFOS, PFOA or PFOS+PFHxS. > 1 surface water location (SW387) reported an order of magnitude increase for PFOS and PFOS+PFHxS compared to the previous event. > All other concentrations reported during this event were generally consistent with previous sampling events.
Next Scheduled Monitoring Event	> The next OMP monitoring event is scheduled for May 2024. > SAQP to be reviewed and updated as required prior to the next monitoring event.

*RPDs have only been considered where a concentration is greater than 1 times the EQL.

**Elevated RPDs are highlighted as per QAQC Profile settings (Acceptable RPDs for each E
(1 - 10 x EQL); 50 (10 - 30 x EQL); 30 (> 30 x EQL))

***Interlab Duplicates are matched on a per compound basis as methods vary between labc
the row header relate to those used in the primary laboratory

Company name:	Stantec Australia Pty Ltd (VIC)
Contact name:	[redacted]
Project name:	VIC_0445_PFASOMP_23
Project ID:	Not provided
Turnaround time:	5 Day
Date/Time received	Nov 29, 2023 5:29 PM
Eurofins reference	1049115

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✗	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

[redacted]

Results will be delivered electronically via email to [redacted]

Note: A copy of these results will also be delivered to the general Stantec Australia Pty Ltd (VIC) email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Per- and Polyfluoroalkyl Substances (PFASs)			
Perfluoroalkyl carboxylic acids (PFCAs)	Melbourne	Nov 30, 2023	28 Days
- Method: LTM-ORG-2100 Per- and Polyfluoroalkyl Substances (PFAS)			
Perfluoroalkyl sulfonamido substances	Melbourne	Nov 30, 2023	28 Days

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry weight basis unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion unless otherwise stated.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with blue colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is 7 days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg milligrams per kilogram
mg/L milligrams per litre
ppm parts per million
µg/L micrograms per litre
ppb parts per billion
% Percentage
org/100 mL Organisms per 100 millilitres
NTU Nephelometric Turbidity Units
MPN/100 mL Most Probable Number of organisms per 100 millilitres
CFU Colony forming unit
Colour Pt-Co Units

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a similar compound to the analyte target is reported as percentage recovery. See below for acceptance criteria.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however, free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6 2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should only be used as a guide and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is ≤30%; however, the following acceptance guidelines are equally applicable:

Results <10 times the LOR:	No Limit
Results between 10-20 times the LOR:	RPD must lie between 0-50%
Results >20 times the LOR:	RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%, VOC recoveries 70 – 130%

PFAS field samples containing surrogate recoveries above the QC limit designated in QSM 5.4, where no positive PFAS results have been reported or reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term " NT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Final Report – this report replaces any previously issued Report

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follow guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013. They are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry weight basis unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion unless otherwise stated.
4. For CEC results where the sample's origin is unknown or environmentally contaminated, the results should be used advisedly.
5. Actual LORs are matrix dependent. Quoted LORs may be raised where sample extracts are diluted due to interferences.
6. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
7. SVOC analysis on waters is performed on homogenised, unfiltered samples unless noted otherwise.
8. Samples were analysed on an 'as received' basis.
9. Information identified in this report with blue colour indicates data provided by customers that may have an impact on the results.
10. This report replaces any interim results previously issued.

Holding Times

Please refer to the 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours before sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and despite any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling; therefore, compliance with these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether, the holding time is 7 days; however, for all other VOCs, such as BTEX or C6-10 TRH, the holding time is 14 days.

Units

mg/kg milligrams per kilogram
mg/L milligrams per litre
µg/L micrograms per litre
ppm parts per million
ppb parts per billion
% Percentage
org/100 mL Organisms per 100 millilitres
NTU Nephelometric Turbidity Units
MPN/100 mL Most Probable Number of organisms per 100 millilitres
CFU Colony forming unit

Terms

APHA	American Public Health Association
CEC	Cation Exchange Capacity
COC	Chain of Custody
CP	Client Parent - QC was performed on samples pertaining to this report
CRM	Certified Reference Material (ISO17034) - reported as percent recovery.
Dry	Where moisture has been determined on a solid sample, the result is expressed on a dry weight basis.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
LOR	Limit of Reporting.
LCS	Laboratory Control Sample - reported as percent recovery.
Method Blank	In the case of solid samples, these are performed on laboratory-certified clean sands and in the case of water samples, these are performed on de-ionised water.
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC represents the sequence or batch that client samples were analysed within.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
SRA	Sample Receipt Advice
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
TBTO	Tributyltin oxide (*bis*-tributyltin oxide) - individual tributyltin compounds cannot be identified separately in the environment; however free tributyltin was measured, and its values were converted stoichiometrically into tributyltin oxide for comparison with regulatory limits.
TCLP	Toxicity Characteristic Leaching Procedure
TEQ	Toxic Equivalency Quotient or Total Equivalence
QSM	US Department of Defense Quality Systems Manual Version 5.4
US EPA	United States Environmental Protection Agency
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6 2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site-specific Sampling Analysis and Quality Plan (SAQP) have been implemented.

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30%; however the following acceptance guidelines are equally

applicable: Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR: RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range, not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS. SVOCs recoveries 20 – 150%

PFAS field samples that contain surrogate recoveries above the QC limit designated in QSM 5.4, where no positive PFAS results have been reported, have been reviewed, and no data was affected.

QC Data General Comments

1. Where a result is reported as less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown are not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery, the term " NT" appears against that analyte.
5. For Matrix Spikes and LCS results, a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data; thus, it is possible to have two sets of data.

Quality Control Results

Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	N/A
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within he analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at ini ial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: Poor matrix spike recovery for sample EM2319355-001 due to sample matrix interference.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at ini ial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: Poor matrix spike recovery for sample EM2319356-042 due to sample matrix interference.
- EP231X: Samples required dilution due to matrix interferences. LOR values have been adjusted accordingly.
- Amendment (20/2/24):This report has been amended following a request from Maya.B on 19/2/24 to create a split report for sample 0445_MW056_20231025 (#10). All results unchanged.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: Poor matrix spike recovery for sample EM2319355-001 due to sample matrix interference.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at ini ial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: Poor matrix spike recovery for sample EM2319355-001 due to sample matrix interference.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at ini ial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

F3.04 – Groundwater Monitoring Bore Development Record

Project Details	
Project Name: Bandiana	Job Number: DEF19008
Site Address: BMA	PP/PM: BW/MB
Client Company/Contact: Defence	Date:
Persons Present: MB	Notes By: MB

Field Data

Bore Information (attach bore log)

Bore Number:	Drilled Depth (m BGL):
Screen Interval (m BGL):	Stick-up (m):
Other Observations:	

Pre Purge Information

PSH Top (m TOC): -	PSH Bottom (m TOC): -
Standing Water Level (m TOC): 7.698	Well Depth (measured) (m TOC): 9.74
Water column (m):	

Well Volume Estimation (see WI3.04 'Field Calculation of GW Bore Volumes' for accurate calcs)

Drilled/ Casing Diameter	100/25 (mm)	125/50 (mm)	150/50 (mm)	250/100 (mm)
Conversion Factor	2.7	5.1	6.7	20

Well Volume (L) = water column x conversion factor 2.042 × 5.1 = 10.2L

Development Record

3 Bore Volumes Removed: Yes/No: Purged Water Clear: Yes/No

Development Method (Disposable Bailer; S/Steel Bailer; Submersible Pump; Waterra; Waterra with Surge Block; Air; Other – Specify):

Volume Removed (L)	*SWL (mTOC)*	*Time*	*Comments (e.g. colour, turbidity, odour, water quality parameters)*
0 L			Clear
10 L			Cloudy,
20 L			Cloudy
30 L			Clear

30L = **Total Volume Removed**

Equipment Calibration Report

YSI ProPlus Water Quality Meter

This YSI ProPlus Water Quality Meter has been performance checked as per the manufacturer's guidelines[1].

Unit Type: YSI ProPlus / YSI ProPlus Quattro

Serial Number: _____

The unit has been checked for and comprises of the following items:

Item	Present	Damaged or Absent
Carry case	☑	☐
Attached sensors (x4)	☑	☐
Spare Batteries	☑	☐
Connector Cable	☑	☐
Instruction Manual	☑	☐

The following tests and operational checks have been conducted on the unit:

Item	Test Completed	Test Passed
WQM unit electrodes cleaned and checked	☑	☑
Operations check (screen functions)	☑	☑
Temperature check	☑	☑

Calibration:

Sensor	Cal. Solution	Value	Reading
pH	pH: Buffer Solution 4.00	4.00	4.06
pH	pH: Buffer Solution 7.00	7.00	7.06
pH	pH: Buffer Solution 10.00	10.00	10.01
Redox	Standard ORP solution	241 mV @ 12 °c	242 mV @ 12 °c
O_2	Ambient Air for 100% Dissolved Oxygen	100%	100 %
O_2	Sodium Sulphate for 0% Dissolved Oxygen	0%	0 %
Conductivity	Standard Conductivity Solution	1880 µS/cm @ 25 °c	1880 µS/cm @ 25 °c

DATA QUALITY REVIEW

Data Quality Review
Bandiana Military Area

This Appendix reviews the Quality Assurance (QA) and Quality Control (QC) documentation. Quality assurance encompasses the actions, procedures, checks and decisions undertaken to ensure sample integrity and representativeness, and the reliability and accuracy of analysis results. The QA documentation should also include an indication of the Data Quality Objectives sought in relation to each significant action, test or process involved in the Assessment.

QC activities measure the effectiveness of the QA procedures by undertaking testing, and then comparing results to previously established objectives. QC work will include the internal laboratory testing as well as results of QC samples submitted such as trip blanks and duplicates. The quality of the information and/or data is deemed satisfactory when the QC results demonstrate that agreed objectives have been met.

Cardno undertook a review of its QA/QC as part of the data validation exercise. The findings are summarised below.

QA/QC Aspects	Evidence and Evaluation
	QA Documentation
Sampling and Analysis Quality Plan and Data Quality Objectives	Cardno was engaged by Department of Defence (the client) to carry out the PFAS Ongoing Monitoring Plan (OMP) at Bandiana Military Area, VIC (the Site). The monitoring event was completed in October and November 2023. The monitoring event was completed in general accordance with the scope and limitations presented in Cardno's Sampling and Analysis Quality Plan (SAQP) of 13 October 2023 (Our Ref: OMP002_Bandiana_ SAQP_Rev5). The assessment was carried out in general compliance with the following: ▪ Australian Standard AS 4482-2005 (2005) Guide to the investigation and sampling of sites with potentially contaminated soils, Part 1 - Non-volatile and semi-volatile compounds (withdrawn, but referred to for state of knowledge). ▪ Department of Defence (2021), Contamination Management Manual (DCMM), Annex L – Data Management, August 2019, Amended June 2021. ▪ Department of Defence (2019), Pollution Prevention Guideline - Routine Water Quality Monitoring, Department of Defence, Department of Energy, 2018, Quality System Manual Schedule B15. ▪ EPA Victoria (2009), Industrial Waste Resources Guidelines, Sampling and Analysis of Waters, Wastewaters, Soils and Wastes, Publication 701. ▪ Heads of Environmental Protection Authority's Australia and New Zealand (HEPA) (2020), PFAS National Environmental Management Plan (NEMP) Version 2.0, January 2020. ▪ National Environment Protection Council (NEPC), 1999, National Environmental Protection (Assessment of Site Contamination) Measure (as amended 2013) (ASC NEPM). ▪ National Health and Medical Research Council (NHMRC) (2019), Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water, August 2019. ▪ USEPA (2006), Guidance for the Data Quality Objectives Process (EPA QA/G-4). A quality control program was implemented during the investigation and the quality assurance procedures used have been reiterated in the report.

QA/QC Aspects	Evidence and Evaluation
	The investigation was carried out in accordance with the Safe Work method Statements (SWMS) and Health, Safety and Environment Plan (HSEP) for the Site. Detailed work plans were also provided and are outlined in the SAQP. The Data Quality Objectives were expressed in terms of the purpose of the assessment and the relevant assessment criteria
Data Validation Report	This review constitutes a data validation review. This was supported by an Esdat generated "QAQC Checker" excel report, summarised in Tables B3 and B4, Appendix B.
Data Representativeness	
Holding Times	Groundwater and surface water analysis holding times were in conformance with EPA Publication IWRG701 2009 *'Sampling and Analysis of Waters, Wastewaters, Soils and Wastes*.
Background Samples	No background samples were collected as part of this assessment.
Equipment Decontamination	The decontamination methodology conducted during this investigation is documented in the body of the report, and was in general conformance with the SAQP. All re-usable sampling equipment was thoroughly washed using PFAS & phosphate-free detergent (Liquinox), then double rinsed with clean water before the sample collection.
Data Precision and Accuracy	
QC Testing – Blind Replicates (Primary Lab)	***Groundwater*** ▪ Acceptance Criteria: RPD < 30% ▪ Groundwater Samples Analysed: 40 ▪ Blind Replicate Samples Analysed: 5 ▪ Blind Replicate Analyte Pairs: 155 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 1 ▪ Percentage of Analyte Pairs Exceeding Criteria: 0.64% The RPD exceedances associated with PFAS compounds are considered to be minor and likely attributed to low concentrations of analyte pairs. RPD results are presented in Table B3, Appendix B. ***Surface water*** Acceptance Criteria: RPD < 30 % ▪ Surface water Samples Analysed: 42 ▪ Blind Replicate Samples Analysed: 5 ▪ Blind Replicate Analyte Pairs: 160 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 1 ▪ Percentage of Analyte Pairs Exceeding Criteria: 0.63% The RPD exceedances associated with PFAS compounds are considered to be minor and likely attributed to low concentrations of analyte pairs. RPD results are presented in Table B3, Appendix B.
QC Testing – Field Splits (Secondary Lab)	***Groundwater*** ▪ Acceptance Criteria: RPD < 30% ▪ Groundwater Samples Analysed: 40 ▪ Field Split Samples Analysed: 5 ▪ Field Split Analyte Pairs: 165 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 4

QA/QC Aspects	Evidence and Evaluation
	▪ Percentage of Analyte Pairs Exceeding Criteria: 2.42% The RPD exceedances associated with PFAS compounds are considered to be minor and likely attributed to low concentrations of analyte pairs. RPD results are presented in Table B3, Appendix B ***Surface water*** ▪ Acceptance Criteria: RPD < 30 % ▪ Surface water Samples Analysed: 42 ▪ Field Split Samples Analysed: 5 ▪ Field Split Analyte Pairs: 175 (excludes 'analytes' that are a summation of other analytes) ▪ Number of Analyte Pairs Exceeding Criteria: 2 ▪ Percentage of Analyte Pairs Exceeding Criteria: 0.11% The RPD exceedances associated with PFAS compounds are considered to be minor and likely attributed to low concentrations of analyte pairs. RPD results are presented in Table B3, Appendix B
Trip Blanks	Five (5) trip blanks were collected and laboratory tested for PFAS. All analytes were reported below the limit of reporting (LOR). Trip blank results are presented in Table B4, Appendix B.
Laboratory Internal QC	Evidence of the laboratories internal QC testing is present and complete. Both ALS (the primary laboratory) and Eurofins-mgt (the secondary laboratory) performed internal QC with adequate testing and mostly satisfactory results for matrix spikes, method blanks and laboratory duplicates.
Laboratory Method Detection Limit	Laboratory reports indicate the method detection limits were lower than the respective assessment criteria.
NATA endorsement of laboratory reports	Laboratory reports were stamped with the NATA endorsement stamp and signature. Laboratory reports are included in Appendix C of this report.
Calibration of Field Equipment	All field equipment used was calibrated by the equipment supplier. Additionally, daily bump tests were performed of the water quality meter throughout the monitoring event. Certificates are included in Appendix D of this report.
Decontamination and Equipment Blanks	All re-usable sampling equipment was thoroughly washed using PFAS & phosphate-free detergent, then double rinsed with clean water before the sample collection. Seven (7) rinsate blank samples were tested for PFAS, of which all reported PFAS concentrations below the laboratory LOR. Results are shown in Table B4, Appendix B.
Data Comparability	
Full Review of Data	Once all results have been received, Cardno undertook a full review of the data for any anomalies in consideration of historical data at each location (where available), such as first-time detections or new exceedances of adopted criteria being reported at locations which have not had detections or exceedances previously. Where potentially anomalous data is identified or suspected, further confirmatory measures were undertaken such as re-extraction and reanalysis of the sample by the laboratory and/or additional data quality review. The samples from the following monitoring locations were re-extracted and re-analysed by the laboratory: MW304, MW051, MW321, MW052, MW387 and MW462. All originally reported results were confirmed through re-extraction and re-analysis. Due to unexpected results during the initial sampling event, a second sampling event was undertaken in November 2023 to confirm the initial results. Resampling of MW321 and MW052 was taken before and after purging the wells (sampled twice in November). MW051 and MW359 were also resampled to provide additional delineation data up and down-gradient of MW321.
Standard Procedures	Fieldwork procedures are detailed in the report and followed the work methods outlined in the SAQP.

QA/QC Aspects	Evidence and Evaluation
Qualified Personnel	Staff involved in managing and reviewing the project and those involved in fieldwork are qualified personnel.
Volatile Losses	Volatile losses are not applicable to PFAS.
Sample Integrity	Field Chain of Custody forms are included in Appendix C of this report and demonstrate sample integrity.
Data Completeness	
Completeness of Test Program	The scope of work undertaken was generally consistent with that set out in the SAQP. Variations to the SAQP are detailed in the Factual Report.
Validity of Data Set	The data quality review indicates no significant systematic errors in the data collection process for surface water, groundwater or sediment and therefore, the data set used as the basis for the assessment is considered valid and complete.

APPENDIX

F

INFORMATION ABOUT ENVIRONMENTAL REPORTS

About Site Environmental Assessment Reports

1. Introduction

This document explains the Environmental Site Assessment (ESA) process and the context that applies to the use of Environmental Reports issued by Cardno now Stantec.

2. What is an ESA?

Environmental Site Assessments (ESA) are undertaken for a range of purposes, specific to the brief issued by the client in each case. The scope may include one or a combination of any of the following:

- A factual report of the condition of a portion of the site or one aspect of an entire site.
- Assessment of the contamination levels in soil to be removed from a site – a waste classification assessment.
- Validation of the success of remediation of a site or a portion of a site.
- Provision of a professional opinion about the suitability of a site for one or more uses, in terms of its contamination status.

The scope of any ESA needs to be defined at the outset.

An ESA is not an Environmental Audit. Such audits are undertaken in accordance with the provisions of regulations enacted in various states of Australia, and are referred to as Site Audits in some jurisdictions. Statutory audits provide certification by EPA accredited auditors that a site is suitable for one or more uses. An ESA may provide similar advice but cannot be used in place of an audit if the latter is required by regulation in any instance. However in some circumstances and jurisdictions an ESA is sufficient to provide "environmental sign-off" of a site.

An ESA may be undertaken for due diligence purposes, to establish whether the site has been impacted to the extent that some beneficial uses of the site may be precluded. Due diligence audits in many cases may be completed as non-statutory Audits, although in some jurisdictions they can also be statutory audits, if defined as such at the outset.

3. The ESA Process

The Client generally initiates the ESA process by specifying a brief which identifies the specific objectives of the assessment. If not, it is the consultants' duty to so specify the ESA

In the case of an ESA to provide an opinion about the suitability of the site for use, it would be conducted in accordance with NEPM (Site Assessment). Such ESA would not commence until a thorough site history assessment (Phase 1 Assessment: to identify the potential for significant contamination at a site) is conducted. However, where the history is unclear, a broad screening of chemical parameters can be used to test environmental media. This normally includes a broad range of organic and inorganic compounds and elements, often referred to as an Environmental Screen.

(In the case of an ESA for a purpose other than to provide an opinion about the suitability of the site for use, it is not always necessary to undertake a Phase 1 assessment.)

The ESA requires sampling of soil at representative locations across the site. A NATA accredited laboratory performs the analysis of soil. It is impractical for all of the soil to be assessed. The ESA is often based on a statistical method of grid or random sampling, augmented by targeted sampling at locations known or suspected to be contaminated. Guidance on sampling strategy and density is provided in Australian Standard AS4482.1–2005. However, some considerable degree of judgement is still required in the application of any sampling and testing strategy. For example the blanket application of the "hot spot" method presented in this standard is often inappropriate given its limitations.

The field program also investigates the likelihood of contamination below the site surface. Field investigations must sample and test fill as well as the natural soils. If contamination is found then it is common for further work to be undertaken to characterise, to the extent practical, its vertical and horizontal extent. However, where fill is encountered and testing shows it to be uncontaminated, it must be realised that the heterogeneous nature of the material might mean that not all pockets of contaminated material can be detected using normal sampling regimes.

EPA guidelines for auditors, that may be relevant for an ESA, indicate the need in all cases to consider the potential for groundwater contamination in any site. This does not mean all sites need to be drilled to sample groundwater, but it is most often the case. Most hydrogeological settings and groundwater conditions are complex and vary in space and time. The condition of groundwater is investigated to identify if any beneficial use or environmental value of groundwater is precluded due to contamination.

As previously stated for soil, all groundwater at the site cannot be tested. The environmental investigations are conducted in accordance with industry standards and guidelines (e.g. EPA Vic Pub 668). This provides a level of confidence that a sufficiently comprehensive assessment of the groundwater at the site is achieved.

Where an investigation shows that groundwater is polluted, consideration should be given to assessing the risks and the need for and practicality of any clean up.

4. Environmental Assessment Report

The ESA Report details the findings of the ESA. It provides summary information on the site definition, the reasons for the assessment and other relevant facts. It reviews the scope and quality of the site investigations, laboratory testing and data analyses undertaken. These reports also present a review of the contamination status of the site, the need for any further clean up, and an opinion on the suitability of the site for a range of beneficial uses and land uses such as "residential – low density", "commercial" etc, as appropriate.

However, as noted above, some ESA have a narrow scope such as for classification of waste soil for removal from site, and do not make conclusions on suitability of site for use.

The ESA Report generally includes copies of other documents and reports, necessary to support the assessment findings, presented as appendices. These can contain more detailed information than the body of the ESA Report. Care should be taken to also read the appended documents and the ESA report in full.

Cardno now Stantec generally issues reports in electronic form (e-Report) on CD ROM. ESA Reports are issued in this format as Adobe Acrobat™ PDF files. However, a paper copy of the executive summary of the ESA Report is generally issued to the client, and others as required by the brief or by regulation.

5. Limitations of Environmental Assessment Report

The ESA Report is prepared in a manner that can be easily read by a lay person with a legitimate interest in the contamination status of the site, such as the site owner or occupier, EPA and Local Planning Authority. The ESA report is not intended for use by other parties or for other purposes. Anyone who uses the assessment report for purposes other than specified in the report, does so at their own risk.

The site should only be used for one or more of the beneficial uses and land uses identified in the ESA as suitable.

The conditions and qualifications may apply to the suitability of the site for use, and it is the responsibility of the Client to be cognizant of and accept these in accepting the report. Cardno now Stantec are only responsible for the issuing of the ESA report but accepts no liability for the costs incurred in the implementation of ESA findings.

The ESA provides a "snapshot" of the site conditions at the time of the site investigation. Consequently, the report may not be valid at a later time if there has been any change to the contamination status of the site in that time. Verification of the status of the site may be required in cases where a significant time has elapsed, or site conditions have changed since the assessment and audit.

The ESA is necessarily limited by constraints such as time, cost and available information; although normal professional practice at the time has been applied with all due care to prepare the report. A necessary requirement of this process is the horizontal and vertical interpolation of data from discrete locations. However, site conditions are generally not homogenous and some discrepancies will occur between the actual and predicted results at locations not directly sampled. There is a risk that contamination may occur at the site and not be identified by a competent investigation and assessment. The approach adopted in sampling (a combination of statistically based grid and judgmental sampling) seeks to reduce, but cannot eliminate, this risk.

Where unexpected occurrences of contamination arise, subsequent to the issue of the ESA Report, Cardno now Stantec should be permitted to make an interpretation of these facts in relation to the ESA Report findings. Consequently, the Client should inform Cardno now Stantec and seek their opinion. Cardno now Stantec accepts no liability for costs incurred due to such unexpected

occurrences, given the inherent uncertainties in the assessment process.

Cardno now Stantec uses information provided by other parties as the basis for the ESA, and reliance on this information is at the discretion of Cardno now Stantec. However, however Cardno now Stantec cannot guarantee any of the facts, findings or conclusions presented by other parties. Cardno now Stantec will not be liable for the use of information, provided by others that is subsequently found to be intentionally misleading.

The ESA Report is not and does not purport to be anything other than a contaminated land ESA. It is not a geotechnical report and bore logs reproduced are for interpretation of the likely distribution of contamination. They are not intended for geotechnical interpretations and may not be adequate for this purpose.

The ESA Report is not intended to be a comprehensive analysis of the presence and associated risk of asbestos in buildings and services. Where asbestos in buildings and services is known or likely, the report may only caution that an appropriately qualified person be engaged to undertake demolition to avoid contamination of the site.

Cardno now Stantec

19 August 2022

Appendix H Summary of Sample Event Variation from OMP SAQP

Tables have been provided on the following pages detailing the sample event variations from the OMP SAQP (Stantec 2024b), generally as specified in Stantec's Factual Reports (see **Appendix C** through **Appendix G**). JBS&G commentary has been provided where relevant. Variations relating to groundwater have been provided in **Table H.1**, surface water in **Table H.2** and sediment in **Table H.3**.

©JBS&G Australia Pty Ltd

Table H.1: Deviations from OMP SAQP – Groundwater

Location	Deviation	Comments	Impact on Existing Dataset & Program
Sampling Event 1 – November 2021			
MW020	Alternate sampling method	Bailer sample due to insufficient water for HydraSleeve™ deployment.	Minimal impact – samples taken during the DSI (Golder 2018) in 2017 employed low flow micropurge air bladder pump. Sampling technique has differed however this is considered unlikely to affect the reported concentrations. JBS&G also considers this minimal impact as analytical results are similar in E1 when compared to subsequent sampling rounds where HydraSleeve™ has been used.
MW315	Alternate sampling method	Bailer sample due to insufficient water for HydraSleeve™ deployment.	No impact – last sampled in 2017 for DSI (Golder 2018) and a bailer was employed due to insufficient water for HydraSleeve™ deployment.
MW317	Not Sampled	Bore dry	Low impact – previously sampled in 2017 during the DSI (Golder 2018). Reported concentrations were above the LOR for Sum of PFHxS+PFOS and below the LOR for PFOA. Reported concentrations were below the drinking water assessment criteria reported in the 2017 sampling. The closest downgradient well MW315 (approx. 15 m northeast of MW317) reported concentrations below the LOR for PFOA and Sum of PFHxS+PFOS. Both MW315 and MW317 are located within Source Area 2. Groundwater is located greater than 20 mbgl and no groundwater extraction is occurring near Source Area 2.
MW318	Not Sampled	Bore dry	Low impact – well was dry during the DSI (Golder 2018). Downgradient well MW315 reported concentrations below the LOR for PFOA and Sum of PFHxS+PFOS. Both MW315 and MW318 are located within Source Area 2. Groundwater is located greater than 20 mbgl and no groundwater extraction is occurring nearby Source Area 2.
MW345	Alternate sampling method	Bailer sample due to insufficient water for HydraSleeve™ deployment.	Minimal impact – DSI (Golder 2018) employed low flow micropurge air bladder pump sampling technique. Sampling technique has differed however this is considered unlikely to affect the reported concentrations. JBS&G also considers this minimal impact as analytical results are similar in E1 when compared to subsequent sampling rounds where HydraSleeve™ has been used.
MW353	Alternate sampling method	Bailer sample due to insufficient water for HydraSleeve™ deployment.	Minimal impact – DSI (Golder 2018) employed low flow micropurge air bladder pump sampling technique. Sampling technique has differed however this is considered unlikely to affect the reported concentrations. JBS&G also considers this minimal impact as analytical results are similar in E1 when compared to subsequent sampling rounds where HydraSleeve™ has been used.

©JBS&G Australia Pty Ltd

Location	Deviation	Comments	Impact on Existing Dataset & Program
OTH019	Alternate sampling method	No monitoring well access, sample collected from tap following purging of bore by way of running tap for 1 minute.	No impact – First sampling of location, no historical data with differing sampling method. Ongoing sampling method is expected to be consistent. JBS&G also consider this to be no impact as this sampling method has been consistent throughout OMP.
Sampling Event 2 – May 2022			
OTH019	Alternate sampling method	No monitoring well access, sample collected from tap following purging of bore by way of running tap for 1 minute.	No impact – sample method has been consistent throughout OMP. JBS&G also consider this to be no impact as this sampling method has been consistent throughout OMP.
Sampling Event 3 – October 2022			
MW315	Not sampled	Location dry	Data gap. Well dry, no water evident with interface probe (IP). Confirmed with bailer. This is considered to have a minor impact on the dataset as downstream locations have been sampled in this event and concentrations have previously been less than the LOR. JBS&G note that this well was last sampled by bailer (as insufficient water for HydraSleeve™ deployment) in November 2021 and would be dry for all sampling events through to E5. This is considered to have a minor impact on the dataset as downgradient well MW313 was sampled during E3 and subsequent events and concentrations at MW315 have previously been less than the LOR.
MW317	Not sampled	Location dry	Data gap. Well dry, no water evident with IP. Confirmed with bailer. This is considered to have a minor impact on the dataset as the well has been dry historically, downstream locations were sampled in this event and concentrations have previously been below health based guidance values. JBS&G consider this to be low impact. MW317 would consistently be dry throughout sampling events E1 through E5 however immediately downgradient well MW315 reported concentrations below the LOR for PFOA and Sum of PFHxS+PFOS when sampled in 2017 and November 2021. Groundwater is located greater than 20 mbgl and the closest registered groundwater extraction bore is approximately 1.2 km northwest.
MW318	Not sampled	Location dry	Data gap. Well dry, no water evident with IP. Confirmed with bailer. This is considered to have a minor impact on the dataset as the well has been dry historically and never been sampled previously and downstream locations were sampled in this event. JBS&G consider this to be low impact. MW318 would consistently be dry throughout sampling events E1 through E5 however immediately downgradient well MW315

©JBS&G Australia Pty Ltd

Location	Deviation	Comments	Impact on Existing Dataset & Program
			reported concentrations below the LOR for PFOA and Sum of PFHxS+PFOS when sampled in 2017 and November 2021. Groundwater is located greater than 20 mbgl and the closest registered groundwater extraction bore is approximately 1.2 km northwest.
MW326	Not sampled	Obstruction in well	Data gap. Field crew attempted to clear the blockage again but were unsuccessful. This is considered to have a moderate impact on the dataset as well MW326 is considered to be a critical location by the Lead Consultant (JBS&G). However, wells MW325 and MW328 were sampled as replacements to provide data upgradient and downgradient of MW326. JBS&G consider this low impact given the additional sampling completed within Source Area 6. It is further noted that this location was decommissioned and replaced by installation of new well MW416 prior to the May 2023 sampling event (E4).
MW356	Not sampled	Location inaccessible/safety hazard	Data gap. Area completely flooded and a high flow from the Kiewa River made the location a safety risk. This is considered to have a minor impact on the dataset as downstream locations were sampled and concentrations have previously been below health based guidance values.
OTH019	Sampled in second visit	Location inaccessible during first event	Location was inaccessible during first event. Sampled 10 November 2022 in second visit to site. This is considered to have no impact on the dataset as the location was sampled in the second visit to site and concentrations were consistent with previous sampling.
MW313, MW319 and MW321	Gauging data not available	Due to a software malfunction, the gauging data for these three wells was lost.	This is considered to have a minor impact on the dataset as gauging data was able to be recorded for all other wells and inferred groundwater flow direction was generally consistent with previous events.
All wells	A single gauging round at the start of the event was not completed	Limited access to monitoring well locations due to training exercises occurring on-base and flooding affecting access to various areas.	This is considered to have a minor impact on the dataset. Gauging was completed across a single day within each area of the Site and the inferred groundwater flow directions were generally consistent with previous events.
Sampling Event 4 – May 2023			
No deviations from the SAQP pertaining to groundwater were identified during this sampling event.			
Sampling Event 5 – October 2023			
MW051	Resampled during resampling event	Resampled due to new exceedance	Location reported a new exceedance of drinking water criteria of Sum of PFHxS+PFOS. Location is downgradient from MW321 where elevated

©JBS&G Australia Pty Ltd

Location	Deviation	Comments	Impact on Existing Dataset & Program
			concentrations were also reported. Resampling in November 2023 was undertaken to confirm October 2023 results. JBS&G note that the November 2023 resampling result was similar to the original October 2023 result.
MW052	Resampled during resampling event	Resampled due to unexpected results	Location reported an increase of Sum of PFHxS+PFOS results from 19.5 µg/L in May 2023 to 174 µg/L in October 2023. Resampling in November 2023 was undertaken to confirm October 2023 results. JBS&G note that the November 2023 resampling result was approximately an order of magnitude less than the original October 2023 result.
	Purging and resampling of well during resampling event	Unexpected results	After initial resampling in November 2023, the well was purged via bailing 3 bore volumes (30 L removed) and resampled for the second time after 24 hours. JBS&G note that the two samples collected in November 2023 (i.e. prior to and post bailing) produced similar results.
MW056	Not Sampled	Wrong location (BH157) was mistakenly sampled instead of MW056	Nested well screened in the regional aquifer was mistakenly sampled instead of MW056 targeting the perched water. The two wells are located adjacent to each other, were of similar appearance and the label on the gatics appeared to have worn out. This is considered to be a potential data gap as it is the only well targeting the perched groundwater in Source Area 9 and is sampled on an annual basis. However, this is considered to have a minor impact on the dataset as concentrations have previously been stable and below recreational guidance values. It is proposed to sample this location in the bi-annual April 2024 event to address the data gap. Results from BH157 are not included in this report as it is not part of the OMP. JBS&G have reviewed the data from MW056 and also consider it to be relatively stable during the OMP sampling events.
MW315	Not Sampled	Location dry	Location was dry, no water evident with IP. Confirmed with bailer. This is considered to be a potential data gap as all three wells targeting Source Area 2 (MW315, MW317 and MW318) were dry this event. However, downgradient on and off-base locations screened within the same aquifer were sampled during this event, allowing any migration of impacts to be monitored. Location last sampled in the November 2021 sampling event where results were reported below the LOR for Sum of PFHxS+PFOS and PFOA. Location was also sampled during the DSI (Golder 2018). JBS&G note that this well was last sampled by bailer (as insufficient water for HydraSleeve™ deployment) in November 2021 and would be dry for all sampling events through to E5. This is considered to have a minor impact on the dataset as

©JBS&G Australia Pty Ltd

Location	Deviation	Comments	Impact on Existing Dataset & Program
			downgradient well MW313 was sampled during E3 and subsequent events and concentrations at MW315 have previously been less than the LOR.
MW317	Not Sampled	Location dry	Location was dry, no water evident with IP. Confirmed with bailer. This is considered to be a potential data gap as all three wells targeting Source Area 2 (MW315, MW317 and MW318) were dry this event. However, downgradient on and off-base locations screened within the same aquifer were sampled during this event, allowing any migration of impacts to be monitored. The well has been dry historically throughout the OMP, location was last sampling during the DSI (Golder 2018) where concentrations were reported above the LOR for Sum of PFHxS+PFOS but below health based guidance values. JBS&G consider this to be low impact. MW317 would consistently be dry throughout sampling events E1 through E5 however immediately downgradient well MW315 reported concentrations below the LOR for PFOA and Sum of PFHxS+PFOS when sampled in 2017 and November 2021. Groundwater is located greater than 20 mbgl and the closest registered groundwater extraction bore is approximately 1.2 km northwest.
MW318	Not Sampled	Location dry	Location was dry, no water evident with IP. Confirmed with bailer. This is a potential data gap as the location has not been sampled previously as it has always been found to be dry (during DSI (Golder 2018) and OMP). However, this is not considered to have a significant impact on the dataset as the downgradient locations were sampled during this event and previous events. JBS&G consider this to be low impact. MW318 would consistently be dry throughout sampling events E1 through E5 however immediately downgradient well MW315 reported concentrations below the LOR for PFOA and Sum of PFHxS+PFOS when sampled in 2017 and November 2021. Groundwater is located greater than 20 mbgl and the closest registered groundwater extraction bore is approximately 1.2 km northwest.
MW321	Resampled during resampling event	Resampled due to unexpected results	Location reported an increase of Sum of PFHxS+PFOS results from 0.75 µg/L in October 2022 to 1,180 µg/L in October 2023. Resampling in November 2023 was undertaken to confirm October 2023 results. JBS&G note that the November 2023 resampling result was approximately half the concentration of the original October 2023 result.
	Purging and resampling of well during resampling event	Unexpected results	After resampling in November 2023, the well was purged via bailing dry (30 L removed) and resampled for the second time after 24 hours. JBS&G note that the two samples collected in November 2023 (i.e. prior to and post bailing) produced similar results.

©JBS&G Australia Pty Ltd

Location	Deviation	Comments	Impact on Existing Dataset & Program
MW359	Sampled during resampling event	Non-OMP well sampled during resampling event	Well MW359 was sampled during November resampling to provide additional delineation data upgradient of MW321. JBS&G note that MW359 is located to the east of Russell Road, which is not considered to be directly down hydraulic gradient from Source Area 7, which MW321 is targeting. The low PFAS concentrations obtained from sampling MW359 is not considered to significantly assist in explaining the high result in MW321.

Table H.2: Deviations From OMP SAQP – Surface Water

Location	Deviation	Comments	Impact on Existing Dataset & Program
Sampling Event 1 – November 2021			
SW302	Not Sampled	Location dry	Low impact – location dry in 2017 during the DSI (Golder 2018). Surface water is expected to flow north. Surface water was sampled in downgradient locations SW307 and SW310. JBS&G note that SW302 would not be sampled during E1 through E5, however downgradient surface water locations SW307 and SW310 have regularly been sampled, so is considered low impact.
Sampling Event 2 – May 2022			
SW302	Not Sampled	Location dry	Data gap – This is considered to have minor impact on the monitoring program as the downstream locations were also dry during this sampling event. The location was not sampled in the previous event November 2021 as it was dry. JBS&G note that SW302 would not be sampled during E1 through E5, however downgradient surface water locations SW307 and SW310 have regularly been sampled, so is considered low impact.
SW307	Not Sampled	Location dry	Data gap – this is considered to have minor impact on the monitoring program as the location was last sampled in the November 2021 sampling event where a first-time detection and new exceedance of drinking water criteria was reported for Sum of PFHxS+PFOS. Downstream locations have been sampled in this event, noting that downstream locations are off-base. JBS&G consider this to be moderate impact to this sampling event as no data has been able to be obtained for the Source Area 2 surface water catchment, although this data has been captured during other sampling events.
SW310	Not Sampled	Location dry	
SW311	Not Sampled	Location dry	Data gap – this is considered to have minor impact on the monitoring program as the location was last sampled in the November 2021 sampling event where a first-

Location	Deviation	Comments	Impact on Existing Dataset & Program
			time detection of PFOA and Sum of PFHxS+PFOS and a new exceedance of drinking water criteria was reported for Sum of PFHxS+PFOS. Downstream locations have been sampled in this event, noting that downstream locations are off-base. JBS&G consider this to be moderate impact to this sampling event as no data has been able to be obtained for the Source Area 2 surface water catchment, although this data has been captured during other sampling events.
SW332	Not Sampled	Location dry	Data gap – this is considered to have minor impact on the monitoring program as the location was last sampled in the November 2021 sampling event where results were above the LOR, but below adopted drinking water criteria for Sum of PFHxS+PFOS. Downstream locations have been sampled in this event.
SW340	Not Sampled	Location dry	Data gap – this is considered to have minor impact on the monitoring program as the location was last sampled in the November 2021 sampling event where results were above the adopted drinking water criteria for Sum of PFHxS+PFOS and PFOA, consistent with 2017 concentrations. Downstream locations have been sampled in this event, noting that downstream locations are off-base.
SW379	Not Sampled	Location dry	Data gap – this is considered to have minor impact on the monitoring program as the location was last sampled in the November 2021 sampling event where a first-time detection of PFOA and Sum of PFHxS+PFOS and a new exceedance of drinking water criteria was reported for Sum of PFHxS+PFOS. No downstream locations present in OMP.
SW380	Not Sampled	Location dry	Data gap – this is considered to have minor impact on the monitoring program as the location was last sampled in the November 2021 sampling event where a first-time detection and new exceedance of adopted drinking water criteria was reported for Sum of PFHxS+PFOS. Downstream location (SW379) not sampled this event. JBS&G note however that further downstream on-base locations SW387 and SW388 were sampled in this event.
SW448	Not Sampled	Location dry	Data gap – this is considered to have minor impact on the monitoring program as the location was last sampled in the November 2021 sampling event where results were reported above the LOR for PFOA and Sum of PFHxS+PFOS and above the adopted drinking water criteria for Sum of PFHxS+PFOS and PFOA. Downstream locations have been sampled in this event.
Sampling Event 3 – October 2022			
SW302	Not Sampled	Location dry	Data gap. Location was dry, checked after the rainfall event and still dry. This is considered to have a minor impact on the dataset as the downstream locations

©JBS&G Australia Pty Ltd

Location	Deviation	Comments	Impact on Existing Dataset & Program
			were sampled during this event. The location has not been sampled previously as it has always been found to be dry. JBS&G note that SW302 would not be sampled during E1 through E5, however downgradient surface water locations SW307 and SW310 have regularly been sampled, so is considered low impact.
SW393	Sampled in second visit	Location inaccessible/safety hazard during first event	During initial sampling in October, the area was flooded and unsafe to access. Road had been closed due to the flood water. An aggressive brown snake was also encountered while investigating the potential to walk to the location. Location sampled 10 November in second visit to site when area was no longer flooded and safe to access. This is considered to have a minor impact on the dataset as the location was sampled in the second visit and concentrations reported are consistent with previous sampling.
SW395	Sampled in second visit	Location inaccessible/safety hazard during first event	Location unable to be sampled during initial visit due to flooding in the area. Location sampled 10 November in second visit to site when area was no longer flooded and safe to access. This is considered to have a minor impact on the dataset as the location was sampled in the second visit and while PFOS and Sum of PFHxS+PFOS concentrations have increased to a new maximum, they are still comparable and within the same order of magnitude as historical concentrations.
Sampling Event 4 – May 2023			
SW302	Not Sampled	Location dry	Location was dry, checked after the rainfall event and was still dry. This is a potential data gap as the location has not been sampled previously as it has always been found to be dry (during DSI (Golder 2018) and OMP). However, this is not considered to have a significant impact on the dataset as the downstream locations were sampled during this event and previous events. JBS&G note that SW302 would not be sampled during E1 through E5, however downgradient surface water locations SW307 and SW310 have regularly been sampled, so is considered low impact.
SW307	Not Sampled	Location dry	Location was dry, checked after the rainfall event and was still dry. This is considered to have a minor impact on the dataset as downstream on-base locations were sampled during this event. Location last sampled in the October 2022 sampling event where results were reported above the limit of detection for Sum of PFHxS+PFOS and above the adopted drinking water criteria for Sum of PFHxS+PFOS. Location was also sampled in November 2021 (E1).

©JBS&G Australia Pty Ltd

Location	Deviation	Comments	Impact on Existing Dataset & Program
SW379	Not Sampled	Location dry	Location was dry, checked after the rainfall event and was still dry. This is considered to have a minor impact on the dataset as the downstream on-base locations were sampled during this event. Location last sampled in the October 2022 sampling event where results were reported above the limit of detection for Sum of PFHxS+PFOS and above the adopted drinking water criteria for Sum of PFHxS+PFOS. Location was also sampled in November 2021 (E1).
SW388	Not Sampled	Location dry	Location was dry, checked after the rainfall event and was still dry. This is considered to have a very minor impact on the dataset as the downstream off-base locations were sampled during this event. Location last sampled in the October 2022 sampling event where results were reported above the limit of detection for Sum of PFHxS+PFOS and above the adopted drinking water criteria for Sum of PFHxS+PFOS. Location was also sampled in all other previous OMP events and during the DSI (Golder 2018).
Sampling Event 5 – October 2023			
SW302	Not sampled	Location dry	Location was dry. This is a potential data gap as the location has not been sampled previously as it has always been found to be dry (during DSI (Golder 2018) and OMP). However, this is not considered to have a significant impact on the dataset as the downstream locations were sampled during this event and previous events. JBS&G note that SW302 would not be sampled during E1 through E5, however downgradient surface water locations SW307 and SW310 have regularly been sampled, so is considered low impact.
SW307	Not sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as downstream on-base locations were sampled during this event. Location last sampled in the October 2022 sampling event where results were reported above the LOR, above the adopted drinking water criteria and below recreational water criteria for Sum of PFHxS+PFOS. Location was also sampled in November 2021 (E1).
SW310	Not sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as downstream on-base and off-base locations were sampled during this event. Location last sampled in the May 2023 sampling event where results were reported above the LOR, above the adopted drinking water criteria and below recreational water criteria for Sum of PFHxS+PFOS. Location was also sampled in three of the four previous OMP events.
SW311	Not sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as downstream off-base locations were sampled during this event. Location last sampled in the May 2023 sampling event where results were reported above the

			LOR, above the adopted drinking water criteria and below recreational water criteria for Sum of PFHxS+PFOS. Location was also sampled in three of the four previous OMP events.
SW316	Not sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as downstream off-base locations were sampled during this event. Location last sampled in the May 2023 sampling event where results were reported above the LOR for Sum of PFHxS+PFOS, above the adopted drinking water criteria and below recreational water criteria for Sum of PFHxS+PFOS. Location was also sampled in three of the four previous OMP events and during the DSI.
SW332	Sampled during resampling event	Location dry during initial OMP event	Location was found to be dry during the October 2023 sampling event. During the resampling event in November 2023, SW332 was observed to contain water and was sampled.
SW333	Sampled during resampling event	Location dry during initial OMP event	Location was found to be dry during the October 2023 sampling event. During the resampling event in November 2023, SW333 was observed to contain water and was sampled.
SW379	Not sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as one downstream on-base location was sampled during this event. Location last sampled in the October 2022 sampling event where results were reported above the LOR, above the adopted drinking water criteria and below recreational water criteria for Sum of PFHxS+PFOS. Location was also sampled in November 2021 (E1).
SW380	Not sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as one downstream on-base location was sampled during this event. Location last sampled in the May 2023 sampling event where results were reported above the LOR, above the adopted drinking water criteria and below recreational water criteria for Sum of PFHxS+PFOS. Location was also sampled in three of the four previous OMP events and during the DSI (Golder 2018).
SW388	Not sampled	Location dry	Location was dry. This is considered to have a very minor impact on the dataset as the downstream off-base locations were sampled during this event. Location last sampled in the October 2022 sampling event where results were reported above the LOR, above the adopted drinking water criteria and below recreational water criteria for Sum of PFHxS+PFOS. Location was also sampled in all other previous OMP events and during the DSI (Golder 2018).
SW448	Not sampled	Location dry	Location was dry. This is considered to have a minor impact on the dataset as the downstream on-base locations were sampled during this event. Location last sampled in the May 2023 sampling event where results were reported above the

Notes:

1. EC in µS/cm converted to TDS in mg/L by multiplying by 0.65.
2. Stantec report identifies the result for MW321 (15.21 mg/L) to be potentially anomalous, as it is not consistent with other historic values nor surrounding wells. It has been excluded from this summary table.
3. The pH value recorded for MW350_D (pH 0.27) during this sampling event is not consistent with other historic values nor surrounding wells, and as such has been excluded from this summary table.

E1	6.07 (MW356) – 6.40 (MW357)	0.72 (MW356) – 2.97 (MW357)	202 (MW357) – 529 (MW356)	131.4 (MW357) – 343.5 (MW356)	3.8 (MW357) – 166.9 (MW356)
	Slightly acidic	*Hypoxic to poor aerobic conditions*	*Freshwater*	*Freshwater*	*Moderately reducing conditions*
E2	6.36 (MW356) – 6.45 (MW357)	2.61 (MW356) – 3.34 (MW357)	156 (MW357) – 190 (MW356)	101.5 (MW357) – 123.3 (MW356)	-21.7 (MW357) – -9.9 (MW356)
	Slightly acidic	*Poor aerobic conditions*	*Freshwater*	*Freshwater*	*Anaerobic conditions*
E3[2]	5.43 (MW357)	1.07 (MW357)	112 (MW357)	73.0 (MW357)	-9.8 (MW357)
	Moderately acidic	*Hypoxic conditions*	*Freshwater*	*Freshwater*	*Anaerobic conditions*
E4	6.10 (MW357) – 6.61 (MW356)	0.70 (MW356) – 1.13 (MW357)	110 (MW356) – 186 (MW357)	71.6 (MW356) – 121.0 (MW357)	-45.7 (MW356) – -30.3 (MW357)
	Slightly acidic to neutral	*Hypoxic conditions*	*Freshwater*	*Freshwater*	*Anaerobic conditions*
E5	5.86 (MW357) – 6.61 (MW356)	1.01 (MW357) – 1.69 (MW356)	55 (MW356) – 203 (MW357)	35.8 (MW356) – 131.8 (MW357)	-61.7 (MW357) – -9.1 (MW356)
	Slightly acidic to neutral	*Hypoxic conditions*	*Freshwater*	*Freshwater*	*Anaerobic conditions*

Notes:

1. EC in µS/cm converted to TDS in mg/L by multiplying by 0.65.
2. MW356 was not sampled during this monitoring event (owing to flooding inaccessibility), so only the results from MW357 can be presented.

Table I.3: Surface Water Quality Field Parameters

Event	pH	DO (mg/L)	EC (µS/cm)	TDS (mg/L)	ORP (mV)
On-base					
E1	5.28 (SW336) – 8.96 (SW338)	2.90 (SW349) – 8.08 (SW374)	16 (SW382) – 718 (SW338)	10.1 (SW382) – 466.7 (SW338)	-37.9 (SW338) – 194.4 (SW336)
	Moderately acidic to moderately alkaline	*Poor to excellent aerobic conditions*	*Freshwater*	*Freshwater*	*Anaerobic to moderately reducing conditions*
E2	5.97 (SW370) – 8.67 (SW338)[2]	2.34 (SW375) – 8.28 (SW355)	28 (SW333) – 368 (SW338)	18.0 (SW333) – 238.9 (SW338)	-161.5 (SW321) – 216.3 (SW336)
	Strongly acidic to moderately alkaline	*Poor to excellent aerobic conditions*	*Freshwater*	*Freshwater*	*Anaerobic to oxidising conditions*
E3	5.46 (SW388) – 8.68 (SW323)	1.37 (SW311) – 9.56 (SW323)	17 (SW380) – 354 (SW111)	11.0 (SW380) – 229.8 (SW311)	-98.7 (SW311) –251.9 (SW336)
	Moderately acidic to moderately alkaline	*Hypoxic to excellent aerobic conditions*	*Freshwater*	*Freshwater*	*Anaerobic to oxidising conditions*
E4	6.06 (SW323) – 8.21 (SW338)	3.47 (SW324) – 8.97 (SW374)	18 (SW382) – 408 (SW338)	11.8 (SW382) –264.9 (SW338)	33.6 (SW374) –165.6 (SW448)
	Slightly acidic to moderately alkaline	*Poor to excellent aerobic conditions*	*Freshwater*	*Freshwater*	*Moderately reducing conditions*
E5	6.27 (SW332) – 8.51 (SW336)	2.55 (SW332) – 9.74 (SW336)	23 (SW382) – 291 (SW340)	14.7 (SW382) – 188.9 (SW340)	42.1 (SW338) – 188.6 (SW313)
	Slightly acidic to moderately alkaline	*Poor to excellent aerobic conditions*	*Freshwater*	*Freshwater*	*Moderately reducing conditions*
Off-base					
E1	6.41 (SW401) – 7.99 (SW416)	1.99 (SW398) – 8.43 (SW427)	45 (SW463) – 544 (SW396)	29.2 (SW463) –353.7 (SW396)	2.4 (SW431) –197.3 (SW470)
	Neutral to slightly alkaline	*Hypoxic to excellent aerobic conditions*	*Freshwater*	*Freshwater*	*Moderately reducing conditions*
E2	6.35 (SW390) – 8.43 (SW397)	1.29 (SW470) – 10.05 (SW393)	29 (SW398) – 797 (SW396)	19.0 (SW398) – 518.1 (SW396)	-264.9 (SW470) – 127.5 (SW462)
	Neutral to slightly alkaline	*Hypoxic to excellent aerobic conditions*	*Freshwater*	*Freshwater*	*Anaerobic to moderately reducing conditions*
E3	6.01 (SW462) – 8.14 (SW396)	3.20 (SW403) – 16.60 (SW398)	37 (SW416) – 536 (SW401)	24.1 (SW416) –348.4 (SW401)	-59.6 (SW401) –192.1 (SW400)
	Slightly acidic to slightly alkaline	*Poor to excellent aerobic conditions*	*Freshwater*	*Freshwater*	*Anaerobic to moderately reducing conditions*
E4	6.05 (SW424) – 8.11 (SW390)	2.51 (SW401) – 11.85 (SW393)	39 (SW398) – 1,523 (SW462)	25.2 (SW398) – 990.0 (SW462)	28.6 (SW416) – 167.6 (SW393)
	Slightly acidic to slightly alkaline	*Poor to excellent aerobic conditions*	*Freshwater*	*Freshwater*	*Moderately reducing conditions*
E5	6.37 (SW463) – 8.17 (SW398)	1.89 (SW427) – 8.95 (SW405)	29 (SW424) – 682 (SW412)	18.6 (SW424) – 443.3 (SW412)	-60.5 (SW430) – 180.3 (SW393)
	Neutral to slightly alkaline	*Poor to excellent aerobic conditions*	*Freshwater*	*Freshwater*	*Anaerobic to moderately reducing conditions*

Notes:

1. EC in µS/cm converted to TDS in mg/L by multiplying by 0.65.
2. The pH reading for SW336 (pH 3.52) during E2 was identified to be particularly low and is not consistent with historical ranges, while other parameters were comparable to the other four events. Based on this, it is considered an anomaly and has been excluded from the table.

©JBS&G Australia Pty Ltd

The following table can be used as a guide for the water quality parameters descriptions provided in **Table I.1** through **Table I.3** above.

Table I.4: Water Quality Parameter Descriptions

Parameter	Description	Reference or Comment
EC	Freshwater: 0–2,500 µS/cm Brackish Water: 2,500–5,000 µS/cm Saline Water: 5,000–50,000 µS/cm Seawater: 50,000 µS/cm	Based on general guidance discussed in Australian and New Zealand Environment and Conservation Council (ANZECC) and Agriculture and Resource Management Council of Australia and New Zealand (ARMCANZ) Water Quality Guidelines (ANZECC and ARMCANZ 2000).
pH	Acidic: <6.5 Neutral: 6.5–8.5 Alkaline: >8.5	No single national standard, but commonly used ranges from groundwater and wastewater treatment sources.
DO	Hypoxic: <2 mg/L Poor aerobic: 2–5 mg/L Good aerobic: 5–8 mg/L Excellent aerobic: >8 mg/L	Based on Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG 2018) and World Health Organisation Guidelines for Drinking-Water Quality (WHO 2022) water quality standards.
ORP	Anaerobic: <0 mV Moderately Reducing: 0–200 mV Oxidising: 200–400 mV Highly Oxidising: >400 mV	No single national standard, but commonly used ranges from groundwater and wastewater treatment sources.
