Executive Summary

General

JBS&G Australia Pty Ltd (JBS&G) has been engaged by the Department of Defence (Defence) to complete an Ongoing Monitoring Report (OMR) for the Bandiana Military Area (BMA or the base) and surrounding Management Area. The OMR includes the results of five Per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) sampling events that occurred during the period 2021 to 2023.

PFAS are a group of synthetic (i.e. 'man-made') compounds widely used around the world since the 1950s to make products that resist heat, stains, grease and water. Defence have historically stored and used PFAS containing aqueous film forming foam (AFFF) products on-base for firefighting purposes, which has resulted in PFAS contamination on and in the vicinity of the Defence estate.

The Management Area comprises both on-base and off-base areas. The on-base area comprises three separate portions of the base known as North Bandiana (Gaza Ridge Barracks), South Bandiana (Gaza Ridge Barracks) and East Bandiana (Wadsworth Barracks). PFAS has historically left the base into the off-base areas primarily by surface water runoff in North and South Bandiana and by groundwater flow in East Bandiana.

Objective

The objective of this OMR is to review data and determine if a) there are any significant changes in PFAS concentrations or areas affected by PFAS and b) if there are any risks to the community that require further management.

Monitoring Scope

The scope of the monitoring consisted of sampling of 46 groundwater wells, 54 surface water locations and 12 sediment locations across the base and surrounding area. While sampling occurs twice yearly, some locations are only sampled once a year (season dependent). The sampling events in this report occurred in November 2021, May 2022, October 2022, May 2023 and October 2023.

Groundwater

Groundwater levels (or depths) were higher during this period owing to above average rainfall. The area experienced 1,140 mm during 2022 compared to the annual average of 710 mm. This water level change may have contributed to some minor increasing PFAS concentration trends, particularly on-base where PFAS can reside in soil.

Groundwater flow directions across the BMA are consistent with the conceptual understanding of groundwater movement and generally follow the topography. The Shepparton Colluvium shallow aquifer (South Bandiana and North Bandiana) flows in a west and north westerly direction towards Jack in the Box Creek, while the Shepparton and Coonambidgal Fluvium aquifer at East Bandiana flows in a north easterly direction towards the Kiewa River.

The groundwater PFAS concentrations in off-base areas from the five OMP sampling rounds are relatively stable and consistent with the outcomes of historical and more recent investigations.

On-base, monitoring identified elevated PFAS concentration ins Source Area 1, the Petroleum Platoon – Former Fire Training Ground on South Bandiana, and Source Area 7, the Old Fire Station, Building 421 on South Bandiana. This data triggered Defence to request JBS&G to conduct further investigations to determine if remediation or further management actions are required.

Surface Water

The surface water results obtained from the five OMP sampling rounds were consistent with previous data.

Elevated PFAS concentrations were identified within several specific portions of South and North Bandiana (i.e. surrounding Source Areas) which is consistent with the conceptual understanding of these areas and consistent with existing investigation work. The surface water concentrations within East Bandiana were much lower by comparison and were also consistent with existing investigation work from this area.

Sediment

PFAS concentrations in sediment within surface water drainage pathways are representative of their location relative to Source Areas, with higher concentrations identified in areas immediately adjacent Source Area/in areas where elevated surface water concentrations are present. Sediment PFAS concentrations tend to decrease with distance from a Source Area.

Sediment concentrations from the OMP were compared to the historic results from 2017 and 2019, and were generally equal to, or less than the previous results.

Risk Summary

The OMP results did not identify any additional Source Areas which had not been previously assessed and no additional transport/exposure pathways or changes to existing pathways have been identified.

The OMP analytical results discussed as part of this OMR were generally within ranges identified and considered in previous investigation reports. Where PFAS increases have been identified during an OMP event, a review has been completed of the source-receptor pathway to identify if there has been a material change in risk to on and off-base receptors. No material changes have been identified.

Based on the review completed during this monitoring period, the risk assessment remains current and no further precautionary advice is warranted. It is noted that the Environment Protection Authority Victoria (EPA) has advised against consumption of Carp caught in the Kiewa River between Bakers Land and the Cudgewa-Wodonga Rail Trail, inclusive of the flood plain area bound by Bakers Lane and the Murray Valley Highway. A review of risk will be completed in future OMRs to reflect the results of a Water Use Survey program that Defence are undertaking in targeted areas of the Management Area.

Conclusions

Based on the assessment completed as part of this OMR, it was concluded that the objectives of the OMP have been achieved by the program. The assessment has identified that PFAS concentrations during the 2021 to 2023 period were generally consistent with previous investigation and historic data and as a result there has been no material change in risk to on and off-base receptors.

While the existing monitoring network is sufficient to continue monitoring of PFAS identified within Source Areas and migration pathways, there are several recommended alterations to the OMP monitoring program, including the following:

- Further monitoring of groundwater immediately off-base to the north of East Bandiana to delineate the known East Bandiana PFAS plume to the oxbow lake closest to the base boundary;
- Owing to the proximity of Source Area 1 to the base boundary and increases in MW307, collection of additional samples to ensure the monitoring of the potential migration of the PFAS plume;
- The addition of wells in North Bandiana to the program to ensure adequate data is available to calculate groundwater flow contours in this portion of the base, and to delineate elevated groundwater PFAS concentrations recently detected;
- Off-base monitoring through the provision of a new well (MW447) to the east of North Bandiana to characterise the PFAS plume prior to potentially entering the Killara residential development; and
- Discontinuation of sediment sampling as part of the OMP as there are no obvious trends in the data and they do not present a risk to people off-base.

©JBS&G Australia Pty Ltd

Defence has planned remedial works commencing in 2025 that will consist of remediation of Source Areas across South and East Bandiana as well as groundwater remedial works, also in East Bandiana. These works will in time contribute to reductions of PFAS concentrations in the Management Area however given the size of the area impacted, this will be a slow process. In the meantime, monitoring will continue, and advice will be provided to the community to ensure risks presented by PFAS are managed.

1. Introduction

JBS&G Australia Pty Ltd (JBS&G) has been engaged by the Department of Defence (Defence) to complete an Ongoing Monitoring Report (OMR) for the Bandiana Military Area (BMA or the base) and surrounding Management Area. The OMR includes the results of five Per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) sampling events that occurred during the period 2021 to 2023.

PFAS are a group of synthetic (i.e. 'man-made') compounds widely used around the world since the 1950s to make products that resist heat, stains, grease and water. Defence have historically stored and used PFAS containing aqueous film forming foam (AFFF) products on-base for firefighting purposes, which has resulted in PFAS contamination on and in the vicinity of the Defence estate.

BMA is located adjacent to the New South Wales (NSW) – Victorian State border southeast of Wodonga, Victoria. BMA itself comprises three areas, the boundaries of which have been provided in **Figure 1**:

- Gaza Ridge Barracks (North Bandiana);
- Gaza Ridge Barracks (South Bandiana); and
- Wadsworth Barracks (East Bandiana).

The Management Area has also been shown in **Figure 1** and comprises BMA along with off-base areas including Jack in the Box Creek, Kiewa River and their associated floodplains. The Management Area was derived based on the results of the Detailed Site Investigation (DSI) (Golder 2018)[1] and related to pathways in surface water and groundwater for potential PFAS contamination derived from BMA. These pathways were further refined as part of the Detailed Site Investigation Addendum (DSI Addendum) (JBS&G 2024a)[2] and the Mass Flux Study (JBS&G 2024b)[3].

This report presents the findings of five sampling events from the OMP conducted across both the BMA and the surrounding Management Area.

1.1 Background

BMA has been subject to previous investigations that have identified contamination as a result of the historical use of AFFF that contained a number of PFAS that are known to be persistent in the environment and in humans. The PFAS compounds of primary interest include perfluorooctane sulfonate (PFOS), perflourooctanoic acid (PFOA) and perfluorohexane sulfonate (PFHxS). Based on the results of previous investigations, there is strong evidence demonstrating that base-derived PFAS contamination has migrated off-base and will continue to migrate away from Source Areas located on-base without implementing management controls. Although, a Human Health and Ecological Risk Assessment (HHERA) (Golder 2020)[4] has been completed and shows that risk for scenarios currently being realised both on- and off-base are low and

[3] *PFAS Mass Flux Study – PFAS Management Area Plan (PMAP) Delivery at Bandiana Military Area*. Document Number 61395/ 153,765 – Draft Rev B. JBS&G Australia Pty Ltd. 6 September 2024. (JBS&G 2024b).

[4] *Human Health and Ecological Risk Assessment, Bandiana Military Area*. Document Number 1777738-150-R-RevB. Golder Associates Pty Ltd. November 2020. (Golder 2020).

acceptable, with risks which are potentially unacceptable relating to scenarios which are not currently occurring (see **Section 3.3** for further details).

The PMAP (Defence 2020)[5] was created to provide a roadmap to detail the management measures for the response management by Defence of potential risks arising from PFAS contamination associated with BMA and surrounding areas. As part of the PMAP, management actions were implemented to achieve this objective, one of which was the completion of the OMP, which sets out a program of monitoring twice yearly across BMA and the Management Area.

The purpose of the OMP, as defined in the PMAP (Defence 2020), is to set out the requirements for collection of adequate data to identify and evaluate:

- Spatial and temporal (including seasonal) variability of PFAS in the environment;
- Changes to PFAS sources, transport pathways and/or receptors for the BMA and wider Management Area;
- Whether risks to human and ecological receptors require review; and
- Whether the identified changes in PFAS concentrations during the OMP trigger an action and/or review.

The OMP, in accordance with the scope provided in the PMAP (Defence 2020) commenced at BMA in November 2021, with the works being completed by Cardno Victoria Pty Ltd (now Stantec). From this date, the OMP has been completed twice yearly. This OMR summarises sampling events completed by Stantec during November 2021, May 2022, October 2022, May 2023 and October 2023.

1.2 Objectives

The objective of this OMR is to review data and determine if a) there are any significant changes in PFAS concentrations or areas affected by PFAS and b) if there are any risks to the community that require further management.

1.3 Scope of Work

JBS&G completed the following scope of work as part of this OMR:

- Review of base and environmental settings to provide context to OMP data;
- Review monitoring data from Stantec's OMP monitoring events from November 2021, May 2022, October 2022, May 2023 and October 2023;
- Analysis of the PFAS concentration trends across the monitoring period; and
- Completion of this OMR detailing findings to the relevant objectives of the report.

[5] *Bandiana Military Area, PFAS Management Area Plan*. Document Number 1777738-153-R-RevA. Department of Defence. November 2020. (Defence 2020).

2. Base and Environmental Setting

The following base and environmental setting information has been summarised from previous investigations across the base.

2.1 Base Identification Details

The base is located approximately 255 kilometres (km) northeast of Melbourne and is adjacent to the New South Wales – Victorian State border. It is located on the eastern fringe of the large town of Wodonga. The site details have been summarised in **Table 2.1** below. The site boundary has been provided in **Figure 1**.

Table 2.1: Site Identification Details

Item	Details
Site Address	Murray Valley Highway, Bandiana
Site Area	650 hectares
Site Owner and Occupier	Department of Defence
Municipality	Wodonga City Council
Legal Description	North Bandiana – 2 PS437772, 1 and 2 TP849697 South Bandiana – 1, 2 and 3 TP849698, 3 PS420756 and 2 PS420756 East Bandiana – 1 TP849660, 1 TP139782 and 1 TP81825
Zoning	Commonwealth Land under the Wodonga Planning Scheme Amendment C120

2.2 Base Use and Features

The base is primarily used for administration, accommodation, training, equipment maintenance and storage and warehousing/logistics associated with Defence activities. The general land uses and features present across each area of the site has been provided in **Table 2.2**.

Table 2.2: Site Use and Features

Item	Details
South Bandiana (Gaza Ridge Barracks)	• Built infrastructure such as workshops, warehouses, office buildings, gymnasium, hardstand areas including roads and vehicle access and training areas; • On-base personnel accommodation areas; • Bandiana Primary School; • Golf course; • The Bandiana Army Museum; • Former and current fire training areas; • Grassed and vegetated areas which are generally undeveloped and contain little to no infrastructure; and • Sheep grazing is permitted in the southwestern portion of BMA along the base of Bears Hill.
North Bandiana (Gaza Ridge Barracks)	• Built infrastructure such as workshops, warehouses, office buildings, gymnasium, hardstand areas including roads and vehicle access and training areas; • On-base personnel accommodation areas; • Bandiana Neighbourhood House (child care centre); and • Grassed and vegetated areas which are generally undeveloped and contain little to no infrastructure.
East Bandiana (Wadsworth Barracks)	• Built infrastructure such as workshops, warehouses, office buildings, gymnasium, hardstand areas including roads and vehicle access and training areas;

	• Test track; and • Current fire station.

2.3 Surrounding Land Uses

The land uses surrounding the BMA has been summarised in **Table 2.3**.

Table 2.3: Surrounding Land Uses

Item	Details
North	Huon Hill Parklands is located directly north of North Bandiana, while residential developments are located directly north of East and South Bandiana. Commercial properties are also present along Anzac Parade located to the north of South Bandiana. Beyond the parklands is the Murray River and associated floodplain.
East	Residential developments are present east of both East and North Bandiana, while commercial properties and open farmland is east of South Bandiana. Beyond this is the Kiewa River and associated floodplain.
South	Bears Hill is used primarily for grazing and is located directly south of South Bandiana. Commercial properties, open farmland and minor rural residential development is present south of North and East Bandiana.
West	Wodonga townships is located directly west of the base and consists primarily of residential properties, with areas of commercial and/or industrial development.

2.4 General Site History

The full site history of the BMA has been detailed in the DSI (Golder 2018). The following site history summary was provided in the DSI:

North, South and East Bandiana were acquired in 1942 as part of the war efforts during World War II, with an estimated 4,000 troops stationed there to operate the facility. At this time, the facility served as a tank armoured vehicle and equipment workshop as well as containing administration and warehouse facilities. Vehicle handling included receiving vehicles direct from manufacturers and holding them before issue within Australia or overseas (which continues today). Construction of storage depots and workshops commenced in 1942, with railway tracks from NSW and Victoria also established around this time. The BMA has remained in use as a storage and vehicle processing facility with the addition of Army logistics training.

The North Bandiana Historic Warehouse Precinct, developed during World War II between 1942 and 1945, is recognised as one of Australia's largest facilities for the storage and processing of technical and motor transport stores. Since the early 1960s many of the World War II buildings at the three facilities have been demolished to make way for new constructions such as training, administration and accommodation facilities. Furthermore, from approximately the mid-1990s, portions of the property have been progressively divested. These have included the portions of the land now occupied by the adjacent residential estates.

2.5 Topography

The base is part of a relatively low-lying river and creek floodplain located between two topographically significant features (Huon Hill to the north and Bears Hill to the south, as shown on **Figure 1**). There is a topographic divide that runs across BMA in a general north-south alignment. To the west of the divide, the area generally slopes to the northwest towards Jack in the Box Creek, while to the east of the divide, the area generally slopes to the east or northeast towards the Kiewa River. Elevation of the respective areas of the base are as follows:

- **South Bandiana**: this portion of the base generally slopes gently from the southern boundary, 240 m above sea level at its highest point, to the northern boundary, 175 m above sea level at its lowest

point. South Bandiana is divided into two separate watersheds which slope to the northwest and northeast respectively;

- **North Bandiana:** this portion of the base generally slopes gently from northwest, approximately 203 m above sea level at its highest point, to the eastern boundary of the site, approximately 165 m; and
- **East Bandiana**: this portion of the base generally slopes gently from the western boundary, approximately 167 m above sea level at its highest point, to the eastern boundary of the base, approximately 157 m above sea level. The eastern portion of East Bandiana (to the east of the test track) falls off into the Kiewa River floodplain.

2.6 Climate

Long-term climatic data collected from the closest Bureau of Meteorology (BoM) station located at Wodonga (2.7 km west of base), indicated the following between 1898 and 2018:

- Annual rainfall is approximately 710 mm;
- Highest average monthly rainfall is approximately 81.2 mm, which occurs in July;
- Lowest average monthly rainfall is approximately 38.3 mm, which occurs in February;
- The highest average temperature is 31.8 °C, which occurs in January; and
- The lowest average temperature is 12.6 °C, which occurs in July.

It should be noted that rainfall data from the sampling events and from the sampling period (i.e. 2021 through 2023) has been discussed in **Section 7.1**.

2.7 Hydrology

As indicated previously, the base is divided into two catchments. West of the topographic divide flows to the northwest towards Jack in the Box Creek, while east of the divide flows into Middle Creek and an unnamed creek, both of which flow into the Kiewa River. Both the Jack in the Box Creek and Kiewa River catchments drain north into the Murray River catchment.

West of the divide comprises the western portion of South Bandiana, with the divide occurring approximately along Russell Road (internal road). Surface water is drained by a series of below ground stormwater infrastructure and above ground natural and man-made channels. Surface water flows in a north to northwest direction and exits the base via a surface channel which flows directly into Jack in the Box Creek. The on-base surface water channels are primarily ephemeral and only have flow during or immediately following rainfall. Jack in the Box Creek flows into Wodonga Creek, located approximately 3.5 km north of the base.

East of the divide comprises the balance of the base. The eastern most portion of South Bandiana drains eastward overland into Middle Creek which flows approximately 2.8 km east into Kiewa River. The balance of South Bandiana drains north into North Bandiana, with accumulated surface water flowing northeast across this portion of the base before exiting the eastern boundary adjacent Whytes Road and flowing down an unnamed creek before discharging into the Kiewa River approximately 1.4 km northeast of the base. East Bandiana stormwater flows to the northeast and is discharged into off-base oxbow lakes on the Kiewa River floodplain immediately east of the base. Surface water infrastructure on the balance of the base also comprises of a series of below ground stormwater infrastructure and surface drainage channels. The Kiewa River is a meandering watercourse and discharges into the Murray River approximately 3.0 km north of the base.

The stormwater divide and general surface water flow directions have been provided in **Figure 3**.

2.8 Geology and Hydrogeology

Details of the regional and local geological/hydrogeological setting are provided in previous investigation reports such as the DSI (Golder 2018) and DSI Addendum (JBS&G 2024a). There are three main geological units which are present at the base. From deepest to shallowest these are as follows:

- **Omeo-Metamorphic Complex**: Ordovician aged schist with intrusions of granite and gneiss. This material forms the bedrock of the area, with both Bears Hill and Huon Hill consisting of this unit;
- **Shepparton Formation:** Tertiary aged deposits of sand, silt and clay. Erosion and accumulation of sediments from the local hill are defined as the Shepparton Colluvium and can be found through the centre of the base. Deposition of alluvial sediments also occurred during this period and are termed the Shepparton Fluvium and are primarily found in the northwest and southwest of the site; and
- **Coonambidgal Formation:** Quaternary aged deposits of sand, silt and clay. More recent hill erosion is defined as the Coonambidgal Colluvium and can be found around the foot of Bears Hill and Huon Hill. Deposition around current waterways, including the Murray River, Kiewa River, Wodonga Creek and Middle Creek, is the Coonambidgal Fluvium.

While groundwater is present within the bedrock, the primary aquifers of concern with respect to PFAS are those present in the unconsolidated Shepparton and Coonambidgal Formations and in particular the colluvium at North and South Bandiana and fluvium at East Bandiana. These are discussed below for each portion of the base:

- **South Bandiana:** the sub surface at South Bandiana generally consists of unconsolidated hill-wash deposits (colluvium) (sands, silts, clays and gravels) from the Quaternary (Coonambidgal) and Tertiary (Shepparton) period. Based on site observations, the material consists primarily of fine-grained sediments (clays and silts) with some interbedded sands and gravels. These unconsolidated formations have been encountered to depths of approximately 32 to 36 metres below ground level (mbgl) depending on position on-base. Across the flatter northern portion of South Bandiana, the depth to groundwater in ranges between 10 to 15 mbgl, although this increases up to approximately 40 mbgl in the sloped southern portion (depending on seasonality and weather conditions);
- **North Bandiana:** observations from the northern and western portions of North Bandiana are considered representative of the Shepparton Colluvium, while the south portion is more consistent with the Shepparton Fluvium (alluvial sediments). In the north and west of North Bandiana, groundwater depth is up to 14.7 mbgl, while to the south east it is between 1.8 to 3.8 mbgl; and
- **East Bandiana**: observations from East Bandiana identified various layers of clays, silt and sand across the base consistent with a depositional environment (Shepparton/Coonambidgal Fluvium). Due to the presence of PFAS at the base boundary this area has been subject to significant investigation works. The depositional processes that occurred in this area of the base have resulted in a distribution of permeable sediments that is highly variable. The shallow portion (<10 mbgl) of the aquifer includes variably distributed (and generally discontinuous) sands and clays and has standing water levels ranging between approximately 6.6 and 8.2 m below top of case (mBTOC). A more continuous sandy layer is present between 10.0 and 15.0 mbgl and has a standing water level range between approximately 6.6 and 8.1 mBTOC. The sandy layer has an estimated hydraulic conductivity of approximately 10-20 m/day. Beneath the sandy layer, clay is present to the depth of completed investigations.

Groundwater flow directions are consistent with topography and surface water drainage. In South Bandiana, groundwater flow is primarily to the northwest towards Jack in the Box Creek, while in North and East Bandiana it is primarily to the east towards Kiewa River.

The Kiewa River, associated oxbows, Wodonga Creek and possibly the northern portion of Jack in the Box Creek are likely gaining streams (i.e. surface water bodies which receive groundwater discharge). Middle Creek and the unnamed creek are considered losing streams (surface water discharges into groundwater).

In addition to the above, it has been identified that a deeper sandy portion of the aquifer (i.e. between 10.0-15.0 mbgl) on East Bandiana intercepts one or more off-base oxbow lakes in the Kiewa River Floodplain to the northeast of the base.

©JBS&G Australia Pty Ltd

3. Conceptual Site Model Summary

A summary of the current Conceptual Site Model (CSM) for the BMA and Management Area has been summarised in the sections below.

3.1 Sources

Investigations completed to date have identified that there are various sources of PFAS across the base which relate to use or storage of AFFF products. Source Areas 1 through 15 (see **Figure 2** for locations) are considered the primary sources of PFAS, although varying concentrations of PFAS have been reported for affected media. The Source Areas also relate to different surface water catchments, flowing into Jack in the Box Creek or Kiewa River – further discussed in **Section 3.2** below. Current investigation results divide the identified PFAS Source Areas into the following categories:

- PFAS concentrations above relevant health-based criteria (refer **Section 6** for further details on criteria): Source Areas 1, 2, 5, 6, 7, 9, 11, 12, 13, 14 and 15;
- PFAS concentrations above laboratory standard limits of reporting, but below health-based criteria: Source Area 10; and
- Not considered a source: Source Areas 3, 4 and 8.

Description of the Source Areas as identified by the DSI (Golder 2018), and their respective Contaminated Site Record (CSR) ID, with PFAS concentrations above laboratory standard limits of reporting are as follows:

- Source Area 1 (CSR_VIC_000353) – Petroleum Platoon – Former Fire Training Ground (South Bandiana);
- Source Area 2 (CSR_VIC_000478) – Base Fire Services (BFS) – Former Fire Training Ground (South Bandiana);
- Source Area 5 (CSR_VIC_000365) – Petroleum Platoon – Fuel Handling Facility (South Bandiana);
- Source Area 6 (CSR_VIC_000350) – Fire Training Area, Building 600 (South Bandiana)[6];
- Source Area 7 (CSR_VIC_000357) – Old Fire Station, Building 421 (South Bandiana);
- Source Area 9 (CSR_VIC_000374) – Petroleum, Oils and Lubricants (POL), Building 490 (South Bandiana);
- Source Area 10 (CSR_VIC_000479) – Former Unit Training Area, between Warehouse 1 and 2 (North Bandiana);
- Source Area 11 (CSR_VIC_000480) – Fire Extinguisher Disposal – Warehouse 13 (North Bandiana);
- Source Area 12 (CSR_VIC_000483) – Armoured Vehicle Maintenance Training, Building 100 (North Bandiana);
- Source Area 13 (CSR_VIC_000383) – Fire Station – Current (East Bandiana);
- Source Area 14 (CSR_VIC_000481) – Former Unit Training, Building 592 (East Bandiana); and
- Source Area 15 (CSR_VIC_000482) – Former Unit Training, Football Field (East Bandiana).

[6] Source Area 6 in previous documentation, including the PMAP (Defence 2020), has been identified as the Current Fire Training Area, Building 600. A new Fire Training Area however has since been constructed and commissioned and the facility located at Source Area 6 retired from active service. This Source Area will therefore just be referred to as the Fire Training Area, Building 600 for the balance of this document.

It should be noted that Defence have completed significant investigation work subsequent to the DSI (Golder 2018) which have provided further data on Source Areas and their contribution of PFAS mass to the migration pathways. This additional work has identified a PFAS plume in multiple aquifers originating from Source Area 13 that is migrating northeast across East Bandiana and migrating into off-base areas. Furthermore, several Source Areas, including Source Area 1, 6 and 7 on South Bandiana (further discussed in this report), identified concentrations of PFAS in soil which are considered to contribute to PFAS concentrations in surface water. Based on this, these four Source Areas and pathways are the primary focus of Defence and remediation work is planned to be carried out during 2025 to reduce PFAS migration levels. All other Source Areas across BMA continue to be monitored as part of the OMP program to ensure PFAS concentrations continue to present a low risk to on- and off-base users and the environment, however, are not to be considered for remediation at this stage.

3.2 Pathways

3.2.1 Surface Water

Surface water drains into and across BMA in a network of above ground drainage channels, swales and shallow below ground pipes. Surface water has been identified as a pathway for migration of PFAS from identified PFAS Source Areas on North, South and East Bandiana towards both Jack in the Box Creek and Kiewa River catchments. PFAS will continue to migrate through this pathway in the absence of management controls. Broadly the surface water catchment for the base runs north to south, with a divide through South Bandiana in the approximate location of Russell Road. Based on this, surface water drainage from the following Source Areas flow into each of the two respective catchments shown in **Figure 3**:

- Jack In the Box Creek (flow direction to the west/northwest) receives surface water from South Bandiana that includes Source Areas 1, 2, 5 (partial), 6 and 7;
- Kiewa River (flow direction to the east):
    - South Bandiana – Source Areas 5 (partial) and 9;
    - North Bandiana – Source Areas 10, 11 and 12; and
    - East Bandiana – Source Areas 13, 14 and 15.

Based on investigations completed to date, the primary PFAS transport pathway for both South and North Bandiana has been shown to be through surface water, primarily owing to PFAS leaching from soils and infrastructure in the key Source Areas identified above. Surface water is a secondary PFAS transport pathway for East Bandiana. Site history (Golder 2018) has shown that previous base re-development has either capped or removed a large portion of potentially PFAS affected soils within East Bandiana, removing this as a potential source for surface water.

3.2.2 Groundwater

In the Management Area, and particularly on the base itself, groundwater has been identified as a primary pathway for the migration of PFAS from Source Areas in East Bandiana and as a secondary pathway for those in South and North Bandiana. Groundwater is likely discharging to the lower portion of Jack in the Box Creek from a portion of South Bandiana and to the oxbows in the Kiewa River floodplain or the Kiewa River itself for the balance of the base.

Groundwater contours within the Management Area, consistently show that a groundwater divide is present through the centre of the Area – on-base through North Bandiana itself. Based on this, groundwater flow from the following Source Areas can be attributed to each of the two catchments:

- Jack in the Box Creek (flow direction to the west/northwest):
    - South Bandiana – Source Areas 1, 2, 5, 6, 7 and 9; and

- North Bandiana – Source Areas 10 (partial) and 12 (partial).

- Kiewa River (flow direction to the east):
  - North Bandiana – Source Areas 10 (partial), 11 and 12 (partial); and
  - East Bandiana – Source Areas 13, 14 and 15.

Due to a combination of the depth to groundwater, the clayey nature of the geology below the Jack in the Box Creek catchment portion of the base in North and South Bandiana and the distance to the discharge point, PFAS from Source Areas migrates slowly from soil into groundwater and there is limited lateral migration in groundwater. Therefore, groundwater is not considered a significant pathway for PFAS discharge off-base to this catchment, although significant (>100 ug/L of Sum PFAS) PFAS concentrations have been identified in several Source Areas within these portions of the base, including Source Area 1 and 7. In these instances, the concentrations of PFAS in groundwater are due to historic excavation/use of a fire training bund and installation of infrastructure, respectively. These areas will be the subject of remedial action.

In the eastern portion of the Management Area, the geology and hydrogeology differ to North and South Bandiana, with the Shepparton Fluvium on this part of the base and off-base to the east in the Kiewa River catchment comprising variable deposits of sands, clays and silts. Previous investigations have identified a relatively continuous sand layer, semi-confined and interconnected with shallower and deeper portions of the aquifer, below East Bandiana between a depth of approximately 10.0-15.0 mbgl. The depth of this layer correlates with the off-base springs, oxbow lakes and the Kiewa River situated beyond the northeastern boundary of the base. Groundwater flow in this layer is therefore considered a pathway for PFAS migration from East Bandiana.

3.2.3 Sewerage System

A sewerage network has been constructed below ground across North, South and East Bandiana and services the base buildings. The sewerage network runs within or adjacent to multiple Source Areas before discharging off-base to the North East Region Water municipal waste treatment facility. Previous investigation work included PFAS analysis from the sewer. It was identified that minor PFAS concentrations infiltrate into sewerage infrastructure during rain events from Source Areas, while PFAS is also likely present within the concrete infrastructure of the system itself, which diffuses back into sewage which flows occur. Overall, the sewerage network is considered a secondary pathway for PFAS migration for the BMA, compared to groundwater and surface water pathways.

3.3 Receptors and Receptor Linkages

There are a variety of on and off-base receptors who could potentially be affected by PFAS, which have been summarised in **Table 3.1**.

Table 3.1: Receptors and Associated Potential Receptor Linkages

Exposure Group	Potential Exposure Via
On-base residents	• Incidental ingestion of soil and/or water on the base and eating potentially impacted biota grown or caught on the base; • Inhalation of dust; or • Eating potentially affected biota grown within the catchment area, including home grown foods, such as fruit and vegetables and livestock.
On-base workers, army personnel and visitors who work or visit the base	• Incidental ingestion of soil and/or water on the base; or • Inhalation of dust.

Exposure Group	Potential Exposure Via
On-base terrestrial or aquatic ecosystems including flora and/or fauna	• Direct contact with and/or uptake of contaminants from soil, sediment or surface water; • Ingestion by fauna including eating affected biota (including incidental ingestion of soil/sediment adhering to plants/grass) and drinking impacted surface water; or • Ingestion by fauna of greater PFAS concentrations by higher trophic level predatory species due to the tendency for PFAS compounds to bioaccumulate and biomagnify within ecosystems.
Off-base sensitive receptors including people who either live, or attend schools or childcare facilities within the portions of the Jack in the Box Creek or Kiewa River catchments downstream of the base	• Drinking potentially affected water; • Incidental ingestion of potentially affected soil, sediment, surface water or groundwater; • Inhalation of potentially affected dust; or • Eating potentially affected biota grown, caught or reared within the catchment area, including home grown or agriculturally produce.
Recreational users including people using public open recreational spaces within the portions of the Jack in the Box Creek or Kiewa River catchments downstream of the base	• Incidental ingestion of potentially affected soil, sediment, surface water or groundwater; • Inhalation of potentially affected dust; or • Eating potentially affected biota caught within the catchment area, including recreationally caught fish and yabbies.
Commercial/industrial workers including general commercial/industrial workers, sewage treatment plant workers and maintenance/trench workers operating within the portion of the Jack in the Box Creek or Kiewa River catchments downstream of the base	• Incidental ingestion of potentially affected soil, sediment, surface water, sewage or groundwater; or • Inhalation of potentially affected dust.
Off-base terrestrial or aquatic ecosystems including flora and/or fauna	• Incidental ingestion of potentially affected soil, sediment, surface water or groundwater; or • Inhalation of potentially affected dust.
Off-base terrestrial or aquatic ecosystems including flora and/or fauna	• Direct contact with and/or uptake of contaminants from soil, sediment or surface water; • Ingestion including eating impacted biota (including incidental ingestion of soil/sediment adhering to plants/grass) and drinking affected surface water; or • Ingestion of greater PFAS concentrations by higher trophic level predatory species due to the tendency for PFAS compounds to bioaccumulate and biomagnify within ecosystems.

3.4 Exposure and Risk

The work undertaken to inform the DSI (Golder 2018), HHERA (Golder 2020) and DSI Addendum (JBS&G 2024a) has confirmed that for each of the key exposure scenarios identified as currently being realised, the potential exposure to PFAS was assessed to present a low and acceptable risk to human health. These realised exposure scenarios, which related to both on-base and off-base areas, are as follows:

- Home consumption of sheep (meat) raised on-base;

- Extraction of water from Wodonga Creek by North East Water for the municipal town supply;
- Home consumption of cattle (meat and offal) raised within the northern pastoral areas (i.e. area to the east of the Killara residential development);
- Residents who consume home grown produce (vegetables) and poultry eggs watered with groundwater extracted from adjacent to the northern section of East Bandiana;
- Recreational users (e.g. swimming, boating) within the Wodonga Creek, Kiewa River and unnamed creek waterways;
- Consumption of Murray Cod recreationally caught from the Kiewa River;
- Consumption of crustaceans recreationally caught from Jack in the Box Creek and unnamed creek; and
- Use of groundwater drinking water (one property).

The only potentially unacceptable human health risks were associated with unrealised scenarios which were assessed to inform stakeholders of potential future risks. There were eight risks identified in total which have been summarised in the following points:

- Use of groundwater as drinking water or stock watering;
- Home consumption of cattle (meat and offal) raised within the southern pastoral area;
- Consumption of recreationally caught carp from the main Kiewa River channel, oxbow lakes of the Kiewa River floodplain and Unnamed Creek;
- Consumption of recreationally caught fin fish and yabbies from oxbow lakes in the floodplain of the Kiewa River, adjacent to East Bandiana;
- Consumption of eggs from home raised poultry watered with extracted groundwater – boundary of East Bandiana and Jack in the Box Creek catchment;
- Consumption of home grown produce (vegetables and eggs) irrigated with extracted surface water – floodplain of the Kiewa River adjacent to East Bandiana and Jack in the Box Creek;
- Consumption of home grown produce (vegetables) irrigated with extracted groundwater – floodplain of the Kiewa River adjacent to the southern portion of East Bandiana; and
- Incidental ingestion of surface water during recreational activities – floodplain of the Kiewa River adjacent to East Bandiana.

With PFAS concentrations in groundwater and surface water identified as part of the recent JBS&G investigation (i.e. DSI Addendum and Mass Flux Study) being similar to those previously taken into consideration in the HHERA (Golder 2020), there is considered to be no change to the status of the above identified unrealised exposure pathways. Furthermore, Defence has planned remedial works commencing in 2025 that will consist of remediation of Source Areas across South and East Bandiana as well as groundwater remedial works, also in East Bandiana. These works will in time contribute to reductions of PFAS concentrations in the Management Area, which will further reduce the risks highlighted in the section above.

4. OMP Scope and Sampling

4.1 Overview

This OMR reviews the sampling completed by Stantec during five OMP sampling events, specifically November 2021, May 2022, October 2022, May 2023 and October 2023. All five events were completed as required in the PMAP (Defence 2020) and in accordance with the Sample Analysis Quality Plan (SAQP) (Stantec 2024b)[7], which is provided in **Appendix A**. Exceptions to this have been detailed in **Section 4.4**. Furthermore, Stantec indicate that the OMP work was undertaken in general accordance with the applicable industry standards for a site investigation, with these standards being as follows:

- Australian and New Zealand Guidelines (2018), Australian and New Zealand Guidelines for Fresh and Marine Water Quality;
- Australian Standard AS 4482 (2005) *Guide to the Investigation and Sampling of Sites with Potentially Contaminated Soils, Part 1 - Non-volatile and semi-volatile compounds* (noting that this standard has been withdrawn, however remains part of the state of knowledge);
- Department of Defence (2021), *Contamination Management Manual (DCMM)*, March 2018, amended June 2021;
- Department of Defence (2019), Pollution Prevention Management Manual – Annex 1L: Pollution Prevention Guideline - Routine Water Quality Monitoring;
- Department of Defence (2018), Quality System Manual Schedule B15 USEPA DQO Process;
- EPA Victoria (2022), Groundwater Sampling Guidelines, Publication 669.1, February 2022;
- EPA Victoria (2009), Sampling and Analysis of Waters, Wastewaters, Soils and Wastes, Publication IWRG701, June 2009;
- Heads of Environmental Protection Authority's Australia and New Zealand (HEPA) (2020), *PFAS National Environmental Management Plan (NEMP) Version 2.0*, January 2020;
- National Environment Protection Council (NEPC) (2013), National Environmental Protection (Assessment of Site Contamination) Measure (1999, as amended 2013) (ASC NEPM);
- National Health and Medical Research Council (NHMRC), (2019), Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water, August 2019;
- Standards Australia (1998), AS/NZ 5667:1998, Water quality – Sampling;
- U.S. Environmental Protection Agency (USEPA), (2006), Guidance for the Data Quality Objectives Process (EPA QA/G-4); and
- USEPA, (2002), Guidance on Environmental Data Verification and Data Validation (EPA QA/G-8).

4.2 OMP Sampling Requirements

4.2.1 OMP Sampling Locations

The OMP sampling requirements are detailed in the PMAP (Defence 2020). **Table 4.1** provides a list of groundwater, surface water and sediment sampling locations which are to be completed during each sampling event, along with the reasoning for the position of each sample location in the context of the overall program and the base. In total, 44 groundwater wells, 53 surface water locations and 12 sediment locations are sampled

[7] *PFAS OMP Sampling and Analysis Quality Plan (SAQP), Bandiana Military Area*. Stantec Pty Ltd. 28 March 2024. (Stantec 2024b).

as part of the OMP, although the number of locations sampled depends on season. Groundwater sample locations are provided in **Figure 4**, while surface water and sediment locations are provided in **Figure 5A** and **5B**.

Table 4.1: OMP Sampling Locations as per PMAP (Defence 2020)

Catchment	Surface Water (Bi-Annual)	Sediment (Annual)	Groundwater		Target Area	Justification
			Annual	Bi-annual		
On-base Locations						
Jack in the Box Creek	SW302, SW307, SW310		MW315, MW317 MW318		South Bandiana, on-base, Source Area 2	Locations targeting surface water and groundwater within and downgradient of the Source Area.
	SW311, SW313, SW316, SW321		MW304, MW307, MW311		South Bandiana, on-base, Source Area 1	Locations target surface water and groundwater within and downgradient of the Source Area. SW311 and MW304 is the point of discharge off-base into Jack in the Box Creek.
	SW322		MW312		South Bandiana, on-base	SW322 and MW312 is a point of discharge off-base into Jack in the Box Creek. The point is also at the confluence of surface water drainage from Source Areas 1, 2, 5, 6 and 7.
	SW323	SD323			South Bandiana, on-base	This point represents the confluence of drainage from Source Areas 5, 6 and 7 and depositional environment prior to discharging off-base.
	SW324, SW326, SW332, SW336		MW051[1], MW326/MW416[2], MW323		South Bandiana, on-base, Source Area 6	Locations target surface water and groundwater discharge from Source Area 6. SW336 is located within the Fire Training Area settling pond. SW324 and SW332 target two different flow paths from the Source Area.
	SW333, SW338		MW329		South Bandiana, on-base, Source Area 5	Locations target surface water and groundwater discharge from Source Area 5. SW333 targets discharge to Jack in the Box Creek. SW338 is the large pond within the Source Area. SW340 targets discharge to the Kiewa River.
Kiewa River	SW340					
Jack in the Box Creek	SW448		MW319, MW321		South Bandiana, on-base, Source Area 7	Locations target surface water and groundwater discharge from Source Area 7.
Kiewa River	SW346, SW349, SW355	SD346, SD355	MW056[3]		South Bandiana, on-base, Source Area 9 and Stormwater Ponds (wetlands)	MW056 targets perched groundwater identified within Source Area 9. Surface water locations are targeting discharge into, within and discharging from the South Bandiana Stormwater Ponds.
	SW370, SW374, SW375	SD375	MW342	MW345, MW346	North Bandiana, on-base, Source Areas 10, 11 and 12	SW370 is within the unnamed creek, targeting contributions from Source Areas 10, 11 and 12. MW342 targets Source Area 12. MW345 is within the shallow Fluvium where potential groundwater/surface water interactions may be occurring. SW375, SD375 and MW346 is the point of discharge off the Site.
	SW379, SW380			MW052[4], MW403[5], MW404[6], MW350_S, MW350_D, MW009, MW016, MW042, MW043, MW035, MW034, MW046[7], MW047[7], MW018, MW020, MW012, MW029, MW352, MW353, MW354	East Bandiana, on-base, Source Area 13, 14 and 15	Locations are targeting surface water discharge from Source Area 13. The groundwater locations are targeting the East Bandiana groundwater plume, which is emanating from Source Area 13 and discharges off-base across the eastern site boundary.
	SW382, SW387, SW388	SD382		MW351	East-Bandiana, on-base	Locations are targeting the points of discharge from East Bandiana into the Kiewa River and floodplain. MW351 targets the downgradient boundary adjacent to the residential properties.
Off-base Locations						
Jack in the Box Creek	SW424, SW463	SD424, SD463	MW313		Upper Jack in the Box Creek	Locations are targeting publicly accessible open space land use areas where yabby trapping occurs. MW313 targets the residential estate located beyond the South Bandiana boundary. Groundwater monitoring locations represent potential human health exposure, as it targets the residential estate located beyond the South Bandiana boundary where a number of groundwater bores with unknown use were identified in the DSI (Golder 2018).
	SW427			MW360	Lower Jack in the Box Creek	SW427 is located where the creek passes near sensitive land use areas (i.e. a child care centre) where sensitive receptors such as children could be exposed. MW360 is located within the Fluvium where elevated concentrations were identified and where potential groundwater/surface water interactions may be occurring.
	SW430			MW361		MW361 is located within the fluvium where elevated concentrations were reported. SW430 is in proximity to groundwater well (MW361) to allow assessment of groundwater/surface water interactions.

©JBS&G Australia Pty Ltd

Catchment	Surface Water (Bi-Annual)	Sediment (Annual)	Groundwater		Target Area	Justification
			Annual	Bi-annual		
	SW431					SW431 is located where flood diversion structures are located and if used may results in the release of water into Wodonga Creek upgradient of the North East Water abstraction point.
	SW432					SW432 is located downgradient of several off-base sources identified within the DSI (Golder 2018).
	SW434				Jack in the Box and Wodonga Creek confluence	SW434 is located at the confluence of Jack in the Box Creek and Wodonga Creek and represents the downgradient point of monitoring within the Management Area within the Jack in the Box Creek catchment.
Kiewa River	SW409				Unnamed creek	SW409 is located where the unnamed creek passes near sensitive land use areas (i.e. Henrika Kuljurgies Reserve and surrounding Killara residential properties) where sensitive receptors such as residents may be present.
	SW403, SW405, SW412, SW462	SD412		MW357	Unnamed creek and Kiewa River oxbows	Locations SW403 and SW405 are oxbow lakes within the Central Pastoral area and SW412 and SW462 are where the unnamed creek passes through the Northern and Central Pastoral Areas. The HHERA (Golder 2020) identified potential unacceptable human health risks associated with the consumption of carp from within the unnamed creek. SW462 and MW357 are at the point where the unnamed creek discharges into the Kiewa River. SD412 is a depositional environment within the unnamed creek on the Kiewa River floodplain.
	SW395, SW396, SW397, SW400, SW401, SW470, SW471, SW487	SD395, SD396, SD397, SD400		OTH019	Kiewa River oxbows	Locations are oxbow lakes located on the Kiewa River floodplain within the Southern Pastoral Area. Groundwater location OTH019 represents point of potential human health exposure where bore water is used for irrigation of home grown produce and drinking water for chickens. SW487 is targeting seepage water, where groundwater seeps were identified at the Kiewa River floodplain during the HHERA (Golder 2020). MW356 targets the assessment of groundwater/surface water interactions at the Kiewa River.
	SW390				Kiewa River – main channel	SW390 is the Kiewa River background location and represents conditions upstream of the Baranduda Water Treatment Plant (WTP) and Middle Creek.
	SW393				Middle Creek	SW393 is located within Middle Creek and represents potential contributions from the Middle Creek catchment. The HHERA (Golder 2020) identified potential unacceptable human health risks associated with the consumption of carp from within the Middle Creek.
	SW398, SW404			MW356	Kiewa River – main channel	Locations are within the Kiewa River main channel and represents conditions downgradient of the on-base discharges and where recreational activities commonly occur within the river. MW356 targets the assessment of groundwater/surface water interactions at the Kiewa River.
	SW416					SW416 is located within the main Kiewa River channel at the point of confluence with the unnamed creek where recreational activities commonly occur within the river and represents the downgradient point of monitoring within the Management Area and within the Kiewa River catchment.

Notes

1. Monitoring well MW051 was previous identified as MW04 within the PMAP (Defence 2020). MW051 is the current Defence labelling for this well and will be adopted for the purposes of this report.
2. In April 2023, MW326 was replaced by a new groundwater monitoring well MW416 in the same location
3. Monitoring well MW056 was previous identified as BH111 within the PMAP (Defence 2020). MW056 is the current Defence labelling for this well and will be adopted for the purposes of this report.
4. Monitoring well MW052 was previous identified as MW06-a within the PMAP (Defence 2020). MW052 is the current Defence labelling for this well and will be adopted for the purposes of this report.
5. Monitoring well MW403 was previous identified as BH1 within the PMAP (Defence 2020). MW403 is the current Defence labelling for this well and will be adopted for the purposes of this report.
6. Monitoring well MW404 was previous identified as BH2 within the PMAP (Defence 2020). MW404 is the current Defence labelling for this well and will be adopted for the purposes of this report.
7. Monitoring wells identified within the PMAP (Defence 2020) as MW046 and MW047, have been identified as MW046_I and MW046_D respectively during Stantec sampling events. MW046_I and MW046_D will be the sample locations adopted for the purposes of this report.
8. It should be noted that groundwater monitoring wells MW325 and MW328 within Source Area 6 on South Bandiana have been sampled during the October 2022 sampling event in lieu of MW326 which could not be sampled owing to a blockage.

©JBS&G Australia Pty Ltd

4.2.2 Groundwater Sample Locations

As detailed previously in **Section 4.2.1**, a total of 44 groundwater monitoring wells are sampled across the base and the Management Area as part of the OMP. As discussed in **Section 2**, multiple geological units are present across the base. In general groundwater wells within the Jack in the Box Creek catchment, on the western side of the base, are within the Shepparton Colluvium, while wells within the Kiewa River catchment, on the eastern side of the base, are within the Shepparton Fluvium and Coonambidgal Fluvium.

A review of the OMP groundwater wells has been completed, particularly in light of the further aquifer information obtained across East Bandiana as part of the DSI Addendum (JBS&G 2024a). A summary of the groundwater wells and their respective well screen and wells depths have been provided in **Appendix B**. Based on this information, the OMP wells have been divided into relevant aquifers/screened intervals, as summarised in **Table 4.2.**

It is noted that OTH019 is groundwater sampled from a private bore off-base. The well however is not directly accessed during OMP sampling events (rather a sample is collected from a tap, the water of which is extracted groundwater that is understood to be held in an above ground storage tank) and the construction details of the well are unknown. As such, this sample location has not been assigned an aquifer.

Table 4.2: OMP Sampled Wells vs. Aquifers

Geological Unit	Aquifer Interval	Aquifer Depth (mbgl)	OMP Wells
Shepparton Colluvium	Shallow 'S'	Variable, based on position on-base. Identified between approximately 5.0 and 42 mbgl	MW051, MW304, MW307, MW311, MW312, MW313, MW315, MW317, MW318, MW319, MW321, MW323, MW325, MW326, MW328, MW329, MW342, MW360, MW361, MW416
Shepparton Fluvium and Coonambidgal Fluvium	Shallow 'S'	5.0-10.0	MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW043, MW052, MW345, MW346, MW350_S, MW351, MW352, MW353, MW354, MW356, MW357, MW403, MW404
	Intermediate 'I'	10.0-15.0	MW009, MW042, MW046_I
	Deep 'D'	>15.0	MW046_D, MW350_D
Perched Water	-	Approximately 3.0	MW056

The geological units and the aquifer intervals are discussed throughout the balance of this report, with key outcomes such as results and groundwater flow contours discussed in the context of their respective aquifer.

4.3 Stantec Sampling Event Summary

As indicated throughout this document, this OMR summarises results from five OMP sampling events, which has been detailed in the following **Table 4.3**.

Table 4.3: OMP Sampling Event Summary

Sample Event	Sampling Period	Locations Sampled As Part of Event	Deviations from OMP SAQP[1]	Stantec Factual Report
E1	8 to 17 November and 22 December 2021	42 groundwater sample locations and 53 surface water sample locations.	Yes	Provided in **Appendix C**.
E2	2 to 9 May 2022	32 groundwater sample locations, 42 surface water sample locations and 12 sediment sample locations.	Yes	Provided in **Appendix D**.
E3	10 to 15 October and 10 November 2022	41 groundwater sample locations and 52 surface water sample locations.	Yes	Provided in **Appendix E**.
E4	1 to 6 May 2023	33 groundwater sample locations, 49 surface water sample locations and 12 sediment sample locations.	Yes	Provided in **Appendix F**.
E5	23 to 27 October and 27 to 28 November 2023	41 groundwater sample locations and 44 surface water sample locations	Yes	Provided in **Appendix G**.

Note:

1. Deviations from the OMP SAQP have been summarised and discussed in the section below.

4.4 Deviations from OMP SAQP

Deviations are not uncommon for reasons of weather conditions, access and safety concerns that inhibit the ability to collect some samples at particular locations. **Table 4.4** provides a summary of these concerns during the reporting period and a summary of the impact on the program. Full detail of deviations for each event, as detailed in the Stantec Factual Reports, has been provided in **Appendix H**.

Table 4.4: Deviations from OMP SAQP Summary

Sample Event	Number of Samples Not Collected	Number of Deviations	Summary of Deviations and Impact on Program
E1	Groundwater – 2 Surface water – 1	Groundwater – 7 Surface water – 1	Deviations relate to alternative sampling methods or locations not being sampled owing to a lack of water. The alternative sampling methods did not produce significantly different results compared to the existing data set. For locations that could not be sampled, results were available further downgradient or from previous sampling events.
E2	Groundwater – 0 Surface water – 10 Sediment – 0	Groundwater – 1 Surface water – 10 Sediment – 0	Deviations relate to an alternative sampling method for OTH019, surface water locations not being sampled owing to a lack of water, or the resampling of surface water locations during a second base visit post rain. The alternative sampling methods for OTH019 is considered appropriate as it is consistent across the OMP sampling events. For locations that could not be sampled, results were available further downgradient, from previous sampling events or sampled during the second base trip.
E3	Groundwater – 5 Surface water – 1	Groundwater – 8 Surface water – 3	Deviations relate to alternative sampling methods for OTH019, data loss, inaccessibility to sampling locations owing to flooding or locations not being sampled owing to a lack of water. The alternative sampling methods for OTH019 is considered appropriate as it is consistent across the OMP sampling events. Efforts were made to re-access and sample locations which were previously blocked by flooding. For the

Sample Event	Number of Samples Not Collected	Number of Deviations	Summary of Deviations and Impact on Program
			majority of locations that could not be sampled, results were available further downgradient, from previous sampling events or sampled during the second base trip.
E4	Groundwater – 0 Surface water – 4 Sediment – 0	Groundwater – 0 Surface water – 4 Sediment – 0	Deviations related to four surface water sample locations not being sampled owing to a lack of water. For these locations, results were available further downgradient or from previous sampling events.
E5	Groundwater – 4 Surface water – 9	Groundwater – 10 Surface water – 11	Deviations relate to resampling of locations owing to new exceedances or unexpected results, sampling of incorrect or non-OMP locations, or locations not being sampled owing to a lack of water. Resampling of new exceedances or unexpected results provided additional data to make an assessment on the validity of the data. For locations that could not be sampled, results were available further downgradient, from previous sampling events or sampled during the second base trip.

Overall, the deviations from the OMP SAQP (Stantec 2024b) are not considered material to the overall program. The data set generated as part of the OMP E1 through E5 has assisted in monitoring changes in PFAS concentrations at BMA and across the PFAS Management Area. Alongside other PFAS investigations completed at the base such as the DSI Addendum (JBS&G 2024a) and the Mass Flux Study (JBS&G 2024b), a comprehensive CSM has been developed which informs the implementation and revision of the PMAP (Defence 2020) risk management actions.

5. Quality Assurance and Quality Control

The Stantec SAQP (2024b) details Quality Assurance and Quality Control (QA/QC) procedures which were implemented across the five sampling rounds between 2021 and 2023 to ensure validation of precision and accuracy. JBS&G note that the program was planned, undertaken and reported based on the seven step Data Quality Objectives (DQO) process outlined in the ASC NEPM. This included data quality indicators and quality assurance and quality control processes that were applied to the conduct of field works undertaken to obtain relevant samples and the data returned from the analytical laboratories for the different media analysed.

An overall data quality review has been completed by Stantec for each sampling event and is detailed in the Factual Reports provided in **Appendix C** through **Appendix G**.

Based on the review completed, the analytical results are considered representative of the concentration of the parameters within the sample media. It is therefore considered that the QA procedures implemented were acceptable in minimising cross contamination during sampling and transportation to the analytical laboratory. Overall, the data collected during the five sampling events is deemed to be suitable for the purposes of the program.

6. Assessment Criteria

Under the Environment Protection Act 2017 (VIC) the Environment Reference Standard (ERS) has been made under Section 93 of the Act, which requires Environmental Values of groundwater to be protected, according to the natural salinity of the groundwater. The groundwater quality across the BMA is classified as Segment A1, A2 and B (according to analysis completed as part of the DSI (Golder 2018) and DSI Addendum (JBS&G 2024a)). Under the ERS, the base is also within the geographic region that falls within the Murray and Western Plains, Rivers and Streams Segment, as such, the applicable Environmental Values have been summarised in **Table 6.1**.

Table 6.1: Groundwater and Surface Water Environmental Values

Environmental Value	Groundwater	Surface Water	Notes
Water Dependent Ecosystems and Species	✓	✓	Slightly to moderately modified applies to surface water
Potable Water Supply (Desirable)	✓	✓	Identified as human consumption after appropriate treatment for surface water
Potable Mineral Water Supply	✓		
Agriculture and Irrigation (Irrigation)	✓	✓	
Agriculture and Irrigation (Stock Watering)	✓		
Human consumption of aquatic foods		✓	
Aquaculture		✓	
Industrial and Commercial	✓	✓	
Water-based Recreation (Primary Contact Recreation)	✓	✓	
Water-based Recreation (Secondary Contact)		✓	
Water-based Recreation (Aesthetic Enjoyment)		✓	
Traditional Owner Cultural Values	✓	✓	
Buildings and Structures	✓		
Geothermal Properties	✓		

An evaluation of groundwater and surface water Environmental Values is presented in **Table 6.2**, which summarises whether they are existing, likely or potential or unlikely for on- and off-base, in accordance with the work completed as part of the DSI (Golder 2018) and the HHERA (Golder 2020). Further details on the assessment of relevant Environmental Values (previously termed Beneficial Uses under the State Environmental Protection Policy (Waters)) can be found in these documents.

Table 6.2: Groundwater and Surface Water Environmental Values On- and Off-Base

Environmental Value	On-Base			Off-Base		
	Existing	Likely/ Potential	Unlikely	Existing	Likely/ Potential	Unlikely
Water Dependent Ecosystems and Species	✓			✓		
Potable Water Supply (Desirable);			✓		✓	
Potable Mineral Water Supply			✓			✓
Agriculture and Irrigation (Irrigation)			✓		✓	
Agriculture and Irrigation (Stock Watering)			✓	✓		
Industrial and Commercial			✓			✓

Environmental Value	On-Base			Off-Base		
	Existing	Likely/ Potential	Unlikely	Existing	Likely/ Potential	Unlikely
Human consumption of aquatic foods			✓	✓		
Aquaculture			✓			✓
Water-based Recreation (Primary Contact Recreation)			✓	✓		
Water-based Recreation (Secondary Contact)		✓		✓		
Water-based Recreation (Aesthetic Enjoyment)	✓			✓		
Traditional Owner Cultural Values	✓			✓		
Buildings and Structures	✓			✓		
Geothermal Properties			✓			✓

Based on the above, the Tier 1 screening criteria that has been adopted for the relevant Environmental Values has been provided in **Table 6.3**.

It should be noted that surface water interacts with groundwater throughout the BMA and in the immediately surrounding area. As such, from a screening perspective, the applicable groundwater criteria will also be applied to surface water for the purposes of this assessment.

Table 6.3: Adopted PFAS Criteria for OMP – Water

Adopted Tier 1 Screening Criteria	Relevant Environmental Value	PFOS/PFHxS	PFOA
Freshwater: High conservation/ecological value systems (99% species protection)	Water Dependent Ecosystems and Species	0.00023 µg/L	19 µg/L
Freshwater: Slightly to moderately disturbed systems (95% species protection)		0.13 µg/L	220 µg/L
Drinking water	Potable Water Supply (Desirable), Traditional Owner Cultural Values, Agriculture and Irrigation (Irrigation and Stock Watering)	0.07 µg/L	0.56 µg/L
Recreational water	Water-based Recreation (Primary Contact Recreation, Secondary Contact, Aesthetic Enjoyment)	2 µg/L	10 µg/L

HEPA (2020) has adopted trigger values or species protection levels for toxicants, which provide guidance for assessment of aquatic ecosystems. Percent species protection levels range from 80% (highly disturbed systems) to 99% (largely unmodified systems). The water bodies on and surrounding the base range in ecosystem disturbance and modification, as such different protection levels apply. The following is a general guide for adopting species protection based on water feature:

- On-base built drainage channel, swale or pipework: No species protection as protection of Environmental Values in artificial stormwater drains is not a requirement;
- On-base stormwater pond, dam or depression: 95% species protection adopted as vegetation is generally present in and around the moderately to highly modified feature which supports a freshwater ecosystem; and
- Off-base water bodies (i.e. rivers, creeks and oxbows): 99% species protection adopted.

For the purposes of this report and as advised in HEPA (2020), the 99% species protection level has been adopted to be protective of bioaccumulation and biomagnification in wildlife (i.e. indirect toxicity), whilst the 95% species protection level is still relevant to direct toxicity for slightly to moderately disturbed ecosystems.

In the absence of a published guideline value for stock watering, the drinking water values have been considered as an initial screening value, as is consistent with the HHERA (Golder 2020).

No criteria have been adopted for the environmental values *Potable Mineral Water Supply*, *Industrial and Commercial*, *Aquaculture*, or *Geothermal Properties*, as these uses are considered unlikely to be present within the Management Area. Additionally, no criteria have been adopted for the environmental value *Buildings and Structures*, as no PFAS criteria have been developed for this scenario.

No ecological or human health guidelines have currently been developed for PFAS in sediments by any Australian Regulatory body and as such, sediment results have not been assessed against criteria during this program.

7. Monitoring Data Summary

The following sections detail the rainfall, groundwater, surface water and sediment monitoring data collected during the five OMP sampling events.

All data has been extracted from the Stantec Factual Reports, full copies of which have been provided in **Appendix C** through **Appendix G**.

7.1 Rainfall

7.1.1 Rainfall During OMR Period (2021 to 2023)

As noted in **Section 2.6**, the average annual rainfall at Wodonga (weather station 082056, approximately 2.7 km to the west) is approximately 710 mm. The annual rainfalls experienced during the OMR period are as follows: 2021 – 832.9 mm, 2022 – 1,140.9 mm and 2023 – 779.6 mm.

Plate 1 below plots the monthly rainfall from 2021 through 2023 against the long-term monthly averages.

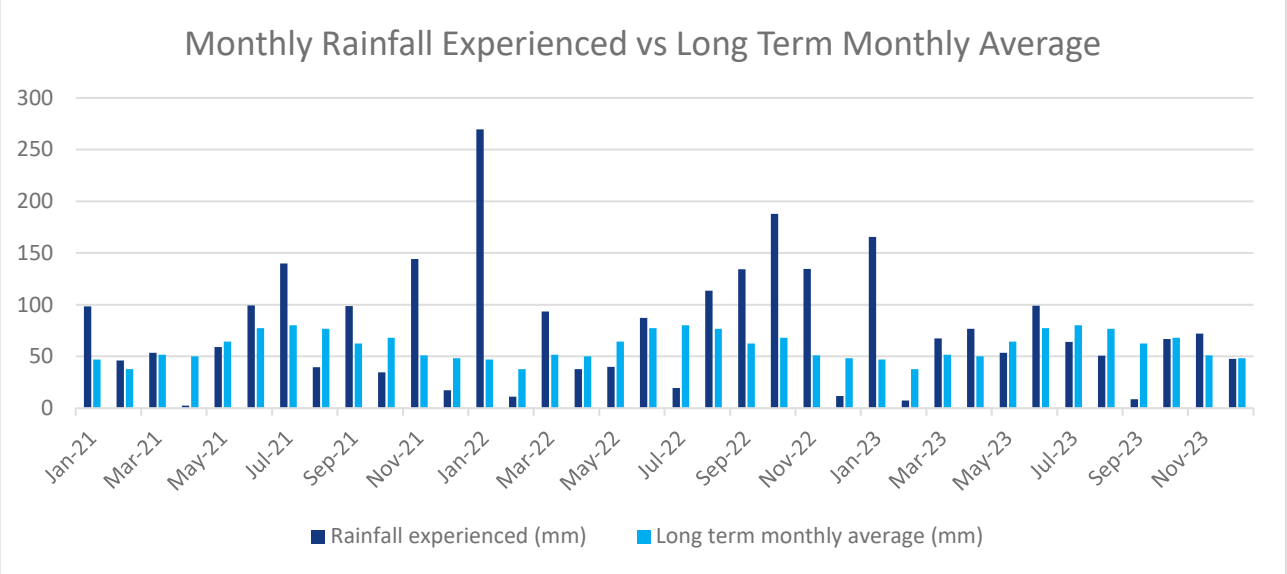

Plate 1: Monthly rainfall experienced vs long term monthly averages (2021-2023).

As shown above, all three years of the OMR recorded above average rainfall, with 2022 being particularly wet. A moderate La Nina weather event, weakening to a weak La Nina during 2023, occurred during this period.

7.1.2 Rainfall During Individual Sampling Events

The PMAP (Defence 2020) recommends that OMP surface water sampling is completed after a reasonable rain event (i.e. 35 mm of rain over a 4-day period) if possible, as many of the water bodies targeted by the OMP are ephemeral. **Table 7.1** below details the rainfall which occurred within the region immediately prior to and during the OMP sampling events.

Table 7.1: Rainfall During Sampling Events

Sample Event	Surface Water Sampling	Rainfall Measurements from Closest Weather Station during Sample Event[1]
E1	8 to 17 November 2021	31.4 mm of rain was recorded in the seven days prior to sampling, with 51.8 mm of rain during the sampling period.
E2	2 to 9 May 2022	9.6 mm of rain was recorded in the seven days prior to sampling, with 1.0 mm of rain during the sampling period.

Sample Event	Surface Water Sampling	Rainfall Measurements from Closest Weather Station during Sample Event[1]
E3	10 to 15 October and 10 November 2022	36.8 mm of rain was recorded in the seven days prior to the sampling in October, with 59.0 mm of rain during the sampling period. 2.6 mm of rain was recorded in the seven days prior to the sampling in November, with no rain during the sampling period.
E4	1 to 6 May 2023	4.4 mm of rain was recorded in the seven days prior to the sampling, with 15.8 mm of rain during the sampling period.
E5	23 to 27 October and 27 to 28 November 2023	No rain was recorded in the seven days prior to the sampling in October, with 0.2 mm of rain during the sampling period. 17.2 mm of rain was recorded in the seven days prior to the sampling in November, with no rain during the sampling period.

Notes:

1. Rainfall measurements were taken from weather station (082056) at Wodonga, the closest BoM station to the base (approximately 2.7 km to the west).

Several of the sampling events were completed during periods of low to no rainfall, with efforts made to return to base following a rain event to complete additional sampling. Weather limitations have contributed to some surface water sampling locations being dry during sample events.

7.2 Groundwater

7.2.1 Groundwater Elevations and Flow Direction

Groundwater elevation contour plots from the five monitoring events are presented in **Figure 6A**, **Figure 7A**, **Figure 8A**, **Figure 9A** and **Figure 10A** respectively. Groundwater flow direction remains relatively consistent across the monitoring period and are also consistent with the expected directions as described in **Section 3.2.2**. Groundwater elevations by aquifer interval for each monitoring round have been summarised in **Table 7.2** and **Table 7.3** below. Overall, the following observations are made in relation to the groundwater contours derived from the monitoring undertaken:

- Shepparton Colluvium – Shallow Wells (South Bandiana and North Bandiana): West and north westerly flow towards Jack in the Box Creek;
- Shepparton and Coonambidgal Fluvium – Shallow Wells (North Bandiana and East Bandiana): North easterly flow towards the Kiewa River; and
- Shepparton and Coonambidgal Fluvium – Intermediate and Deep Wells (North Bandiana and East Bandiana): insufficient wells, or insufficiently spaced wells to prepare flow contours based on OMP data. Groundwater flow direction is known to be to the northeast towards the Kiewa River based on information from the DSI Addendum (JBS&G 2024a) and Mass Flux Study (JBS&G 2024b).

Table 7.2: Summary of Groundwater Elevation – Shepparton Colluvium

Event	Groundwater Elevation Range (m AHD)	
	Perched	Shallow
E1	166.251	151.411 (MW361) to 166.536 (MW342)
E2	*Dry*	151.58 (MW361) to 166.734 (MW342)
E3	166.881	152.171 (MW361) to 168.084 (MW329)
E4	[1]	152.021 (MW361) to 167.315 (MW342)
E5	*Not sampled*	154.069 (MW357) to 165.028 (MW346)

Note:

1. The elevation of 181.368 metres Australian Height Datum (mAHD) has been provided in the contour figure of the Factual Report, however MW056 does not appear on the gauging sheet to cross reference this number. As this elevation is significantly different from other sampling rounds and is well above the surface level at this position of the base, it will not be included in this OMR.

Table 7.3: Summary of Groundwater Elevation – Shepparton and Coonambidgal Fluvium

Event	Groundwater Elevation Range (m AHD)		
	Shallow	Intermediate	Deep
E1	153.648 (MW357) to 164.071 (MW346)	158.866 (MW046_I) to 159.273 (MW009)	158.302 (MW046_D) to 160.383 (MW350_D)
E2	153.377 (MW357) to 163.934 (MW346)	158.821 (MW046_I) to 159.156 (MW009)	158.185 (MW046_D) to 160.297 (MW350_D)
E3	154.966 (MW357) to 165.045 (MW346)	159.506 (MW046_I) to 160.017 (MW009)	158.941 (MW046_D) to 161.478 (MW350_D)
E4	153.359 (MW357) to 163.969 (MW345)	158.912 (MW046_I) to 159.309 (MW009)	158.327 (MW046_D) to 160.238 (MW350_D)
E5	151.944 (MW361) to 167.461 (MW342)	158.968 (MW046_I) to 159.346 (MW009)	158.428 (MW046_D) to 160.534 (MW350_D)

Groundwater elevation measured in the shallow, intermediate and deep wells of the Shepparton and Coonambidgal Fluvium aquifer in East Bandiana had comparable groundwater elevations, demonstrating interconnectivity between the different well intervals. This confirms the observations from groundwater gauging undertaken as part of the DSI Addendum investigation (JBS&G 2024a).

As detailed in **Section 7.1**, rainfall during 2022 was notably higher compared to 2021 and 2023. This increase in rainfall is generally reflected as a rise in groundwater levels across the base during 2022 compared to 2021/2023. This trend was identified in both the Shepparton Colluvium and Shepparton and Coonambidgal Fluvium aquifers, although the influence was observed to be greater in areas where groundwater was close to the surface (central and eastern portions of the base) compared to areas of deeper groundwater (northern and southern portions of the base where topography is more elevated). This relationship and its influence on analytical results has been further discussed in **Section 9.1.2**.

It is noted that based on the current monitoring program, the groundwater flow direction in the shallow Shepparton Colluvium aquifer is difficult to accurately calculate as there is only one well (MW342) monitored in this part of the base. It would be beneficial to include additional North Bandiana wells screened within this geology as part of the OMP program to ensure accurate groundwater flow contours calculation.

7.2.2 Groundwater Physiochemical Field Parameters

An overview of field parameters recorded in groundwater by Stantec as part of the monitoring is summarised in **Table 7.4**, while ranges have been provided in detail in **Appendix I**.

Table 7.4: Overview of Recorded Field Parameters

Aquifer	On-base	Off-base
Shepparton Colluvium Perched	The perched water has neutral pH, poor to good aerobic conditions, fresh water and moderately reducing to anaerobic redox conditions, although it is noted that only two data points are available.	Not monitored off-base.
Shepparton Colluvium Shallow	pH ranges from acidic to alkaline, dissolved oxygen indicates hypoxic to excellent	Off-base conditions have pH range from acidic to neutral, dissolved oxygen

	aerobic conditions, salinity ranges from fresh to saline and anaerobic to oxidising conditions.	indicates hypoxic to poor aerobic conditions, only fresh water conditions are encountered and anaerobic to moderately reducing conditions are present.
Shepparton and Coonambidgal Fluvium Shallow	pH ranges from moderately acidic to neutral, dissolved oxygen indicates hypoxic to good aerobic conditions, salinity ranges from fresh to saline water and anaerobic to oxidising conditions.	Off-base conditions are similar although dissolved oxygen indicates hypoxic to poor aerobic conditions and only fresh conditions are encountered.
Shepparton and Coonambidgal Fluvium Intermediate	This interval is slightly acidic, predominantly hypoxic to poor aerobic conditions, with fresh water conditions and redox conditions ranging from anaerobic to moderately reducing.	Not monitored off-base.
Shepparton and Coonambidgal Fluvium Deep	The deep interval exhibits slightly acidic pH, dissolved oxygen levels are hypoxic to excellent aerobic conditions, with fresh water conditions and redox values ranging from anaerobic to oxidising conditions.	Not monitored off-base.

7.2.3 Laboratory Results

Groundwater analytical results obtained from analysis of groundwater samples obtained by Stantec in the five monitoring rounds have been tabulated in comparison to relevant criteria in T1: OMP Groundwater Analytical Summary Table (2021-2023) – in the **Tables** section of this report, summarised in **Table 7.5** below**.**

It is noted that **Table 7.5** states which wells exceed criteria in each sampling event. Analysis of trends and a discussion of the results in the context of the overall program is provided in **Section 9**.

Table 7.5: Summary of Groundwater Analytical Results Exceedances

Analyte	Conc. Range (ug/L)	Summary of Groundwater Analytical Results
Shepparton Colluvium – Perched – On-base		
PFOS	0.3 to 0.84	• Concentrations at MW056 were reported above the PFAS NEMP 2020 Freshwater (99% and 95% Protection) criterion in both monitoring events.
PFOA	0.04 to 0.15	• No criteria exceedances were identified for PFOA.
Sum of PFHxS and PFOS	0.53 to 1.50	• Concentrations at MW056 were reported above the PFAS NEMP 2020 Drinking Water criterion in all monitoring events.
Shepparton Colluvium – Shallow – On-base		
PFOS	LOR to 983	• Concentration at all locations in all monitoring events were reported above the PFAS NEMP 2020 Freshwater (99% Protection) criterion, although it is acknowledged that concentrations in all events at MW315, MW323 and MW416 and one or more monitoring events for MW051, MW304, MW311 and MW312 were below the LOR; and • Concentration at MW307, MW319, MW321 and MW342 in all monitoring events and MW304 during the October 2022 and May 2023 monitoring events, were reported above the PFAS NEMP 2020 Freshwater (95% Protection) criterion.

Analyte	Conc. Range (ug/L)	Summary of Groundwater Analytical Results
PFOA	LOR to 66	• Concentrations at MW307 during all monitoring events except October 2022, were reported above the PFAS NEMP 2020 Freshwater (99% Protection) criterion; • Concentrations at MW307 during all monitoring events except October 2022 and MW321 during the October/November 2023 sampling event, were reported above the PFAS NEMP 2020 Recreational Water criterion; and • Concentrations at MW307 during all monitoring events and MW321 during the October/November 2023 sampling event, were reported above the PFAS NEMP 2020 Drinking Water criterion.
Sum of PFHxS and PFOS	LOR to 1,180	• Concentrations at MW307 and MW342 during all sampling events and MW321 during the October/November 2023 sampling event, were reported above the PFAS NEMP 2020 Recreational Water criterion; and • Concentrations at MW307, MW312, MW319, MW321, MW326, MW328, MW329, MW342 during all monitoring events and MW051 and MW304 during one or more monitoring events, were reported above the PFAS NEMP 2020 Drinking Water criterion.
Shepparton and Coonambidgal Fluvium – Shallow – On-base		
PFOS	LOR to 104	• Concentration at all locations in all monitoring events, were reported above the PFAS NEMP 2020 Freshwater (99% Protection) criterion, although it is acknowledged that concentrations in three monitoring events for MW346 were below the LOR; and • Concentration at all locations in all monitoring events, with the exception of one or more monitoring events for MW012, MW018, MW345, MW346, MW351, MW352 and MW354, were reported above the PFAS NEMP 2020 Freshwater (95% Protection) criterion.
PFOA	LOR to 12.2	• Concentrations at MW404 during May 2023 and Oct 2023 and MW052 during October 2023 (considered an anomaly, based on resampling) were reported above the PFAS NEMP 2020 Recreational Water criterion; • Concentrations at MW350_S, MW403 and MW404 in all monitoring events were reported above the PFAS NEMP 2020 Drinking Water criterion; and • Concentrations at MW035, MW043, MW052 and MW353 in one or more (but not all) monitoring events were reported above the PFAS NEMP 2020 Drinking Water criterion.
Sum of PFHxS and PFOS	LOR to 214	• Concentrations at MW016, MW020, MW035, MW043, MW052, MW350_S, MW353, MW403 and MW404 in all monitoring events and MW034 in the November 2021 and May 2022 monitoring events, were reported above the PFAS NEMP 2020 Recreational Water criterion; and • Concentrations at MW012, MW018, MW029, MW034, MW345 and MW354 in all monitoring events and MW346 in the October 2022 monitoring event, were reported above the PFAS NEMP 2020 Drinking Water criterion.
Shepparton and Coonambidgal Fluvium – Intermediate – On-base		
PFOS	1.54 to 9.98	• Concentration at all locations in all monitoring events were reported above the PFAS NEMP 2020 Freshwater (99% and 95% Protection) criterion.
PFOA	0.05 to 0.71	• The concentration at MW009 in the October 2023 monitoring event was reported above the adopted PFAS NEMP 2020 Drinking Water criterion; and • Concentrations at MW042 in November 2021, May 2022 and October 2022 monitoring events were reported above the adopted PFAS NEMP 2020 Drinking Water criterion.
Sum of PFHxS and PFOS	2.64 to 20.2	• Concentration in all three wells in all monitoring events were reported above the PFAS NEMP 2020 Drinking Water and PFAS NEMP 2020 Recreational Water criterion.
Shepparton and Coonambidgal Fluvium – Deep – On-base		

Analyte	Conc. Range (ug/L)	Summary of Groundwater Analytical Results
PFOS	0.28 to 3.24	• Concentrations at all locations in all monitoring events were reported above the PFAS NEMP 2020 Freshwater (99% and 95% Protection) criterion.
PFOA	0.02 to 0.19	• No criteria exceedances were identified for PFOA.
Sum of PFHxS and PFOS	0.53 to 5.5	• Concentrations at all locations in all monitoring events were reported above the PFAS NEMP 2020 Drinking Water criterion. • Concentrations at MW350_D in all monitoring events were reported above the PFAS NEMP 2020 Recreational Water criterion.
Shepparton Colluvium – Shallow – Off-base		
PFOS	LOR to 0.1	• Concentrations at all locations in all monitoring events were reported above the PFAS NEMP 2020 Freshwater (99% Protection) criterion, although it is acknowledged that concentrations within MW313 during the November 2021 monitoring event were below LOR.
PFOA	LOR to 0.01	• No criteria exceedances were identified for PFOA.
Sum of PFHxS and PFOS	LOR to 0.21	• Concentrations at both MW360 and MW361 in all monitoring events were reported above the PFAS NEMP 2020 Drinking Water criterion.
Shepparton and Coonambidgal Fluvium – Shallow – Off-base		
PFOS	LOR to 0.04	• Concentrations at MW357 in all monitoring events were reported above the PFAS NEMP 2020 Freshwater (99% Protection) criterion, but below 95% Protection.
PFOA	LOR	• No criteria exceedances were identified for PFOA.
Sum of PFHxS and PFOS	LOR to 0.08	• The concentration in MW357 during May 2023 was reported above the PFAS NEMP 2020 Drinking Water criterion.

7.3 Surface Water

7.3.1 Surface Water Quality Field Parameters

Surface water field parameters as recorded by Stantec during the five monitoring rounds reviewed has been summarised in **Appendix I**. The field parameters from the monitoring events during the OMR indicate that:

- On-base pH ranged between 5.97 and 8.96, while off-base pH ranged between 6.01 and 8.43. On-base surface water locations had more acidic conditions than off-base, but were generally comparable;
- On-base DO levels ranged between 1.37 mg/L and 9.74 mg/L, while off-base ranged between 1.29 mg/L and 10.05 mg/L. Off-base locations were similar to on-base DO levels;
- On-base TDS levels ranged between 10.14 mg/L and 466.7 mg/L, while off-base TDS ranged between 18.59 mg/L and 990 mg/L. Off-base locations were similar to on-base TDS levels; and
- On-base and off-base redox conditions were within similar ranges with on-base redox conditions ranging between -161.5 mV and 251.9 mV, while off-base redox conditions ranged between -264.9 mV and 197.3 mV.

7.3.2 Laboratory Results

Surface water analytical results for the five Stantec monitoring rounds have been tabulated in comparison to relevant criteria in T2: OMP Surface Water Analytical Summary Table (2021-2023) in the **Tables** section of this report and is summarised in **Table 7.6** on the following page**.**

Analysis of trends and a discussion of the results in the context of the overall program has been provided in **Section 9**.

Table 7.6: Summary of Surface Water Analytical Results Exceedances

Analyte	Conc. Range (ug/L)	Summary of Groundwater Analytical Results
On-base		
PFOS	LOR to 13.8	• All sample locations during all sampling events were reported above the PFAS NEMP 2020 Freshwater (99% Protection) criterion, although it is acknowledged that concentrations at SW382 were below the LOR; and • SW311, SW313, SW321, SW322, SW323, SW324, SW326, SW336, SW338, SW340, SW346, SW349 and SW448 in all monitoring events and SW307, SW310, SW316, SW332, SW333, SW355, SW370, SW380, SW387 and SW388 in one or more sampling events, were reported above the PFAS NEMP 2020 Freshwater (95% Protection) criterion.
PFOA	LOR to 1.17	• SW336 during the May 2023 and October 2023 monitoring events exceeded PFAS NEMP 2020 Drinking Water criterion.
Sum of PFHxS and PFOS	LOR to 15.9	• SW313 and SW336 in all monitoring events and SW311, SW321, SW322, SW324, SW326, SW332, SW340 and SW448 in one or more monitoring event, were reported above the PFAS NEMP 2020 Recreational Water criterion; and • All sample locations during all sampling events, with the exception of SW332, SW374, SW375, SW382 and SW387 during one or more monitoring events, were reported above the PFAS NEMP 2020 Drinking Water criterion.
Off-base		
PFOS	LOR to 4.13	• All sample locations during all sampling events, were reported above the PFAS NEMP 2020 Freshwater (99% Protection) criterion, although it is acknowledged that concentrations at SW390, SW393, SW398, SW404, SW416, SW430, SW434 and SW462 were below the LOR; and • SW396, SW397, SW400, SW424, SW463, SW471 and SW487 in all monitoring events and SW379, SW395, SW401, SW403, SW405, SW427, SW431, SW462 and SW470 in one or more sampling events, were reported above the PFAS NEMP 2020 Freshwater (95% Protection) criterion.
PFOA	LOR to 0.34	• No criteria exceedances were identified for PFOA.
Sum of PFHxS and PFOS	LOR to 8.31	• SW397 and SW487 in all monitoring events and SW396, SW463 and SW471 in one or more monitoring event, were reported above the PFAS NEMP 2020 Recreational Water criterion; and • SW379, SW396, SW397, SW400, SW401, SW424, SW463, SW470, SW471 and SW487 in all monitoring events and SW395, SW398, SW403, SW405, SW409, SW412, SW427, SW430, SW431, SW432 and SW462 in one or more sampling events, were reported above the PFAS NEMP 2020 Drinking Water criterion.

7.4 Sediment

7.4.1 Summary of Field Observations

Based on the two sediment monitoring events in May 2022 and May 2023, the sediment observed on-base is predominantly orange brown to grey brown silty clay or sandy clay with low to high plasticity and generally contained organic matter. The sediment sampled on-base did not report any odours or staining. Based on the field notes, the on-base water bodies were a mix of flowing and stagnant water bodies, and frothing (which can be an indicator of PFAS presence) was generally not identified.

The sediment observed off-base is predominantly low to high plasticity silty clay and sandy clay, varying in colour from dark brown to grey brown and generally contained organic matter. The sediment sampled off-base did not report any odours or staining. The water bodies where samples were collected were a mix of flowing and stagnant water bodies, and frothing was generally not identified.

7.4.2 Laboratory Results

Sediment analytical results for the two Stantec monitoring rounds have been tabulated in T3: OMP Sediment Analytical Summary Table (2021-2023) in the **Tables** section of this report and summarised in **Table 7.7** on the following page**.** The results indicate that:

- The highest PFAS concentrations in sediment were reported for an offsite location;
- The highest on-base concentration was detected in South Bandiana, in the waterway which drains Source Area 6 and 7, before flowing off-base towards Jack in the Box Creek; and
- The highest concentrations off-base were identified in the oxbow lakes in the Kiewa River floodplain, directly east of East Bandiana.

A full review of the analytical results in the context of the overall program has been provided in **Section 9**.

Table 7.7: Summary of Sediment Analytical Results

Monitoring Period	PFOS Concentrations Range (mg/kg)	PFOA Concentrations Range (mg/kg)	Sum of PFOS and PFHxS Concentrations Range (mg/kg)
On-base			
E2	LOR (SD382) to 0.0167 (SD323)	LOR (All)	LOR (SD382) to 0.0173 (SD323)
E4	LOR (Multiple) to 0.0129 (SD323)	LOR (All)	LOR (Multiple) to 0.0137 (SD323)
Off-base			
E2	0.0014 (SD412) to 0.0196 (SD397)	LOR (Multiple) to 0.0004 (SD397)	0.0014 (SD412) to 0.0442 (SD397)
E4	0.002 (SD412) to 0.0666 (SD397)	LOR (Multiple) to 0.0021 (SD397)	0.002 (SD395/SD412) to 0.0861 (SD397)

8. Other Data and Information

In the period between 2020 and 2023, Defence engaged consultants to progress other investigations as part of implementation of the PMAP. The following sections outline the works undertaken at the base, that are relevant in providing additional information and data that can assist in interpretation of the OMP results.

8.1 DSI Addendum

8.1.1 Background and Objective

The DSI Addendum (JBS&G 2024a) was completed by JBS&G to gather additional data for the PFAS Source Areas, particularly Source Area 6 in South Bandiana and Source Area 13 in East Bandiana, along with an assessment of PFAS migration pathways to support PMAP Response Actions and to inform a Remedial Action Plan (RAP). The objectives were to further define the extent and mobility of PFAS within specific Source Areas and to characterise migration pathways from these areas to off-base locations.

8.1.2 Soil Results

The investigation identified PFAS concentrations in soil below and immediately around the facility infrastructure at both Source Area 6 and 13, which reduced significantly with distance from the infrastructure. Due to the clayey geology, PFAS primarily occurred within the top 1.0 m of soil at Source Area 6, while a sandier geology at Source Area 13 allowed PFAS to migrate deeper to the extent of soil investigation of 4.0 m. Investigations of Source Area 14 and 15 and the Diffuse Sources within East Bandiana did not identify significant nor wide-spread PFAS impacts.

8.1.3 Surface Water Results

PFAS was also identified around stormwater infrastructure associated with Source Areas 6 and 13. PFAS was found to be readily mobilised from different media (soil, concrete and asphalt, porewater) and was present in surface water runoff. Investigations into drainage infrastructure and topography found direct pathways via surface water from Source Area 6 to Jack in the Box Creek and from Source Area 13 to the oxbows in the Kiewa River floodplain.

8.1.4 East Bandiana Aquifer Characterisation Results

Furthermore, the aquifer characterisation investigation conducted across East Bandiana and the off-base land immediately to the north, identified a zone of sand at a depth of approximately 11-14 mbgl. PFAS concentrations are generally an order of magnitude higher in the sand interval compared to those reported in shallow wells. The sand interval has a relatively high hydraulic conductivity (10-20 m/day) and appears to be generally continuous across East Bandiana although its thickness is variable. Through the use of survey, geochemical and PFAS data, it is considered that this aquifer intercepts the oxbow lakes in the Kiewa River floodplain to the north of the base. This finding was one of the key outcomes for this investigation as it further developed the CSM and updated the previously proposed interconnected sand stringer theory (as identified in the DSI (Golder 2018)).

8.1.5 CSM Update

Through the DSI Addendum (JBS&G 2024a), JBS&G confirmed the key CSM pathway for the migration of PFAS off the base for South and North Bandiana was via surface water. The key migration pathways for East Bandiana were both surface water and groundwater, although, based on previous development work across this portion of the base, it was considered unlikely that significant PFAS mass was migrating via the surface water pathway. This was confirmed as part of the Mass Flux Study (JBS&G 2024b) (see **Section 8.2**).

Overall, PFAS concentrations in soil, sediment, groundwater and surface water at the site were comparable to previous studies (i.e. DSI (Golder 2018) and HHERA (Golder 2020)), with no change in the risk profile for on-

base or off-base receptors. As such, JBS&G did not identify contamination which poses a risk of harm that requires immediate remedial or management responses on base or within the Management Area.

8.1.6 Remedial Response

The DSI Addendum (JBS&G 2024a) indicated that future works should focus on reducing PFAS migration from the base through remediation and/or management, along with ongoing monitoring of PFAS concentrations and land use across the Management Area (to ensure an ongoing low and acceptable risk level). The DSI Addendum (JBS&G 2024a) indicated that an appropriate remedial response to address the PMAP Management Action will likely involve a combination of Source Area and impacted pathway remediation and/or management.

8.2 Mass Flux Assessment

8.2.1 Background and Objective

The Mass Flux Study (JBS&G 2024b) was completed by JBS&G over an approximate twenty-one-month period extending from July 2022 through to April 2024. The primary objective of the Mass Flux Study was to support closing out Action 1 and 2 of the PMAP, although the specific objectives of the investigation included:

- Quantifying the overall annual PFAS mass flux from the base to off-base areas:
    - Via overland flow and the base stormwater network; and
    - Via groundwater flow.
- Further understanding of baseline concentrations of PFAS migrating off-base in order to allow post remediation comparison;
- Further quantify the contribution of PFAS into stormwater and groundwater from Source Areas to inform future implementation of PMAP Actions (i.e. a RAP); and
- Quantify overland flow and stormwater flow during peak flow events and determine the seasonality of PFAS mass flux from the base.

8.2.2 Mass Flux Study Results

Through the completion of the Mass Flux Study, there is now a comprehensive understanding of the pathways through which PFAS discharges off-base and the estimated flux through these pathways. The Mass Flux Study confirmed the CSM pathway findings of the DSI Addendum (JBS&G 2024a), in that the primary off-base PFAS migration pathway for South and North Bandiana was via surface water, while the primary pathway for East Bandiana was via groundwater. This relationship is evident in the estimated mass flux numbers provided in **Table 8.1** below, although it is noted that surface water mass flux is approximately 30% higher than would occur on an average non-La Nina year.

Table 8.1: Estimated Mass Flux Summary

Base Area	Media	Approximate Mass Flux – Sum of PFHxS and PFOS (g/year)	Approximate Mass Flux – Sum of PFAS (g/year)
South Bandiana	Groundwater	<1	<1
	Surface water[1]	362	434
North Bandiana	Groundwater	1	1
	Surface water[2]	338	461
East Bandiana	Groundwater	66	93
	Surface water	2	4
	Sewerage	3	3

Note:

1. Surface water calculations relate only to the western portion of South Bandiana, based on the hydraulic divide that runs through this portion of the base.
2. The surface water exiting from the North Bandiana boundary is a combination of flows from the eastern portion of South Bandiana (see comment above), plus flows from North Bandiana.

It is noted that the Mass Flux Study did not identify a seasonal concentration/flux trend and only slightly higher PFAS concentrations were observed in the 'first flush' samples of the study.

While the Mass Flux Study provided a broader understanding of PFAS movement across the base boundaries, the Study provided further information on a sub-catchment level, highlighting the contributions of individual Source Areas. Both Source Area 1 and Source Area 7 on South Bandiana generated surface water with PFAS concentrations generally an order of magnitude higher downstream from the Source Area, compared to upstream. This indicates that surface PFAS contamination is likely more widespread than previously characterised in the DSI (Golder 2018) and DSI Addendum (JBS&G 2024), and as such, further investigation of these areas is underway.

8.2.3 Remedial Response

The DSI Addendum (JBS&G 2024a) indicated an appropriate remedial response to reduce PFAS migration from the base would likely involve a combination of Source Area and impacted pathway remediation and/or management. The Mass Flux Study (JBS&G 2024b) confirmed this conclusion and assisted in refining the understanding of Source Areas and pathways requiring attention.

9. Discussion

The following section discusses the results of the five OMP sampling events in the context of the observed field and analytical trends and their setting in the broader PMAP program.

The short-term PFAS trends observed are consistent with climatic trends and the current CSM, and therefore statistical trend analysis of the data has not been completed. Whilst statistical trend analysis can provide a robust assessment of long-term trends, they are not suited to assessing short-term fluctuating trends, nor do they consider other factors relevant to the CSM, such as climatic conditions and groundwater level fluctuations.

9.1 Groundwater

9.1.1 Analytical Results Based on Base Conceptual Understanding

Based on the revised CSM (see **Section 3**), groundwater is the primary PFAS migration pathway for East Bandiana and contributes to surface water PFAS concentrations in the oxbow lakes located on the Kiewa River floodplain. However, groundwater is not a key migration pathway for North and South Bandiana, primarily due to the Shepparton Colluvium consisting mainly of clay materials which results in limited vertical and lateral PFAS migration.

A discussion of the OMP results taking into account the revised CSM are set out in **Table 9.1**. Groundwater sampling locations have been grouped by Source Areas/area of interest. Source Areas are shown in **Figure 2**, while groundwater sampling locations are shown in **Figure 4**.

Table 9.1: Interpretation of Groundwater OMR Results

Sample Location/s	Target Area	Monitoring Undertaken	Discussion of Results and Screening Criteria Exceedances	Rationale for Observed Results/Changes
Shepparton Colluvium – Perched – On-base				
MW056	Source Area 9	This sampling location targets the shallow perched water located in Source Area 9. Only two samples have been collected during the five monitoring rounds.	Results have been relatively consistent, ranging from 0.53 to 1.5 µg/L for Sum of PFHxS+PFOS, which exceeds the PFAS NEMP 2020 Drinking Water criterion.	The difference in concentration between sample rounds is not considered to be significant.
Shepparton Colluvium – Shallow – On-base				
MW315, MW317, MW318	Source Area 2	These sample locations target Source Area 2 and only one sample (MW315 in November 2021) has been collected and analysed from the five monitoring events covered in this OMR as the wells have been consistently dry.	The result from this sample was below the LOR. Downgradient wells from Source Area 2 have been sampled and analysed (MW313, approximately 200 m to the northwest) which identified PFAS concentrations just above LOR.	Source Area 2 is located in an elevated position on the slopes of Bears Hill, as such, groundwater is at considerable depth at this location (approximately 42 mbgl). Based on the single result, the limited PFAS in soil within this Source Area has not migrated through soil to groundwater. These results confirm the results of the Mass Flux Study (JBS&G 2024b) that surface water and not groundwater, is the primary pathway for this portion of South Bandiana.
MW311, MW304, MW307	Source Area 1	Monitoring wells MW307 and MW311 are located within Source Area 1, with MW304 being located further north and represents groundwater leaving the base to the north.	The analytical results have been relatively consistent across the five OMR sampling rounds, with the exception of MW307 which had two sample rounds slightly different in the latter two years. • MW307 results ranged from 72 to 950 µg/L for Sum of PFHxS+PFOS (all exceeding PFAS NEMP 2020 Recreational Water criterion); • MW304 results range from below LOR to 0.62 µg/L for Sum of PFHxS+PFOS (primarily exceeding PFAS NEMP 2020 Drinking Water criterion); • MW311 ranged from below LOR to 0.04 µg/L to Sum of PFHxS+PFOS (all results being less than PFAS NEMP 2020 Recreational and Drinking Water criteria).	MW307 is located immediately adjacent a bund which the DSI (Golder 2018) identifies was formerly used for firefighting activities. The highest PFAS in soil concentrations within Source Area 1 are also in the vicinity of this well. Based on the findings of the Mass Flux Study (JBS&G 2024b), further soil characterisation works are being undertaken across Source Area 1. MW304 is located directly down hydraulic gradient from MW307 and there is an approximate four orders of magnitude reduction in PFAS concentrations over the 260 m between the two locations. A slight increase has occurred for PFAS at MW304 although the most recent result was below LOR. Groundwater in the western portion of Source Area 1 (MW311) is characterised by low PFAS concentrations. Considering the elevated concentration in MW307, it is considered the OMP program would benefit from the addition of wells MW302, MW303 and MW305 to assist in delineation of groundwater results in Source Area 1. Proposed new monitoring locations have been shown on **Figure 11A**.
MW051, MW326, MW416, MW323, MW325, MW328	Source Area 6	All sampling locations are positioned within Source Area 6, with the exception of MW323 which is downgradient.	The analytical results have been relatively consistent across the five OMP sampling rounds for these wells, with the exception of MW051, which increased slightly, although the highest Sum of PFHxS+PFOS concentration remains relatively low (0.13 µg/L). Two additional wells, MW326 and MW328, have recorded Sum of PFHxS+PFOS concentrations exceeding the NEMP 2020 Drinking Water criterion, ranging from 0.18 to 0.29 µg/L.	Blocked and unavailable wells have resulted in the sampling of non-OMP wells and the establishment of new wells limiting the number of data points for each location. Monitoring wells MW325 and MW323 are downgradient of the key Source Area infrastructure and have PFAS concentrations below LOR, inferring that lateral migration of PFAS in groundwater is limited, which concurs with the findings of the DSI Addendum (JBS&G 2024a).
MW321, MW319, MW359	Source Area 7	All sampling locations are located on the downgradient boundaries of Source Area 7.	The analytical results have been relatively consistent across the five OMR sampling rounds, with the exception of a significant increase (four orders of magnitude from 0.75 to 1,180 µg/L of Sum of PFHxS+PFOS) in concentrations in MW321 between 2022 and 2023.	As a result of this increase and the findings of the Mass Flux Study (JBS&G 2024b) which identified elevated PFAS in surface water concentrations being generated from Source Area 7, further soil characterisation works are being completed within this area to provide additional context. Prior to the increase, MW321, along with all results from MW319, were relatively consistent and comparable, with results ranging from 0.09 to 0.92 µg/L, all of which exceeded PFAS NEMP 2020 Drinking Water criterion. MW359 was sampled once during the OMR period as a result on the significant PFAS increase in MW321. MW359 is further up hydraulic gradient than MW321 and did not provide any further context for the concentration increase.
MW329	Source Area 5	MW329 is located immediately to the west of Source Area 5.	The analytical results have been relatively consistent across the five OMP sampling rounds. Results ranged between 0.17 and 0.42 µg/L for Sum of PFHxS+PFOS, all of which exceed PFAS NEMP 2020 Drinking Water criterion.	The results confirm that groundwater is not a significant pathway for PFAS migration in this area of the base, consistent with the findings of the DSI (Golder 2018) and the Mass Flux Study (JBS&G 2024b).
MW312	Northern boundary of South Bandiana	MW312 is located on the northern boundary of South Bandiana and provides an indication of groundwater conditions which are leaving the base to the north.	The analytical results have been relatively consistent across the five OMP sampling rounds, although concentrations in 2023 were slightly higher than 2021. Sum of PFHxS+PFOS concentrations ranged from 0.1 to 0.37 µg/L, which exceed PFAS NEMP 2020 Drinking Water criterion.	The results confirm that groundwater is not a significant pathway for PFAS migration in this portion of the base, in line with the findings of the Mass Flux Study (JBS&G 2024b).
MW342	Source Area 12	MW342 is located immediately downgradient of Source Area 12 on North Bandiana.	The analytical results have been relatively consistent across the five OMP sampling rounds. Sum of PFHxS+PFOS concentrations ranged from 4.81 and 13.5 µg/L, all of which exceed PFAS NEMP 2020 Recreational Water criterion.	While the groundwater results are elevated compared to other areas of the base, downgradient and boundary wells have lower or below LOR results, indicating PFAS concentrations are delineated. Based on review of the data, the OMP program would benefit from monitoring of additional groundwater wells which are closer to MW342, other than the current boundary wells. MW343 and MW344 are additional down-gradient wells in closer proximity which could be added to the program that would assist in delineation of the elevated results at MW342. The inclusion of these wells would also assist is providing

©JBS&G Australia Pty Ltd

Sample Location/s	Target Area	Monitoring Undertaken	Discussion of Results and Screening Criteria Exceedances	Rationale for Observed Results/Changes
				sufficient data to calculate groundwater flow direction in this portion of the base. Proposed new monitoring locations have been shown on **Figure 11B.**
Shepparton Colluvium – Shallow – Off-base				
MW313	Western boundary of South Bandiana	MW313 is located close to the western boundary of South Bandiana between the base and Wodonga South. As indicated above, the well is also used to provide downgradient data for the dry wells located in Source Area 2.	Analytical results from MW313 have recorded Sum of PFHxS+PFOS concentrations below LOR, or just above LOR (0.02 µg/L),	Results confirm that PFAS in groundwater is not a significant pathway across this portion of the base boundary.
MW360, MW361	Jack in the Box Creek Catchment	MW360 and MW361 are located along the Jack in the Box Creek alignment, approximately 1.0 km and 2.5 km downgradient from the base boundary respectively and are sampled to assist in understanding potential groundwater/ surface water interactions.	The analytical results have been relatively consistent for both wells across the five OMP sampling rounds, with Sum of PFHxS+PFOS concentrations ranging from 0.11 to 0.21 µg/L, which consistently exceed PFAS NEMP 2020 Drinking Water criterion. There is not a significant difference in PFAS results between the two wells, despite being approximately 1.5 km apart.	The corresponding surface water OMP locations, SW427 and SW430 respectively, record very similar PFAS concentrations to the wells at each location, although the water parameters readings differ.
Shepparton and Coonambidgal Fluvium – Shallow – On-base				
MW345, MW346	Western boundary of North Bandiana	These wells are in the western portion of North Bandiana, with MW346 on the base boundary and MW345 approximately 250 m off-base.	The analytical results have been relatively consistent for MW345 across the five OMP sampling rounds, with Sum of PFHxS+PFOS concentrations ranging from 0.25 to 0.34 µg/L, which all exceed PFAS NEMP 2020 Drinking Water criterion. MW346 had one event (October 2022) that exceeded PFAS NEMP 2020 Drinking Water criterion at 0.17 µg/L for Sum of PFHxS+PFOS, although the other events were just above LOR, or below LOR.	The results confirm that groundwater is not a significant pathway for PFAS migration in this portion of the base, consistent with the findings of the Mass Flux Study (JBS&G 2024b). Based on review of the data, and the PFAS concentrations identified on the base boundary, it is considered beneficial to the OMP program that an additional groundwater well be installed off-base in the proximity of the Killara residential development (MW447, as shown on **Figure 11B**). This would ensure additional data is available to track a PFAS plume in groundwater if it is travelling off-base to the east. With this improved monitoring between the base and the receptor, the sampling frequency of North Bandiana wells MW345 and MW346 can be reduced from biannual to annual.
MW052, MW403, MW404, MW350_S	Source Area 13	The sample locations target Source Area 13.	The analytical results have been relatively consistent for all wells across the five OMP sampling rounds, with Sum of PFHxS+PFOS concentrations ranging from 11.0 to 214.0 µg/L, all of which exceed PFAS NEMP 2020 Recreational Water criterion.	The data identifies that the down gradient wells from the fire station facility (MW403, MW404 and MW350_S) have generally higher concentrations (approximately one order of magnitude) than the upgradient well (MW052). The OMP groundwater and surface water results confirm the current conceptual understanding of Source Area 13, as detailed in the DSI Addendum (JBS&G 2024a) and Mass Flux Study (JBS&G 2024b).
MW353, MW012, MW354. MW029	Groundwater conditions through the central portion of East Bandiana	These wells are located to assist in delineating the PFAS plume from Source Area 13.	MW353 is the most impacted well, with Sum of PFHxS+PFOS concentrations ranging from 4.94 to 18.8 µg/L, with the highest concentrations reported in the 2023 sampling events, which exceed PFAS NEMP 2020 Recreational Water criterion. It is noted that this well is directly downgradient from Source Area 13, and its PFAS concentrations are approximately one to two orders of magnitude lower than reported in the Source Area. MW012 and MW354 are also downgradient to the east of the plume, with MW029 being cross gradient to the south of the Source Area. The analytical results have been relatively consistent for all three wells across the five OMR sampling rounds, with Sum of PFHxS+PFOS concentrations ranging from 0.06 to 1.28 µg/L, the majority of which exceed PFAS NEMP 2020 Drinking Water criterion.	The delineation of the Source Area 13 PFAS plume using the OMP results is similar to the plume layout defined during the DSI Addendum (JSB&G 2024a). The East Bandiana PFAS plume has been well defined as part of the DSI Addendum (JBS&G 2024a), which identified a relatively narrow plume which is largely confined to the top-most aquifer within Source Area 13 that expands laterally and into deeper aquifers by approximately the centre of East Bandiana, then remains relatively consistent until the base boundary. The OMP well results reflect this understanding, with MW353 being close to the centre of the plume, while MW029 and MW354 are located on the southern and eastern edges of the plume respectively.
MW016, MW035, MW043, MW034, MW020, MW018	Groundwater conditions along the north central boundary of East Bandiana	The sample locations are positioned across the northern portion of East Bandiana to assist in downgradient delineation of the Source Area 13 PFAS plume in the shallow zone.	MW016, MW020, MW034, MW035 and MW043 consistently recorded Sum of PFHxS+PFOS concentrations in the range of approximately 2.0 and 17.0 µg/L (depending on their location in the plume), which exceed PFAS NEMP 2020 Recreational Water criterion. MW018, on the eastern edge of the plume, has lower Sum of PFHxS+PFOS concentrations in the range of approximately 0.6 to 0.9 µg/L, which exceeds PFAS NEMP 2020 Drinking Water criterion. Several wells, MW016 and MW035, show slightly increasing trends, while others are stable or have decreased.	Based on the results obtained, which is consistent with the results obtained during the DSI Addendum (JBS&G 2024a), the PFAS plume in shallow wells is broader than in the upgradient plume although concentrations are similar. This is likely to be a result of plume dispersion (due to the distribution of clays and sands in the shallow zone) and/or variable discharge processes within the floodplain area. Based on review of the data, the OMP program would benefit from the inclusion of additional off-base wells to ensure the continued monitoring of this plume further down-gradient of the base boundary. It is considered that the inclusion of MW411 through MW415 would benefit the program. Proposed new monitoring locations have been shown on **Figures 11B.** With this improved monitoring between the base and the receptor, the sampling frequency of all on-base wells across East Bandiana can be reduced from biannual to annual.

©JBS&G Australia Pty Ltd

Sample Location/s	Target Area	Monitoring Undertaken	Discussion of Results and Screening Criteria Exceedances	Rationale for Observed Results/Changes
MW351, MW352	Northwestern boundary of East Bandiana	The wells are located on the northwestern boundary of East Bandiana and identify concentrations flowing towards the Killara residential area. These wells also provide delineation of the Source Area 13 PFAS plume cross gradient to the north.	The analytical results have been consistent across the five OMP sampling rounds, with Sum of PFHxS+PFOS concentrations ranging from 0.01 to 0.05 µg/L, all of which are below PFAS NEMP 2020 Recreational and Drinking Water criteria.	These observations are consistent with the conceptual understanding of this portion of the base. No Source Areas were identified in this area of the base and the PFAS plume from Source Area 13 is located further to the south.
Shepparton and Coonambidgal Fluvium – Intermediate – On-base				
MW009, MW042, MW046_I	Northern boundary of East Bandiana	These wells are intended to assist in delineating the Source Area 13 plume in the intermediate zone of the aquifer.	MW009 and MW042 consistently recorded Sum of PFHxS+PFOS concentrations in the range of approximately 7.0 to 20.0 µg/L, while MW046_I was approximately 2.5 to 5.5 µg/L. All concentrations exceed PFAS NEMP 2020 Recreational Water criterion and were consistent across the five OMR sampling rounds, although the highest concentration was reported at MW009 during October 2023.	The reported concentrations for MW009 and MW042 indicate they are close to the centre of the plume, with MW046_I located to the east with slightly reduced PFAS concentrations. The DSI Addendum (JBS&G 2024a) identified that the intermediate zone at East Bandiana was continuous and generally had higher PFAS concentrations than the shallower aquifer which was dis-continuous in parts. The OMP results are consistent with these conclusions.
Shepparton and Coonambidgal Fluvium – Deep – On-base				
MW350_D	Source Area 13	The sample location is positioned in Source Area 13 to identify PFAS concentrations in the deeper portion of the aquifer.	The analytical results have been consistent across the five OMP sampling rounds, with Sum of PFHxS+PFOS concentration consistently being less than 1.0 µg/L, although exceeding PFAS NEMP 2020 Drinking Water criterion.	The PFAS concentrations in the deep well in Source Area 13 are approximately two orders of magnitude less than those in the shallow well, which is consistent with the findings of the DSI Addendum (JSB&G 2024a) which identified low hydraulic conductivity clay layers between the wells in this portion of the base.
MW046_D	Northern boundary of East Bandiana	The sample location is positioned in the northern portion of East Bandiana and is intended to assist in delineating the PFAS plume in the deep aquifer from Source Area 13.	The analytical results have been relatively consistent across the five OMP sampling rounds, with Sum of PFHxS+PFOS concentration consistently ranging from 2.5 to 5.5 µg/L, which exceeds PFAS NEMP 2020 Recreational Water criterion.	The PFAS concentrations in the deep aquifer are approximately the same as those in the overlying intermediate aquifer, which is consistent with the findings of the DSI Addendum (JSB&G 2024a) which identified interconnection between the aquifers in the northeastern portion of the base.
Shepparton and Coonambidgal Fluvium – Shallow – Off-base				
MW356, MW357	Kiewa River floodplain	The sample locations are positioned along the Kiewa River.	The analytical results have been consistent across the five OMP sampling rounds, with Sum of PFHxS+PFOS concentration consistently being below LOR, or just above LOR. One sample at MW357 during the May 2023 sampling event exceeded PFAS NEMP 2020 Drinking Water criterion with a Sum of PFHxS+PFOS concentration of 0.08 µg/L, although is not considered outside the historical range.	The Kiewa River is a gaining stream (i.e. a waterway which receives groundwater), with the monitoring wells MW356 and MW357 showing very low PFAS concentrations discharging into the river from groundwater. It is noted that sampling of surface water in the Kiewa River at or downgradient of the wells has not identified PFAS concentrations above LOR (refer to **Table 9.2**).
Other Aquifer – Off-base				
OTH019	Private Property	Groundwater location OTH019 represents a point of potential human health exposure in a private property where bore water is used for irrigation of home grown produce and stock (chickens) watering.	The analytical results have been consistent across the five OMP sampling rounds, with Sum of PFHxS+PFOS concentration consistently ranging from 0.13 to 0.22 µg/L, which exceeds PFAS NEMP 2020 Drinking Water criterion.	These concentrations are in the historical range that were taken into consideration as part of the HHERA (Golder 2020) and as such the previously assessed risk level has not changed. Risk Management Actions from the PMAP (Defence 2020) result in regular sampling of this location and ongoing stakeholder engagement with the property owner to ensure that current and potential risks relating to PFAS in groundwater are appropriately managed. Furthermore, with the PMAP program moving into a remediation phase during 2025, PFAS concentrations within the East Bandiana aquifer pathway will be subject to remediation, and therefore PFAS migration into off-base areas via groundwater will be reduced over the long term.

©JBS&G Australia Pty Ltd

With two exceptions (MW307 and MW321), overall, the groundwater results obtained from the five OMP sampling rounds are considered relatively consistent and align with the understanding of the distribution and fate and transport of PFAS in the context of the CSM (as updated following completion of the DSI Addendum (JSB&G 2024a) and the Mass Flux Study (JBS&G 2024b)).

The increases at MW307 (Source Area 1) and MW321 (Source Area 7) are currently being assessed by completion of soil characterisation works. Owing to the proximity of Source Area 1 to the base boundary, alterations will be made to the OMP to ensure that the PFAS plume is adequately monitored, although it is noted significant migration of the plume has not been identified to date. The proposed alteration is the inclusion of additional down-gradient wells from MW307, including MW302, MW303 and MW305, to ensure delineation of the PFAS plume if migration is identified.

Other identified changes to the OMP program which would assist with the program objective include:

- Off-base sampling of existing well (MW411 through MW415) to the east of East Bandiana to characterise the known PFAS plume in off-base areas. With this improved monitoring between the base and the receptor, the sampling frequency of all on-base wells across East Bandiana can be reduced from biannual to annual;
- Off-base monitoring through the provision of a new well (MW447) to the east of North Bandiana to characterise the PFAS plume prior to potentially entering the Killara residential development; and
- Monitor additional wells in North Bandiana (MW343 and MW344) to ensure adequate data is available to calculate groundwater flow contours in this portion of the base, and to delineate elevated groundwater PFAS concentrations in MW342.

Minor PFAS concentration increases and decreases (i.e. generally less than an order of magnitude) have been identified in multiple wells and require ongoing monitoring to determine if there are significant trends and if further action is warranted.

Based on the results, there does not appear to be significant migration or changes to current PFAS plumes across the Management Area, with the exception of the East Bandiana plume originating from Source Area 13 which continues to migrate to the northeast into off-base areas, although the extent (both laterally and vertically) of the plume largely remains consistent with previous investigations. This pathway will be further managed through implementation of the PMAP (Defence 2020) risk management actions (i.e. remediation) and amendment to the OMP.

9.1.2 Analytical Results Based on Weather Conditions

As noted in **Section 7.1**, above average rainfall occurred throughout the OMR period, with very high falls recorded in 2022 resulting in increased groundwater levels across some portions of the base. Standing water level increases between the November 2021 and October 2022 sampling events are summarised below (as metre difference measurements). It should be noted that standing water levels in many wells returned to a similar level to November 2021 by the May or October 2023 sampling rounds.

- **Shepparton Colluvium – Shallow**: 0.00 m in MW051 through to 1.56 m in MW329;
- **Shepparton and Coonambidgal Fluvium – Shallow**: 0.25 m in MW353 through to 1.32 m in MW357;
- **Shepparton and Coonambidgal Fluvium – Intermediate:** 0.64 m in MW046_I through to 0.74 m in MW009; and
- **Shepparton and Coonambidgal Fluvium – Deep:** 3.36 m in MW046_D through to 1.11 m in MW350_D.

While it is acknowledged that several areas of the base have shown slightly increased PFAS concentrations during the 2021-2023 period, the above average rainfall (influenced by La Nina weather conditions) should be considered. Movement of the water table, particularly at levels seen in some wells, may interact with PFAS present in soils above the water table, thus increasing PFAS concentrations in water. Importantly, PFAS is

known to accumulate at the air-water interface and as a result increasing groundwater levels will result in the previously partially saturated vadose zone becoming saturated with a resulting increase in dissolved concentrations. In this circumstance the increase is not due to a new source of contamination or due to interaction with contaminated soil and is a function of the properties of PFAS.

The influence of increased rainfall can also be seen in groundwater water parameters collected as part of the sampling events. Based on the review of the parameter data presented in the Factual Reports and the tables in **Appendix I**, it would appear that some dissolved oxygen measurements are higher and electrical conductivity measurements are lower during E2 and E3, compared to other sampling events, which is considered a result of higher recharge to the groundwater table.

Further monitoring undertaken as part of the OMP will include further comparison of rainfall, standing water levels and PFAS concentrations to assess these influences in future. While above average rainfall was noted in 2022, the limited number of wells where increased PFAS concentrations have been identified, may not persist once weather patterns return to average.

9.2 Surface Water

9.2.1 Analytical Results Based on Base Conceptual Understanding

Surface water has been identified as the primary PFAS migration pathway for North and South Bandiana and the groundwater from East Bandiana is known to daylight and become surface water off-base in the Kiewa River floodplain. As such, surface water sampling as part of the OMP is critical to monitoring PFAS movement across the base and into the Jack in the Box Creek and Kiewa River catchments.

A discussion of the OMP surface water concentrations with respect to the overall program including the CSM developed by the DSI Addendum (JBS&G 2024a) and Mass Flux Study (JBS&G 2024b) are discussed in **Table 9.2.** Surface water sampling locations from the top of the catchment are presented first, followed by those further down the catchment and are presented in groups that target Source Areas or pathways. Surface water sampling locations are shown in **Figure 5A** and **5B**.

Table 9.2: Interpretation of Surface Water OMR Results

Sample Location/s	Target Area	Monitoring Undertaken	Discussion of Results and Screening Criteria Exceedances	Rationale for Observed Results/Changes
Jack in the Box Creek Catchment – On-base				
SW302, SW307, SW310	Source Area 2	These sampling locations target Source Area 2 and the drainage channel which runs beside an internal road before converging with surface water from Source Area 1 and discharging off-base.	None of the sample locations have been sampled in all five sampling events from the OMR, with SW302 not being sampled at all, which is likely related to the steeper topography in this part of the base draining stormwater quickly away. Of the data that was obtained as part of the OMP, PFAS concentrations identified within this sub-catchment are generally consistent across sampling events, with Sum of PFHxS+PFOS concentrations ranging from 0.12 to 0.46 µg/L, which exceed the PFAS NEMP 2020 Drinking Water criterion.	The results obtained as part of the OMP are consistent with those from the Mass Flux Study (JBS&G 2024b), which did not identify Source Area 2 to be a key contributor to flux compared to other Source Areas.
SW321, SW313, SW316, SW311	Source Area 1	These sampling locations target Source Area 1, including the off-base discharge point towards Jack in the Box Creek (SW311).	The analytical results have been relatively consistent across the five OMR sampling rounds, although slight decreasing trends were identified in SW311 and SW316. The majority of sample locations consistently exceed both PFAS NEMP 2020 Recreational and Drinking Water criteria, including at the off-base discharge point (SW311) which had Sum of PFHxS+PFOS concentrations ranging from 0.2 to 2.4 µg/L.	The results obtained as part of the OMP are consistent the Mass Flux Study (JBS&G 2024b), which identified Source Area 1 to be a key contributor of PFAS to surface water, with order of magnitude increases to PFAS concentrations from surface water leaving Source Area 1, compared to surface water further upgradient (i.e. Source Area 2, see results in section above). Based on this observation further investigations are being completed in Source Area 1.
SW336	Source Area 6	SW336 is collected from the Fire Training Area settling pond.	The concentrations from this location consistently exceeding both PFAS NEMP 2020 Recreational and Drinking Water criteria, with Sum of PFHxS+PFOS concentrations ranging from 5.21 to 15.9 µg/L.	The concentrations identified during the OMR sampling period are consistent with concentrations identified during the DSI (Golder 2018). The elevated surface water concentrations identified in Source Area 6 are consistent with the DSI Addendum (JBS&G 2024a), as it is known the facility hardstand contains PFAS which is leached during rainfall and carried into the settling pond via surface water. It is noted however that the Fire Training Area is a closed system, with the base waste contractor pumping out and appropriately disposing the wastewater from the facility.
SW338, SW333	Source Area 5	These sample locations both relate to Source Area 5, with SW338 being located within the pond in the facility, while SW338 targets a drainage channel which flows west towards Jack in the Box Creek.	For the OMR sampling period, all results have consistently exceeded PFAS NEMP 2020 Drinking Water criterion, but less than Recreational criterion. Sum of PFHxS+PFOS concentrations range from 0.13 to 1.31 µg/L.	Results are consistent with historical data from the DSI (Golder 2018).
SW448, SW326, SW332, SW324, SW323, SW322	South Bandiana drainage pathway between Source Areas and base boundary	These sample locations are positioned on the main stormwater channel which collect surface water from Source Area 5, 6 and 7 and drain it towards Jack in the Box Creek. SW322 is representative of water conditions as it leaves base.	For the OMR sampling period, all results from these sampling locations have been relatively consistent with historical results, with the exception of SW326 and SW332. The majority of the sample locations within this sub-catchment exceeded PFAS NEMP 2020 Recreational and Drinking Water criteria, including SW322 on the base boundary.	The results are generally consistent with the findings of the DSI Addendum (JBS&G 2024a) and Mass Flux Study (JBS&G 2024b). These reports identified that both Source Area 6 and 7 are key contributors to PFAS in surface water, which is why elevated concentrations are being observed higher in the catchment (i.e. SW448 and SW326). As the catchment is not large and does not receive water from off-base areas, not a significant amount of dilution occurs across the sub-catchment, which sees PFAS concentrations remaining relatively similar across the sub-catchment. Both SW326 and SW332 reported a significant increase in PFAS concentrations during the OMR period. For SW326, the concentration has ranged from 0.69 µg/L to 10.1 µg/L for Sum of PFHxS+PFOS, with order of magnitude changes in concentration identified on three occasions over five sampling rounds. For SW332, the first three sampling rounds reported concentrations of Sum of PFHxS+PFOS between 0.01 and 0.1 µg/L, which then increased of an order of magnitude to 4.3 µg/L in the final sampling round. JBS&G note that these increases were not identified in the downgradient sample locations during the OMP, which remained consistent with previous rounds. As SW326 and SW332 are located in separate sub-catchments, the cause of the changes in concentration are considered unlikely to be Source Area related and may be the result of climatic and/or flow conditions.
Jack in the Box Creek Catchment – Off-base				
SW463, SW424, SW427	Upper portion of Jack in the Box Creek Catchment	SW463 and SW424 represent conditions immediately off-base in the Jack in the Box Creek catchment, with SW427 being further downstream.	All sampling location results have been relatively consistent across the sampling rounds, with the locations immediately adjacent the base boundary ranging from 0.37 to 2.35 µg/L for Sum of PFHxS+PFOS, while SW427 further downstream ranges between 0.03 and 0.53 µg/L. The majority of results exceed PFAS NEMP 2020 Drinking Water criterion, with one sample from SW463 just exceeding PFAS NEMP 2020 Recreational Water criterion.	The results of SW424 and SW463 are considered consistent with the findings of the Mass Flux Study (JBS&G 2024b) and the knowledge of the Source Areas related to each of the respective sub-catchments. It is observed that SW427 is generally an order of magnitude lower in PFAS concentrations than SW424 and SW463, which is reflective of the distance of this location from the base and dilution in the off-base stormwater system.
SW430, SW431, SW432, SW434	Lower portion of Jack in the Box Creek Catchment	These sampling locations are representative of the lower reaches of Jack in the Box Creek catchment, with SW434 representing the	All sampling location results have been relatively consistent across the sampling rounds, with Sum of PFHxS+PFOS concentrations ranging from below LOR to 0.19 µg/L, which indicates around half of the results just exceeding PFAS NEMP 2020 Drinking Water criterion.	As seen with the samples above (SW424, SW427 and SW463), there is a trend of decreasing PFAS concentrations with distance from the base, with SW434 at the discharge point of the Jack in the Box Creek, having all results below PFAS NEMP 2020 Drinking Water criterion.

©JBS&G Australia Pty Ltd

Sample Location/s	Target Area	Monitoring Undertaken	Discussion of Results and Screening Criteria Exceedances	Rationale for Observed Results/Changes
		confluence between Jack in the Box Creek and Wodonga Creek.		
Kiewa River Catchment – On-base				
SW340	Source Area 5	This sample location represents surface water drainage downgradient of the western portion of Source Area 5.	For the OMR sampling period, results have fluctuated slightly ranging from 0.91 to 5.86 µg/L for Sum of PFHxS+PFOS, however all are below historical results from the DSI (Golder 2018) of 6.80 µg/L during 2017.	The results are consistent with the Mass Flux Study (JBS&G 2024b), which identified that Source Area 5 contributed elevated PFAS concentrations to surface water.
SW346, SW349, SW355	Ornamental ponds along northern boundary of South Bandiana	The three sample locations are positioned in three of the main ornamental ponds located on the main drainage pathway between Source Area 5 and North Bandiana.	For the OMR sampling period, results from these locations have remained consistent, with Sum of PFHxS+PFOS ranging from 0.13 to 1.5 µg/L, which indicate all samples exceed PFAS NEMP 2020 Drinking Water criterion.	A distinct decrease can be seen in the data from the upstream pond (SW346) to the downstream ponds (SW349 and SW355), with almost an order of magnitude change. This is consistent with the findings of the Mass Flux Study (JBS&G 2024b) which identified decreasing surface water concentrations between Source Area 5 and the base boundary.
SW370, SW374, SW375	Main drainage channel of North Bandiana	The three sample locations are positioned along the main drainage channel of North Bandiana (which also collects surface water from South Bandiana), with SW375 representing conditions as water leaves the base.	For the OMR sampling period, results from these locations have remained consistent, with all samples having Sum of PFHxS+PFOS ranging from 0.07 to 0.3 µg/L, which indicate most samples exceed PFAS NEMP 2020 Drinking Water criterion.	Consistent with the findings of the Mass Flux Study (JBS&G 2024b), surface water concentrations have continued to decrease in this area compared to results from further upstream, as no Source Areas which contribute significant PFAS to surface water are located within North Bandiana.
SW379, SW380	Source Area 13	Both sample locations are positioned in surface water drainage locations surrounding Source Area 13.	The presence of surface water to be sampled at these locations has been a challenge during the OMR, with only around half of the planned samples being collected. This is consistent with the findings of the DSI Addendum (JBS&G 2024a) which identified sandy soils in the area which drain water quickly. Of the samples which were collected, results from these locations have remained relatively consistent and in line with historical results, with all Sum of PFHxS+PFOS results ranging from 0.11 to 0.58 µg/L, all of which exceed PFAS NEMP 2020 Drinking Water criterion.	The results are also consistent with the DSI Addendum (JBS&G 2024a) which identified the majority of the Source Area has been developed, resulting in widespread hardstand across the area which prevents significant flux of PFAS into the surface water pathway.
SW382	Sediment pond East Bandiana	SW382 is collected from a stormwater retention basis in the northwestern portion of the base.	For the OMR sampling period, analytical results were consistently below the LOR.	As per the Mass Flux Study (JBS&G 2024b), stormwater is not considered a key PFAS migration pathway for East Bandiana, with the pathway where SW382 is situated on (the western outlet) being the less impacted of the two East Bandiana surface water outlets (the eastern outlet receives stormwater from Source Area 13). This is also the likely reason why SW382 had sampling results which were below the LOR.
SW387, SW388	Eastern drainage pathway from East Bandiana	Both sample locations are positioned on the eastern drainage pathway between East Bandiana and the discharge point at the Kiewa River.	For the OMR sampling period, results from these locations have remained consistent, with Sum of PFHxS+PFOS results ranging from below LOR to 0.48 µg/L, resulting in the majority of samples exceeding PFAS NEMP 2020 Drinking Water criterion.	The results are considered consistent with the DSI Addendum (JBS&G 2024a) and Mass Flux Study (JBS&G 2024b) which did not find surface water to be a primary pathway for PFAS flux for East Bandiana. Furthermore, these documents identified a direct link between this surface water discharge point and surface water at Source Area 13 and it is noted that the concentrations between OMP sample locations from the two areas are comparable.
Kiewa River Catchment – Off-base				
SW409, SW412, SW462	Unnamed creek and associated oxbows – Northern and Central Pastoral areas	These sample locations are positioned along unnamed creek, in and down gradient of the residential development of Killara. The locations receive surface water flow which exists North Bandiana.	All sampling location results have been relatively consistent across the sampling rounds, with Sum of PFHxS+PFOS results ranging from 0.01 to 0.42 µg/L, resulting in just under half of the results just exceeding PFAS NEMP 2020 Drinking Water criterion, with the balance being just below.	Results are in line with historic data from the DSI (Golder 2018). Results from the off-base portion of unnamed creek are at similar concentrations or lower than the results which exist the base at North Bandiana.
SW403, SW405	Oxbows – Central Pastoral area	SW403 and SW405 are sampled from oxbow lakes within the Central Pastoral area.	All sampling location results have been relatively consistent across the sampling rounds, with Sum of PFHxS+PFOS results ranging from 0.04 to 0.95 µg/L, resulting in the majority of results just exceeding PFAS NEMP 2020 Drinking Water criterion.	It is considered likely that these oxbows receive some surface water flow from oxbows in the Southern Pastoral area, resulting in higher PFAS concentrations compared to the immediately adjacent Kiewa River or the neighbouring unnamed creek. Based on the data, it appears that flood water in the area (consistent with field observations) flushed both oxbows during October 2022, as an order of magnitude reduction in PFAS concentrations was identified in both oxbows for this sampling round, which slowly recovered in the following sampling events.
SW395, SW396, SW397, SW400,	Oxbows – Southern Pastoral area	These sampling locations are positioned across the Kiewa River floodplain in the Southern Pastoral area.	For the OMR sampling period, results from these locations have remained relatively consistent, with SW397 and SW487 exhibiting the highest concentrations, Sum of PFHxS+PFOS results ranging from 6.16 to 8.31 µg/L, while the balance of locations ranged from 0.06 to	The results obtained as part of the OMP, are consistent with the conceptual understanding of this area developed through the DSI Addendum (JBS&G 2024a) and the Mass Flux Study (JBS&G 2024b). These documents identified a relatively continuous sandy zone across East Bandiana with elevated PFAS results, which is considered likely to directly intercept the oxbow (SW487 and SW397 samples). This

©JBS&G Australia Pty Ltd

Sample Location/s	Target Area	Monitoring Undertaken	Discussion of Results and Screening Criteria Exceedances	Rationale for Observed Results/Changes
SW401, SW470, SW471, SW487			3.44 µg/L. It is appreciated that the oxbows that these samples are collected from are used for livestock watering, and that the results remain consistent with historic results and assumptions considered as part of the HHERA (Golder 2020). The risk through this exposure pathway therefore remains low and acceptable.	direct pathway is the cause of the PFAS at this oxbow being higher than in other oxbows in the floodplain. While other oxbows are likely to also receive groundwater discharge from this aquifer, the pathway connection is not as significant (i.e. the SW487/SW397 oxbow has been deepened) and the other oxbows are a greater distance from the base boundary, resulting in lower PFAS concentrations.
SW390	Kiewa River – upstream	This location represents background concentrations in the Kiewa River as it is positioned both upgradient of the base and the North East Region Water Corporation WTP.	All results from the OMR sampling period have consistently been below the LOR for this location.	This finding is consistent with the conceptual understanding of the area, with limited to no PFAS sources being known in the up-stream areas of the Kiewa River.
SW393	Middle Creek, close to Kiewa River confluence	SW393 is located within Middle Creek and represents potential contributions from the Middle Creek catchment.	All results from the OMR sampling period have consistently been below the LOR for this location.	This finding is consistent with the conceptual understanding of the area, with limited to no PFAS sources being known in the up-stream areas of Middle Creek.
SW398, SW404, SW416	Kiewa River – Management Area	These sample locations represent the Kiewa River along the length of the waterway which is covered by the Management Area.	All results from the OMR have consistently been below the LOR for all locations, with the exception of SW398 during the October 2022 event, which had a concentration of 0.08 µg/L for Sum of PFHxS+PFOS, which exceeds PFAS NEMP 2020 Drinking Water criterion.	Stantec did not provide comment for the concentration above the LOR in the Factual Report, however recent flooding in the area may have contributed (note the results from SW403 and SW405 above), although this was not identified in any of the other sampling results from the Kiewa River during this time.

©JBS&G Australia Pty Ltd

Surface water results obtained from the five OMP sampling rounds are consistent with expected results, based on the outcomes of the DSI Addendum (JSB&G 2024a) and the Mass Flux Study (JBS&G 2024b). Several minor anomalous results were identified during the OMR period, including SW326, SW332 and SW398, as discussed in detail in **Table 9.2** above. These sample locations should continue to be monitored to see if anomalous results or trends become apparent.

9.2.2 Analytical Results Based on Weather Conditions

As outlined in **Section 4.4** a number of deviations from the SAQP occurred that have resulted in nominated sample locations being missed due to insufficient surface water being present, due to a corresponding lack of rainfall, at the time of the sampling event. As a result, between 1 (sampling event E1) and up to 11 (sampling event E5) surface water locations could not be sampled. Rainfall data and information from the OMP do however confirm that the majority of the waterways located onsite are ephemeral, which is consistent with the findings of the Mass Flux Study (JBS&G 2024b). This trend occurs as the base is close to the top of the watershed, with little to no base flow passing through the base.

As identified previously in **Section 7.1**, above average rainfall occurred throughout the OMR period, with the rainfall experienced in 2022 being significantly higher compared to 2021 and 2023. However, due to the intermittent surface water data from the five OMP sampling events, no clear correlation or pattern was identified between increased rainfall and PFAS concentrations, with the exception of locations affected directly by flood water.

9.2.3 Analytical Results Based on Water Flow

As outlined in **Section 7.1**, the intention is to collect surface water samples during or immediately following rain events so that flowing water can be sampled in water courses, rather than stagnant water which may record higher PFAS concentrations owing to prolonged contact with PFAS containing soils/sediments. These conditions however are not always achievable owing to weather conditions or the quick draining nature of some portions of the base.

The flow rate has been provided on the surface water field data records sheets in the appendix of each Factual Report (see **Appendix C** through **Appendix G**). A review of the data presented identified that the flow in the majority of water ways outside the major creeks and rivers was low during events E1 through E3, and none (or stagnant) for E4 and E5, which is considered consistent with the rainfall data for the seven days prior to the event (see **Table 7.1**). A comparison of the analytical results between no flow and low flow sampling rounds did not indicate a clear correlation or pattern between flow rates and increased PFAS concentrations.

9.3 Sediment

Inclusion of sediment sampling locations within the OMP was to monitor PFAS concentrations in this media at key surface water flow locations to assist in the understanding of potential erosion, migration and deposition of materials from the base. The twelve sediment locations, which are shown in **Figure 5A** and **5B**, were divided into the following key surface water pathways:

- Jack in the Box Creek catchment (on and down gradient from South Bandiana) – SD463, SD323 and SD424;
- Kiewa River catchment (on and down gradient from South Bandiana and North Bandiana) – SD346, SD355, SD375 and SD412; and
- Kiewa River catchment (on and down gradient (i.e. Kiewa River floodplain) from East Bandiana) – SD382, SD400, SD397, SD396, SD395.

The results obtained as part of the OMP works with respect to the overall program including the CSM developed by the DSI Addendum (JBS&G 2024a) and Mass Flux Study (JBS&G 2024b) are discussed in **Table 9.3**. Further context is provided by discussion of the sediment results from the DSI (Golder 2018). Sediment

sampling locations from the top of the surface water catchment are presented first, followed by those further down the catchment.

Table 9.3: Interpretation of Sediment OMR Results

Sample Location/s	Monitoring Locations	Discussion of Results and Rationale for Observed Results/Changes
Jack in the Box Creek catchment (on and down gradient from South Bandiana)		
SD463	SD463 is located on what is considered a critical surface water pathway for PFAS leaving the base, receiving elevated surface water PFAS concentrations from Source Area 1 which generally exceed PFAS NEMP 2020 Recreational Water and Drinking Water criteria, as identified in the Mass Flux Study (JBS&G 2024b).	The sediment sample concentrations recorded at SD463 is considered to reflect this position of being immediately downgradient of Source Area 1, with the Sum of PFHxS+PFOS concentrations of 0.0088 mg/kg (May 2022) and 0.0051 mg/kg (May 2023) being relatively higher than other results from other areas both on and off-base which are located further from Source Areas. The results are consistent with that recorded during the DSI (Golder 2018) with a Sum of PFHxS+PFOS concentration of 0.0056 mg/kg.
SD323	SD323 is located on the base boundary for the drainage pathway which collects surface water from both Source Areas 6 and 7. While surface water concentrations are generally lower at this location compared to SD463, the Mass Flux Study (JBS&G 2024b) still highlights that it is a primary surface water pathway for PFAS.	The sediment sample concentrations recorded at SD323 is considered to reflect this position of receiving surface water flow from key impacted Source Areas, with the Sum of PFHxS+PFOS concentrations of 0.0173 mg/kg (May 2022) and 0.0137 mg/kg (May 2023) being relatively higher than other results from other areas both on and off-base which are located in less critical pathways. The results are slightly lower than that recorded during the DSI (Golder 2018) with a Sum of PFHxS+PFOS concentration of 0.0342 mg/kg.
SD424	SD424 is located further downstream than SD463, but before the confluence with surface water from Source Area 1 (represented by SD323).	The sediment sample concentrations recorded at SD424 were slightly lower than those recorded at SD463, with the Sum of PFHxS+PFOS concentrations of 0.0041 mg/kg (May 2022) and 0.0035 mg/kg (May 2023), which makes sense given its greater distance from Source Areas. It is also noted that SD424 is collected from a concrete culvert, which would likely increase the flow of water and enable sediment to be scoured further downstream rather than accumulating. The results are lower than that recorded during the DSI (Golder 2018) when a Sum of PFHxS+PFOS concentration of 0.0596 mg/kg was obtained.
Kiewa River catchment (on and down gradient from South Bandiana and North Bandiana)		
SD346	SD346 is located immediately downgradient from Source Area 5, another area that the Mass Flux Study (JBS&G 2024b) highlighted as generating elevated surface water PFAS concentrations which generally exceed PFAS NEMP 2020 Recreational Water and Drinking Water criteria.	The sediment sample concentrations recorded at SD463 is considered to reflect this position of being immediately downgradient of Source Area 5, with the Sum of PFHxS+PFOS concentrations of 0.0041 mg/kg (May 2022) and 0.0114 mg/kg (May 2023) being relatively higher than other results from other areas both on and off-base which are located further from Source Areas. The results are consistent with that recorded during the DSI (Golder 2018) with a Sum of PFHxS+PFOS concentration of 0.0161 mg/kg.
SD355	SD355 is located at the end of three ornamental ponds, compared to location SD346 above, which is at the start of the ponds.	The sediment sample concentrations recorded at SD355 were 0.001 mg/kg (May 2022) and 0.0011 mg/kg (May 2023) for Sum of PFHxS+PFOS. It would appear that both surface water and sediment PFAS concentrations are reduced by the presence of the ornamental ponds within the drainage pathway. The results are lower than that recorded during the DSI (Golder 2018) when a Sum of PFHxS+PFOS concentration of 0.0128 mg/kg was obtained.
SD375	SD375 is located at the point where surface water leaves the North Bandiana base.	The sediment sample concentrations recorded at SD375 were 0.0044 mg/kg (May 2022) and 0.0032 mg/kg (May 2023) for Sum of PFHxS+PFOS. While North Bandiana does not have highly impacted Source Areas which could greatly contribute to PFAS surface water concentrations, it does receive surface water from the eastern portion of South Bandiana, which could contribute to slightly higher concentrations than SD355. The results are lower than that recorded during the DSI (Golder 2018) when a Sum of PFHxS+PFOS concentration of 0.0118 mg/kg was obtained.
SD412	SD412 is located close to the end of unnamed creek, east of the residential development of Killara.	The sediment sample concentrations recorded at SD412 were 0.0014 mg/kg (May 2022) and 0.002 mg/kg (May 2023) for Sum of PFHxS+PFOS. As there are no PFAS sources between SD412 and SD375 and the distance between the two sample locations is approximately 1.2 km, it is considered appropriate that the PFAS results are approximately half that of SD375. The results are lower than that recorded during the DSI (Golder 2018) when a Sum of PFHxS+PFOS concentration of 0.0038 mg/kg was obtained.
Kiewa River catchment (on and down gradient (i.e. Kiewa River floodplain) from East Bandiana)		
SD382	SD382 is collected from a stormwater retention basis in the northwestern portion of the base.	Stormwater is not considered a key PFAS migration pathway for East Bandiana, with the pathway what SD382 is situated on (the western outlet) being the lesser impacted pathway of the two East Bandiana surface water outlets (the eastern outlet receives stormwater from Source Area 13). This is the likely reason why SD382 had below LOR concentrations during both May 2022 and May 2023. The results are lower than that recorded during the DSI (Golder 2018) when a Sum of PFHxS+PFOS concentration of 0.0011 mg/kg was obtained.
SD397	SD397 is located in the oxbow that is understood to be in direct connection to the Shepparton and Coonambidgal Fluvium intermediate aquifer and as such generally has the highest PFAS surface water concentration of all of Kiewa River floodplain oxbows.	It is this PFAS surface water presence and the static nature of the water body, that has likely resulted in the Sum of PFHxS+PFOS concentrations of 0.0442 mg/kg (May 2022) and 0.0861 mg/kg (May 2023) being relatively higher than other results from other areas both on and off-base which are located further from Source Areas. The results are consistent with that recorded during the DSI (Golder 2018) with a Sum of PFHxS+PFOS concentration of 0.0527 mg/kg.
SD395, SD396 and SD400	SD395, SD396 and SD400 are located in other oxbows across the Kiewa River floodplain.	These oxbows are not likely connected to groundwater (or at least to the same extent as the oxbow from which SW397 is sampled), although the oxbow which SD400 is collected from receives stormwater from the northern portion of East Bandiana, which has very low levels of PFAS. Concentrations in SD395, SD396 and SD400 are all lower than that seen in SD397, with results as follows: • SD395: Sum of PFHxS+PFOS concentrations of 0.002 mg/kg (May 2023), not sampled in May 2022, and 0.0016 mg/kg and 0.0033 mg/kg during the DSI (Golder 2018) and HHERA (Golder 2020) respectively; • SD396: Sum of PFHxS+PFOS concentrations of 0.0373 mg/kg (May 2022), 0.0223 mg/kg (May 2023), 0.0162 mg/kg during the DSI (Golder 2018) and 0.0545 mg/kg during the HHERA (Golder 2020); and • SD400: Sum of PFHxS+PFOS concentrations of 0.0059-0.0144 mg/kg (May 2022), 0.0193 mg/kg (May 2023), 0.0031 mg/kg during the DSI (Golder 2018) and 0.0092 mg/kg during the HHERA (Golder 2020).

©JBS&G Australia Pty Ltd

Sediment PFAS concentrations within the surface water drainage pathways are representative of their position relative to Source Areas, with higher concentrations identified in areas immediately adjacent Source Areas, or in areas receiving elevated surface water concentrations from Source Areas.

Two sampling rounds for sediment have been included in this OMR from the OMP program and PFAS results between the two rounds are similar. Results from the DSI (Golder 2018) and those available for the HHERA (Golder 2020) are also provided, which were generally slightly higher than those obtained during the OMP program. The years of the DSI and HHERA were years of below average rainfall (with 610.9 mm for 2017 and 338.1 mm for 2019), which indicates there may be some correlation between rainfall and sediment concentrations (i.e. lower rainfalls produce slightly higher PFAS in sediment concentrations).

Similar to surface water, sediment PFAS concentrations tend to decrease with the distance away from the Source Area.

Given that the relationship between PFAS concentrations in media and their position relative to Source Area is better understood and defined by surface water (compared to sediment), and given the significant increase in knowledge in regard to PFAS pathway migration from the base, the continued monitoring of sediment is not considered to bring significant value to the OMP.

10. Potential Implications of OMR for PMAP

The following section provides a discussion of potential implications of the OMP results from 2021 through 2023 on the overall PMAP program, including refinement to the CSM and the risk profile.

10.1 CSM

The current CSM, as detailed in **Section 3,** has been developed based on multiple investigations, with the latest refinement being undertaken as part of the DSI Addendum (JSB&G 2024a) and Mass Flux Study (JBS&G 2024b). The CSM takes into consideration sources, pathways and receptors, each of which have been discussed in the following sections.

10.1.1 Source Areas

The results of the groundwater, surface water and sediment monitoring undertaken and summarised in this OMR did not identify additional Source Areas as listed in **Section 3**.

As detailed throughout this report, the results from the OMR have corroborated the findings of the Mass Flux Study (JBS&G 2024a). This indicates the need for further soil characterisation works within both Source Area 1 and Source Area 7, to provide additional data to inform current groundwater conditions and surface water runoff results.

While there is insufficient OMP data currently available with which to undertake statistical analysis, it was identified that several areas of the base have shown increased PFAS concentrations in both surface water and groundwater, however the changes have not been shown to be material and are generally not greater than an order of magnitude over the five sampling events. It is considered that the above average rainfall experienced in 2022 may have contributed to the trends (particularly for groundwater). With the exception of two locations where PFAS increases have been attributed to the direct influence of identified Source Areas, further monitoring to obtain a statistically valid dataset is required prior to considering the need for any further investigation or additional management actions other than those outlined in the PMAP (Defence 2020).

10.1.2 Pathways

Further investigation of PFAS migration pathways was a primary objective of both the DSI Addendum (JBS&G 2024a) and Mass Flux Study (JBS&G 2024b). As identified throughout this document, these investigations demonstrated that the primary PFAS migrations pathways for North and South Bandiana is surface water, while for East Bandiana it is groundwater. The OMP results discussed as part of this OMR have assisted in confirming the pathways identified under these two assessments. Collectively this corroborates the pathways identified in the updated CSM outlined in **Section 3.2**.

10.1.3 Receptors

No new receptors have been identified as part of preparation of this OMR.

10.1.4 CSM Revision

Based on the above review, it is not considered necessary to update the current CSM. Information provided in **Section 3** is considered accurate and current.

10.2 Risk Profile

With the exception of several surface water and groundwater locations, including MW307 and MW321, the OMP analytical results discussed as part of this OMR were generally within ranges identified and considered in previous PFAS investigations undertaken at the base since 2018. Where PFAS increases have been identified during an OMP event, a review has been completed of the source-pathway-receptor linkage to identify if there has been a material change in risk to on and off-base receptors. No material changes have been identified.

Based on the OMP results and no significant changes to the on-base and surrounding land uses, the risk profile of the identified contamination remains unchanged. It is noted that the Environment Protection Authority Victoria (EPA) has advised against consumption of Carp caught in the Kiewa River between Bakers Land and the Cudgewa-Wodonga Rail Trail, inclusive of the flood plain area bound by Bakers Lane and the Murray Valley Highway. A review of risk will be completed in future OMRs to reflect the results of a Water Use Survey program that Defence are undertaking in targeted area of the Management Area.

In light of the DSI Addendum (JBS&G 2024a), the Mass Flux Study (JBS&G 2024b) and results from this OMR, further monitoring should be completed to assess groundwater immediately off-base to the north of East Bandiana and to the east of North Bandiana, as consistent with the recommendations made throughout this report, and summarised in **Section 11**. Otherwise, based on the results of the OMP monitoring outlined and analysed in this OMR, it is considered that the existing monitoring network is sufficient to continue monitoring of PFAS identified within Source Areas and migration pathways, although it is understood that Defence is currently in the process of reviewing the BMA PMAP and associated OMP, into which the recommendations from this OMR will be incorporated.

11. Conclusions

JBS&G completed a review of the five OMP sampling events conducted by Stantec between 2021 and 2023. Results from these events have been assessed against adopted criteria and reviewed in the context of existing investigations and historical data in order to identify and evaluate:

- Spatial and temporal (including seasonal) variability of PFAS in the environment;
- Changes to PFAS sources, transport pathways and/or receptors for the BMA and wider Management Area;
- Whether risks to human and ecological receptors require review; and
- Whether the identified changes in PFAS concentrations during the OMP trigger an action and/or review.

Based on the review completed, it has been identified that the overall objectives of the OMP have been achieved, with the minor deviations from the SAQP not being identified as material to the program outcomes. The conclusions reached, in accordance with the limitations provided in **Section 12**, have been provided below.

11.1 Groundwater

Groundwater levels were influenced by the above average rainfall experienced during the OMR reporting period, with levels at some wells 1.5 m higher during the 2022 monitoring events compared to 2021 and 2023. This water level change may have contributed to some minor increasing PFAS concentration trends (i.e. generally less than an order of magnitude) in some wells and additional monitoring is required to establish trends during average conditions to determine if further action is warranted.

Groundwater flow directions across the BMA are consistent with the conceptual understanding of groundwater movement from topographically high to topographically low areas. The Shepparton Colluvium shallow aquifer (South Bandiana and North Bandiana) flows in a west and north westerly direction towards Jack in the Box Creek, while the Shepparton and Coonambidgal Fluvium aquifer at East Bandiana flows in a north easterly direction towards the Kiewa River.

The groundwater results from the five OMP sampling rounds are relatively stable and consistent with the outcomes of historical and more recent investigations. PFAS concentrations within the Shepparton Colluvium shallow aquifer, in North and South Bandiana are generally stable with elevated concentrations and detections restricted to the portion of the base in and immediately surrounding the previously identified Source Areas. PFAS concentrations within the Shepparton and Coonambidgal Fluvium aquifers at East Bandiana are also relatively stable, although an PFAS plume is present from Source Area 13 across to the north eastern base boundary, which is consistent with the findings of historical and more recent investigations.

The OMR data, in addition to other investigations on the base, have identified ongoing elevated PFAS concentrations in MW307 in Source Area 1 on South Bandiana and a PFAS concentration increase between 2022 and 2023 in MW321 in Source Area 7, also on South Bandiana. Both areas are currently subject to further soil characterisation works which will assist in further understanding the OMP results.

11.2 Surface Water

The surface water results obtained from the five OMP sampling rounds indicate relatively consistent concentrations and align with the identified Source Areas and their respective pathways to off-base areas. This includes elevated surface water PFAS concentrations associated with select Source Areas (1, 5, 6 and 7) across South Bandiana being transported into Jack in the Box Creek and Kiewa River off-base catchments. The results also confirm that surface water is not the primary migration pathway for East Bandiana, with surface water results in the off-base Kiewa River floodplain considered to primarily be the result of groundwater migration (as per the findings of recent PFAS investigations).

Several anomalous results were identified during the OMR period, including SW326, SW332 and SW398. These sample locations should continue to be monitored to determine the significance of the anomalous results.

Based on the surface water data from the five OMP sampling events, no clear correlation or pattern was identified between above average rainfall and PFAS concentrations.

11.3 Sediment

Sediment PFAS concentrations within surface water drainage pathways are representative of their location relative to Source Areas, with higher concentrations identified in areas immediately adjacent Source Areas/in areas where elevated surface water concentrations are present. Sediment PFAS concentrations tend to decrease with distance from a Source Area.

Given that the relationship between PFAS concentrations in media and their position relative to Source Area is better understood and defined by surface water (compared to sediment), and given the significant increase in knowledge in regard to PFAS pathway migration from the base, the continued monitoring of sediment is not considered to bring significant value to the OMP.

11.4 CSM and Risk Profile Update

The OMP results did not identify any additional Source Areas which had not been previously assessed and no additional transport/exposure pathways or changes to existing pathways have been identified.

The OMP analytical results discussed as part of this OMR were generally within ranges identified and considered in previous investigation reports. Where PFAS increases have been identified during an OMP event, a review has been completed of the source-receptor pathway to identify if there has been a material change in risk to on and off-base receptors. No material changes have been identified.

11.5 Program Triggers or Actions

Based on the assessment completed as part of this OMR it was concluded that the objectives of the OMP have been achieved by the program. The assessment has identified that PFAS concentrations during the 2021 to 2023 period were generally consistent with previous investigation and historic data and as a result there has been no material change in risk to on and off-base receptors.

While the existing monitoring network is sufficient to continue monitoring of PFAS identified within Source Areas and migration pathways, there are several recommended alterations to the OMP monitoring program, including the following:

- Further monitoring of groundwater is recommended immediately off-base to the north of East Bandiana to delineate the known East Bandiana PFAS plume to the oxbow lake closest to the base boundary;
- Owing to the proximity of Source Area 1 to the base boundary and increases in MW307, it is recommended that additional samples be collected to ensure that the monitoring of the potential migration of the PFAS plume;
- The addition of wells in North Bandiana to the program to ensure adequate data is available to calculate groundwater flow contours in this portion of the base, and to delineate elevated groundwater PFAS concentrations recently detected;
- Off-base monitoring through the provision of a new well (MW447) to the east of North Bandiana to characterise the PFAS plume prior to potentially entering the Killara residential development; and
- Discontinuation of sediment sampling as part of the OMP as there are no obvious trends in the data and they do not present a risk to people off-base.

Defence has planned remedial works commencing in 2025 that will consist of remediation of Source Areas across Southern and Eastern Bandiana as well as groundwater remedial works in East Bandiana. These works will in time contribute to reductions of PFAS concentrations in the Management Area however given the size of the area impacted, this will be a slow process. In the meantime, monitoring will continue and advice will be provided to the community to ensure risks presented by PFAS are managed

12. Limitations

This report has been prepared for use by the client who has commissioned the works in accordance with the project brief only and has been based in part on information obtained from the client and other parties. The report has been prepared specifically for the client for the purposes of the commission and no warranties, express or implied, are offered to any third parties and no liability will be accepted for use or interpretation of this report by any third party.

The advice herein relates only to this project and all results conclusions and recommendations made should be reviewed by a competent person with experience in environmental investigations, before being used for any other purpose. This report should not be amended in any way without prior approval by JBS&G, or reproduced other than in full including all attachments as originally provided to the client by JBS&G.

Sampling and chemical analysis of environmental media is based on appropriate guidance documents made and approved by the relevant regulatory authorities. Conclusions arising from the review and assessment of environmental data are based on the sampling and analysis considered appropriate based on the regulatory requirements or agreed scope of work.

Limited sampling and laboratory analyses were undertaken as part of the investigations undertaken, as described herein. Conditions between sampling locations and media may vary and this should be considered when extrapolating between sampling points. Chemical analytes are based on the information detailed in the site history. Further chemicals or categories of chemicals may exist at the site, which were not identified in the site history and which may not be expected at the site.

Changes to the conditions may occur subsequent to the investigations described herein, through natural processes or through the intentional or accidental addition of contaminants. The conclusions and recommendations reached in this report are based on the information obtained at the time of the investigations.

This report does not provide a complete assessment of the environmental status of the site and it is limited to the scope defined herein. Should information become available regarding conditions at the site including previously unknown sources of contamination, JBS&G reserves the right to review the report in the context of the additional information.

1 Introduction

Cardno, now Stantec (Cardno), have been engaged by the Australian Department of Defence ('Defence') to prepare a Sampling and Analysis Quality Plan (SAQP) as part of the Ongoing Monitoring Plan (OMP), the purpose of which is to monitor trends in the extent and concentrations of per- and poly-fluoroalkyl substances (PFAS) identified on and around Bandiana Military Area (BMA) (the "Site"), Victoria.

The OMP SAQP applies to BMA and surrounding areas that make up the "Management Area", outlined in Figure 1, Appendix A and defined in Section 2.1.1.

The Site is located on Commonwealth Land and is regulated under Commonwealth environmental legislation.

The OMP outlines the rationale and scope for monitoring the concentrations and extent of PFAS in groundwater, surface water and sediment originating from the Site for an initial 2-year monitoring period (initial implementation period). The initial implementation period consists of biannual and annual sampling events. Findings from the monitoring over the 2-year initial implementation period will be used to assess any changes to the nature and extent of PFAS impact within the environment, where there is an identified potentially elevated risk to a receptor, or a potential future risk to a receptor.

1.1 Scope & Objectives

The objective of the SAQP is to present the specific monitoring locations, sampling methodologies and quality assurance / quality control (QA/QC) measures for the monitoring of the concentrations and extent of PFAS in groundwater, surface water and sediment at and around the Site under the OMP. These findings will inform risk management decisions by Defence and the Victorian Government to protect human health and the environment.

The objectives of the ongoing monitoring program as set out in the OMP are to:

- Implement a program of surface water, groundwater and sediment monitoring to continue to assess changes in risk from PFAS within the environment, focusing on where there is an identified potential risk requiring management under the PFAS Management Area Plan (PMAP); and
- Assess the seasonal effects of PFAS concentrations in surface water, groundwater and sediment, including, during or immediately following extreme or high rainfall events.

The scope of the monitoring specified in the OMP includes:

- Evaluating the nature and extent (spatial and temporal) of PFAS impacts in groundwater, surface water and sediment pathways associated with Site sources of PFAS derived from legacy AFFF;
- Monitoring the migration of PFAS in groundwater and surface water from the Site;
- Providing confirmation of the current understanding of risk; and
- Providing supporting data for assessment of management actions, where relevant.

These objectives fulfil the recommendations outlined in the PFAS Management Area Plan (PMAP) (Golder, 2020b) to provide supporting data to inform the ongoing management requirements for impacted media on- and Off-Site contributing to a potentially elevated risk to receptors.

1.2 Previous Reports

The following key reports prepared in relation to the BMA PFAS Investigation have been used as a basis to develop this SAQP:

- Golder (2018), PFAS Detailed Site Investigation (DSI), Bandiana Military Area, September 2018.
- Golder (2020a), Human Health and Ecological Risk Assessment (HHERA), Bandiana Military Area, November 2020.
- Golder (2020b), Bandiana Military Area, PFAS Management Area Plan (PMAP), November 2020.
- Golder (2020c), Bandiana Military Area, PFAS Ongoing Monitoring Plan, November 2020.

> GHD (2016), Defence per- and poly-fluoroalkyl Substances (PFAS), Environmental Management Preliminary Sampling Program, Albury Wodonga Military Area (Bandiana), September 2016.

1.3 Responsible Parties

Responsible parties and responsibilities associated with the implementation of the OMP are detailed in Table 1-1.

Table 1-1 Responsible Parties

Role	Responsibilities
Department of Defence – PFAS Investigation and Management Branch	▪ Implement this OMP. ▪ Engage suitably qualified environmental consultants/contractors to carry out the works specified in the OMP.
Bandiana Military Area – Base Manager and Environment and Sustainability Manager	▪ Review and approve all necessary permits required for implementation of the works outlined in the OMP.
Environmental Consultant	▪ Obtain necessary permits from BMA to implement the works outlined in the OMP. ▪ Liaise with local council or water authority to arrange sampling of Off-Site waterways, as required. ▪ Undertake the monitoring activities outlined in this SAQP. ▪ Produce a factual report that summarises the data and findings of each monitoring event and is consistent with the requirements of this SAQP. ▪ Produce an ongoing monitoring report (OMR) including recommendations for any potential changes in the location and frequency of sampling which may be incorporated in the revision of the OMP. ▪ Upload analytical data from each monitoring event to the relevant Defence ESdat database.
Department of Defence and Environmental Consultant (lead)	▪ Liaise with Off-Site private property owners/relevant authorities to arrange private property access to conduct sampling.
PMAP Lead Consultant	▪ Implement PMAP recommendations and undertake PMAP review. Undertakes OMP review.

1.4 Relevant Guidelines

This SAQP has been prepared in general accordance with the current 'industry standards' for a site investigation for the purpose, objectives and scope identified in this report. These standards are set out in:

> Australian Standard (2005), AS 4482.1-2005, Guide to the Investigation and Sampling of Sites With Potentially Contaminated Soils, Part 1 - Non-volatile and Semi-Volatile Compounds (withdrawn as pending revision, referred to for 'state of knowledge').

> Department of Defence (2019), Pollution Prevention Management Manual – Annex 1L: Pollution Prevention Guidance – Routine Water Quality Monitoring.

> Department of Defence (2021b), Contamination Management Manual (DCMM), Annex L – Data Management, August 2019, Amended June 2021.

> Department of Defence, Department of Energy (2018), Quality System Manual Schedule B15 USEPA DQO Process.

> Environment Protection Authority (EPA) Victoria (2022), Groundwater Sampling Guidelines, Publication 669.1, February 2022.

> EPA Victoria (2009), Sampling and Analysis of Waters, Wastewaters, Soils and Wastes, Publication 701, June 2009.

> EPA Victoria (2020), Interim Position Statement on PFAS, Publication 1669.4, October 2020.

> Heads of Environmental Protection Authority's Australia and New Zealand (HEPA) (2020), PFAS National Environmental Management Plan (NEMP) Version 2.0, January 2020.

- National Environment Protection Council (NEPC) (2013), National Environmental Protection (Assessment of Site Contamination) Measure (1999, as amended 2013) (ASC NEPM).
- National Health and Medical Research Council (NHMRC) (2019), Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water, August 2019.
- United States Environment Protection Authority (USEPA) (2006), Guidance for the Data Quality Objectives Process (EPA QA/G-4).
- USEPA (2002), Guidance on Environmental Data Verification and Data Validation (EPA QA/G-8).

1.5 Standards of Assessment and Limitations

This SAQP has been prepared in general accordance with the current industry standards for an assessment of this type for the purpose, objectives and scope identified in this report.

The scope presented in this SAQP report are derived only from available desk-based information and site inspection undertaken. This SAQP is not any of the following:

- An Environmental Audit Report as defined under the Environment Protection Act 2017.
- A Geotechnical Assessment.
- A Detailed Site Investigation.
- A Detailed Hydrogeological Assessment.
- A Remediation Action Plan (RAP) report.
- A Site Management Plan (SMP).

2 Site Setting

2.1 Site Description

BMA is located approximately 250km north-east of Melbourne, adjacent to the New South Wales (NSW) – Victoria border town of Wodonga, Victoria and covers an area of 650 hectares (ha). The Site is situated approximately 3km from Wodonga town centre. The BMA comprises the following bases:

- Gaza Ridge Barracks (comprising and referred to in this report as North Bandiana and South Bandiana); and
- Wadsworth Barracks (comprising and referred to in this report as East Bandiana).

BMA is used by Defence for administration, accommodation, training and warehousing / logistics. Other operations related to storage and maintenance of vehicles also occur at the Site.

The other infrastructure and supporting services on each portion of the BMA include the following:

South Bandiana

- Several residential areas for Defence personnel.
- Victorian State Government Primary School (Bandiana Primary School).
- Sheep grazing along the base of Bears Hill.
- Base Fire Services (former training ground).
- Petroleum facilities.

North Bandiana

- Several residential areas for Defence personnel.
- Community facility (Bandiana Neighbourhood House), which is registered child care provider, kinder and playground.
- Sheep grazing to the south-east of the unnamed creek.
- Warehouses for storage of equipment.

East Bandiana

- Current Fire Station.
- Football field.

2.1.1 Management Area Description

The OMP includes sampling and analysis not only from the Site, but also from Off-Site locations situated on public and private land. The Site and these surrounding areas which collectively encompass the network of OMP monitoring locations, are referred to as the "Management Area".

The "On-Site Monitoring Area" is defined as BMA and is comprised of three individual properties identified as North Bandiana (Gaza Ridge Barracks), South Bandiana (Gaza Ridge Barracks) and East Bandiana (Wadsworth Barracks).

The "Off-Site Monitoring Area" is defined as comprising Jack in the Box Creek to the north-west of South Bandiana to its confluence with Wodonga Creek, an unnamed creek to the east of North Bandiana to its confluence with the Kiewa River, and the Kiewa River and western Kiewa River floodplain from Middle Creek in the south to north of the unnamed creek.

"The Management Area" is defined as comprising the On-Site Monitoring Area and the Off-Site Monitoring Area.

2.1.2 Site Definition and Planning

For the purposes of this SAQP report, "the Site" is defined as comprising BMA. A detailed description of the Site is provided in the PMAP (Golder, 2020b). The site location is presented on Figure 1, Appendix A.

Key Site identification details are presented in Table 2-1.

Table 2-1 Site Identification Details

Details	Description
Site Address	Bandiana Military Area, VIC, 3694
Land Description	Bandiana Military Area
Owner	Department of Defence
Title Details[1]	North Bandiana: • Lot 2 PS437772 South Bandiana: • Lot 1 TP849698 • Lot 2 TP849698 • Lot 2 PS420756 • Lot 3 PS420756 East Bandiana: • Lot 1 PS400773 • Lot 1 TP849660
Planning Zone / Land use	Commonwealth Land (CA)
Local Government Authority (LGA)	City of Wodonga

2.1.3 Surrounding Land Uses and Zoning

The adjacent land surrounding the Site is a mix of:

- General Residential (GRZ1).
- Public Park and Recreation (PPRZ).
- Rural Conservation Zone (RCZ).
- Industrial Zone (IZ1) and,

> Public Conservation and Resource Zone (PCRZ).

The immediate surrounding land uses are outlined in Table 2-2.

Table 2-2 Current and Previous Surrounding Land Uses

Area	Direction	Historic Land Use (Golder, 2018)	Current Land Use (Golder, 2020c)
North Bandiana	**North**	Historical aerial imagery shows the Huon Hill area as vacant land.	Huon Hill, which is currently used for grazing and as a recreation space (walking and picnicking).
	West	Aerial imagery shows the land largely undeveloped with only one residential property visible from 1969-2003.	A residential development is located to the west (low density residential development) followed by the town of Wodonga.
	East	Aerial imagery shows the land largely undeveloped followed by the Kiewa River, floodplain and unnamed creek.	A residential development is located to the east (low density residential area) followed by the Kiewa River floodplain and Kiewa River. The unnamed creek flows east through the residential development.
	South	Aerial imagery shows South Bandiana to the south-west, the Wodonga stockyards and vacant land followed by Upper Middle Creek directly south.	South Bandiana is located to the south across Anzac parade and the Murray valley Highway. An industrial facility and the former Wodonga stockyards are located south of the northern portion of North Bandiana. Upper Middle Creek is located beyond the industrial facility and the former stockyards.
East Bandiana	**North**	Residential properties are located to the north as early as 1969, with the Kiewa River further north.	A residential development is located to the north, with the Kiewa River further to the north.
	West	Undeveloped land is located west across Whytes Road in aerials from 1969-1975. Historical aerials from 1987 onwards show the Wodonga Stockyard.	The former Wodonga Stockyard is located to the west across Whytes Road.
	East	Residential properties are located to the north-east as early as 1969, as well as the Kiewa River floodplain. The Kiewa River travels south to north, east of East Bandiana.	The residential suburb of Killara is located to the east, as well as pastoral grazing lands within the Kiewa River floodplain. The Kiewa River is located to the east, and continues to the north.
	South	Middle Creek flows west to east along the southern boundary in aerial imagery from as early as 1969.	Middle Creek flows in a west to east direction along the southern boundary of the Site, with Baranduda Water Treatment Plant located beyond Middle Creek.
South Bandiana	**North**	Aerial imagery shows Anzac Parade followed by residential properties and Huon Hill.	North Bandiana and a residential development are located to the north across Anzac Parade. A small area of commercial properties are also located to the north.
	West	Aerial imagery shows the land largely undeveloped from 1969-2003. Jack in the Box Creek flows to the north-western boundary towards Wodonga Creek	Residential development is located to the west, with the Jack Perry Reserve (recreational reserve) adjacent to the north-west boundary of BMA. Jack in the Box Creek flows to the north-western boundary towards Wodonga Creek.
	East	Aerial imagery shows the land largely undeveloped. Middle Creek flows south to east across the Kiewa Highway.	An industrial facility is located to the east, across the Kiewa Valley Highway, with rural grazing properties located to the south across Tooles Road.
	South	Historical aerial imagery shows the area south of South Bandiana as vacant land.	A rural grazing property is located adjacent to the southern boundary. A mix of rural grazing properties and new residential

Area	Direction	Historic Land Use (Golder, 2018)	Current Land Use (Golder, 2020c)
			developments are further south beyond Bears Hill.

2.1.4 Environmental Setting

Key details defining the site are summarised in Table 2-3. See Figure 1, Appendix A for key features.

Table 2-3 Key Site Details

Setting	Description
Climate	Climate indicators have been recorded at nearby Albury Airport Bureau station (072146) since 1983. Mean maximum temperatures range from 13.0°C in July to 31.9°C in January. Mean annual rainfall at this station since 1983 is 713.2mm, with rain falling more from June through October. The minimum mean monthly rainfall occurs in February with 43.0 mm, and the maximum in July with 77.7 mm. The prevailing wind direction in the morning (9am) is from the east while in the afternoon (3pm) the prevailing winds are from the south-east and, to a lesser extent, the west. The regional wind direction may be affected by the surrounding topographic features such as Bears Hill[1].
Topography	The Site is located in the Upper Murray landscape where low lying and relatively flat river and creeks floodplains are present. The dominant topographic features in the area comprise Huon Hill in the north-east and Bears Hill in the south-west, which rise 400m above the Australian Height Datum (mAHD) and 350 mAHD, respectively. The BMA is largely located in between the two hills at an elevation ranging from 180 mAHD and 200 mAHD. There is an approximate north to south topographic divide that runs through the BMA which divides the BMA into two catchments. West of the divide, the surface slopes to the north-west towards the Murray River and Wodonga Creek via Jack in the Box Creek. East of the divide, the surface slopes to the east and north-east towards the Kiewa River.
Geology	**Regional Geology:** As outlined in the DSI (Golder, 2018) and OMP (Golder, 2020c), the Site is underlain by three (3) main geological units, comprising: ▪ The Omeo-Metamorphic Complex (OMC) forms the basement rock for the investigation area. It has been formed by fine sediments and muds transported during the Ordovician period from an ancient continental zone. Tectonic activity created the intrusions of magmatic rock, mainly granite. Clays and muds formed schist, while the granite transformed into gneiss. The hills of the investigation area (Bears Hill (gneiss) and Huon Hill (schist) are the remnants of this period. ▪ The Shepparton Formation resulted from deposition and erosion of sand, silt and clay associated with the ancient Murray River system during the Tertiary period. Erosion caused by this ancient river system resulted in the carving of a deep paleovalley within the OCM. Further erosion of the hills resulted in the further accumulation of sediments at the base of the hills, which is called the Shepparton Colluvium. This unit is inferred to be mainly distributed along the central part of the investigation area between Bears Hill and Huon Hill. The Shepparton Fluvium, which is inferred to be mainly distributed in the north-west and south-east portions of the investigation area, is the result of the deposition of alluvial sediments from the ancient Murray River system within the paleovalley. ▪ The Coonambigdal Formation also resulted from river sediment deposition and erosion, which was formed during the Quaternary period. The Coonambigdal Colluvium resulted from the recent erosion of the hills, which is reflected along the foothills of Huon and Bears Hills. Coonambigdal Fluvium is the result of sediment deposition, distributed in the lower lying zones of the investigation area, along the existing creeks and rivers surrounding the BMA. **Site Specific Geology:** South Bandiana: The sub-surface conditions encountered across South Bandiana are generally consistent with the unconsolidated hill-wash deposit (Quaternary and Tertiary Shepparton Colluvium comprising sands, silts, clays and gravels) inferred by the Geological Map Sheet (1979). These are also encountered in the upper portion of Jack in the Box Creek. The Shepparton Colluvium was generally observed to comprise fine grained red brown sediments (clays and silts) with some interbedded sands and gravels. OMC basement rock, in the form of granite, was identified towards the base of Bears Hill in South Bandiana. The depth to basement rock generally decreased towards Bears Hill as did the thickness of the overlying Shepparton Colluvium and Coonambigdal Colluvium (Golder, 2018). North Bandiana: The 1:50,000 Albury Geological Map Sheet (1979) indicates that North Bandiana is situated across the Quaternary and Tertiary Shepparton Colluvium, and the younger Shepparton Fluvium.

Setting	Description
	The geological profiles across the northern and western portion generally comprised fine grained red brown sediments (clays and silts) with some interbedded sands representative of the Shepparton Colluvium. An increase in coarser grained brown, orange brown and grey brown soils (sands and gravels) were observed along the unnamed creek in the southern portion of North Bandiana. These soils are representative of the Shepparton Fluvium (Golder, 2018). East Bandiana: East Bandiana is comprised of various combinations of clays, silts and sands, which is reflective of the nature of the depositional environment. The upper 3-5 m of the profile tended to be dominated by brown sandy soils, underlain by brown clay soils. These soils are representative of the Shepparton Fluvium. The soil encountered along the Kiewa River were generally coarser, predominately comprising sands and gravels, and as such were considered representative of the Coonambigdal Fluvium (Golder, 2018).
Acid Sulphate Soil	A review of the Acid Sulphate Soils (ASS) risk mapping, available on the Soil Health online database[2], indicates that South Bandiana and the western part of North Bandiana are classified as having an extremely low probability of ASS occurrence, whereas East Bandiana is classified as low probability of ASS occurrence.
Hydrology	Several surface water bodies including Jack in the Box Creek, Middle Creek, an unnamed creek and the Kiewa River conform the two (2) catchments at the Site as follows: ▪ **Jack in the Box Creek Catchment (west of the topographic divide):** this catchment is located to the western portion of South Bandiana, which drains towards Wodonga Creek (3.5 km away from the Site) via Jack in the Box Creek. This catchment is classified as an intermittent surface watercourse, with some sections being constructed before reaching Wodonga Creek. This catchment is also fed by small gullies inferred to reflect ephemeral drainages originating from Bears Hill and shallow drainage channels that run across the western-most portion of the Site. The gullies and drainage channels are typically dry but were observed to have pools of surface water during and following periods of heavy rainfall (Golder, 2020b). ▪ **Middle Creek / Kiewa River Catchment (east of the topographic divide):** this catchment includes North Bandiana, East Bandiana and the eastern portion of South Bandiana, which drains towards the Kiewa River via an unnamed creek running north of Middle Creek and discharges to the Kiewa River approximately 2.1 km north of the confluence with Middle Creek (Golder, 2020b). The unnamed creek is an actively modified creek, portions of which have been concreted, which originates from a number of drainage channels and stormwater ponds (wetlands) in the eastern portion of South Bandiana. The Kiewa River originates in the Bogong High Plains and flows north to its confluence with the Murray River. The Kiewa River exhibits seasonal variation in flow, with the highest flows typically observed from August to October following snow melt in the high country (Golder, 2020b).
Hydrogeology	Previous environmental investigations (Golder, 2018) identified that the primary aquifer unit of the Site are Shepparton Fluvium and Colluvium, and with a minimal presence the Coonambigdal Fluvium. The deepest standing water level (SWL) is 35 m BGL (Shepparton formation) and the shallowest 3 m BGL (Coonambigdal formation). ▪ **Depth to Groundwater** – Groundwater occurring from within the Shepparton Colluvium has previously been recorded beneath the Site at levels of between 12 and 35 mBGL and groundwater occurring from the Fluvium formation was recorded at levels between 4m and 8 mBGL and the Coonambigdal is less than 3 mBGL. ▪ **Groundwater Flow Direction** – The flow of groundwater through the Site has two (2) pathways: toward the Wodonga Creek (north-west of the Site) and towards the Kiewa River (north-east of the Site). This divide occurs through central South Bandiana, which is consistent with the local topography. The larger area draining towards the Kiewa River and the difference in groundwater levels from the central portion of South Bandiana to East Bandiana indicates that the Kiewa River is considered likely to act as a regional groundwater discharge zone (Golder, 2020b). ▪ **Groundwater Use** – Regional groundwater use is known to be used for domestic and agricultural purposes (primarily for irrigation of dairy pasture and stock watering). A review of VVG (Visualising Victorian Groundwater) indicated 20 Off-Site registered groundwater bores within a 1km radius of the Site[3]. Bores were registered for the following purposes: – Unknown: four (4) bores (inferred use associated with the water treatment plant), which is located south of East Bandiana – Non-groundwater: four (4) bores

Setting	Description
	– Domestic / stock: eight (8) bores: six (6) are located downgradient to the north-west of South Bandiana, within the catchment area of Jack in the Box Creek and, two (2) are located upgradient to the south to south-west of Bears Hill. – Irrigation: 3 bores, located downgradient to the north-west of South Bandiana, within the Jack in the Box Creek catchment area. – Investigation: one (1) bore, which is located upgradient to the south to south-west of Bears Hill. – It is noted that in the experience of Cardno, groundwater may also be used by persons with unregistered bores not appearing on the database. ▪ **Surface Water and Drainage**: The BMA is located across two (2) catchment areas: Jack in the Box Creek (west of the topographic divide) and Middle Creek / Kiewa River (east of the topographic divide). – West of the topographic divide includes the western portion of the South Bandiana area, and drains towards Wodonga Creek via Jack in the Box Creek, which runs in a north north-westerly direction from the north-west portion of the BMA. Jack in the Box Creek is an intermittent surface watercourse, with sections being constructed before discharging to Wodonga Creek. Upstream, the Creek receives the discharge of gullies and shallow drainage channels that run across the western-most portion of the BMA. The gullies (generally dry) are inferred to reflect ephemeral drainages originating from Bears Hill that have been modified by human activity over time (Golder, 2020c). – East of the topographic divide includes the eastern portion of South Bandiana, North Bandiana and East Bandiana. This divide drains towards Kiewa River via the unnamed creek, which runs north of Middle Creek. The unnamed creek originates in the eastern portion of South Bandiana as a number of drainage channels. This subsequently discharges to a series of stormwater ponds (wetlands) located at the entry of South Bandiana. Some portions of this Creek have been concreted within North Bandiana. It is noted that its course is actively modified as a result of further residential development downstream North Bandiana (Golder, 2020c). In the area surrounding the Site, groundwater is expected to flow north-east and north-west towards the Kiewa River and Wodonga Creek respectively. Groundwater flow contours are shown on Figure 2, Appendix A as per previous SAQP (Golder, 2018).
Environmental Sensitive Areas	Several surface water bodies flow On-Site and Off-Site. According to the two (2) identified catchments at the Site, the Kiewa River located at 2.1 km north-east and the Wodonga Creek located at 3.5 km north-west are the primary environmentally sensitive areas that receive discharge from smaller creeks, such as Jack in the Box Creek and the unnamed creek.
Wetlands	The Site includes several open drainage channels that collect surface water runoff mainly from South Bandiana and North Bandiana. These drainage channels form part of the unnamed creek and discharge to a series of stormwater ponds that are considered wetlands.
Further information can be found in the DSI report (Golder, 2018) and the PMAP (Golder, 2020b). *1. 2.2 Conceptual Site Model

The Conceptual Site Model (CSM) for the Site is provided in Appendix C of the PMAP (Golder, 2022b) to identify major/minor sources, migration pathways, exposure routes and receptors (current and future).

The CSM was based on numerous PFAS investigations, including:

> Golder (2018), PFAS Detailed Site Investigation, Bandiana Military Area, September 2018.

> Golder (2020a), Human Health and Ecological Risk Assessment, Bandiana Military Area, November 2020.

> Golder (2020b), Bandiana Military Area, PFAS Management Area Plan, November 2020.

> GHD (2016), Defence per- and poly-fluoroalkyl Substances (PFAS), Environmental Management Preliminary Sampling Program, Albury Wodonga Military Area (Bandiana), September 2016.

2.2.1 Source Areas

Previous investigations identified several Source Areas where PFAS has been detected in soil, surface water or groundwater at concentrations exceeding the adopted assessment levels. These are shown in Figure 2, Appendix A, and include the following:

South Bandiana:

- Source Area 1 (SA1) – Petroleum Platoon – Former Fire training Ground.
- Source Area 2 (SA2) – Base Fire Services (BFS) – Former Fire Training Ground.
- Source Area 5 (SA5) – Petroleum Platoon – Fuel Handling Facility.
- Source Area 6 (SA6) – Current Fire Training Area, Building 600.
- Source Area 7 (SA7) – Old Fire Station, Building 421.
- Source Area 9 (SA9) – Petroleum, Oils and Lubricants (POL), Building 490.

North Bandiana:

- Source Area 10 (SA10) – Former Unit Training Area, between Warehouse 1 and 2.
- Source Area 11 (SA11) – Fire Extinguisher Disposal – Warehouse 13.
- Source Area 12 (SA12) – Armoured Vehicle Maintenance Training, Building 100

East Bandiana:

- Source Area 13 (SA13) – Fire Station – Current.
- Source Area 14 (SA14) – Former Unit Training, Building 592.
- Source Area 15 (SA15) – Former Unit Training – Football Field.

The highest On-Site concentrations of PFAS in soil, sediment, surface water and groundwater were generally identified within and adjacent to source areas, indicating the soil and sediment within source areas are continuing to act as a source of PFAS identified within the On-Site and Off-Site Jack in the Box Creek and Kiewa River catchments (Golder, 2020b).

Areas of soil contamination that exceeded residential human health screening levels were limited to identified On-Site source areas, which are not used for residential purposes. Given the reported concentrations of PFAS in soil and grass, and the nature and behaviour of PFAS in the environment, there is the potential for risk to aquatic ecosystems Off-Site.

PFAS concentrations were detected above the limit of reporting for drinking water and recreational groundwater guideline values in some On-Site groundwater monitoring wells located in the vicinity of Source Areas SA1, SA7, SA9, SA12, SA13, SA14, and SA15 (Golder, 2018). Off-Site PFAS concentrations were detected in two (2) groundwater monitoring wells (lower Jack in the Box Creek Catchment) and in one (1) groundwater monitoring well located in the floodplain on the Kiewa River Catchment. In both cases, the drinking water guidance values were exceeded. It is also noted that PFAS was found to exceed the drinking water guideline values in an extraction bore (for irrigation and chickens drinking water purposes) in a property within the Management Area.

Drainage channel sampling identified detectable concentrations of PFAS. The highest concentrations were reported close to identified source areas. Off-Site, exceedances of low PFAS concentrations were reported in most surface water samples.

The DSI (Golder, 2018) concluded that concentrations of PFAS in soil, sediment and surface water exceed the adopted ecological screening criteria On-Site and Off-Site in the Jack in the Box Creek and Kiewa River catchments (Golder, 2020b).

Following the completion of the DSI, a number of areas of uncertainty or data gaps were identified, including:

- The nature and extent of On-Site surface water contamination;

- Representativeness of groundwater sampling at some locations;
- Location of the groundwater flow divide and extent of groundwater impacts;
- Concentrations in Off-Site surface water during low flow conditions;
- Soil, sediment, surface water and groundwater interactions; and
- PFAS discharges in sewer.

Where possible, these areas of uncertainty will be addressed through implementation of the OMP or through additional investigations as part of the PMAP delivery (Golder, 2020b).

2.2.2 Migration Pathway

The key migration pathways of PFAS off South Bandiana and North Bandiana is via surface water which flows primarily into Jack in the Box Creek and then the Wodonga Creek. In East Bandiana the key migration pathway Off-Site is via surface water and groundwater which both flow towards the Kiewa River.

Key potential and existing exposure pathways include:

- Ingestion of impacted water for drinking or cooking purposes;
- Home production of food (such as livestock, fruit and vegetables, fish and eggs) using impacted water and consumption of home-produced food;
- Direct contact with impacted soil, sediment, surface water and/or groundwater for human and ecological receptors;
- Incidental ingestion of impacted soil, sediment, surface water/or groundwater for human and ecological receptors; and
- Bioaccumulation in ecological receptors through ingestion of other impacted flora and fauna.

2.2.3 Receptors

Potential current and future receptors On-Site include Defence military personal, personnel residing in temporary accommodation On-Site, contractors and visitors, teachers and children at Bandiana Primary School, adults and children attending the Neighbourhood House and sheep in South Bandiana.

Off-Site potential and existing current and future receptors include residents, commercial/industrial workers, recreational users, livestock and terrestrial and aquatic ecosystems (Golder, 2020c).

3 Data Quality Objectives

This SAQP has been developed based on a set of Data Quality Objectives (DQO) in reference to the DQO presented in the DSI (Golder, 2018), and based on guidance presented in the US Environmental Protections Agency (EPA, 2006), and NEPM 2013 (Schedule B2). The DQO process comprises the following seven steps:

- Step 1: State the problem
- Step 2: Identify the Decision
- Step 3: Identify the Information Inputs
- Step 4: Define the Boundaries of the Study
- Step 5: Develop the Analytical Approach
- Step 6: Specify Performance or Acceptance Criteria
- Step 7: Develop the Plan for Obtaining the Data

The DQOs are detailed in Table 3-1.

Table 3-1 Data Quality Objectives

Data Quality Step	Description (Golder, 2020b)
State the Problem	Some protected environmental values of surface water and groundwater within some Off-Site areas have been precluded[1]. However, the HHERA (Golder, 2020a) concluded that the human health risks to both On-Site and Off-Site receptors, under current exposure conditions are low and acceptable. The only potentially unacceptable human health risks were associated with unrealised scenarios, which were assessed as part of the HHERA to inform stakeholders of potential future risks. Ongoing monitoring is required to be undertaken as part of the BMA PMAP to assess potential changes in receptor exposure conditions. These include the assessment of changes related to precluded protected beneficial use.
Identify the Decision	The goal of the OMP is to monitor the nature and extent of PFAS impacts, and to identify trends and changes to PFAS impacts in the Management Area. This will allow decisions to be made regarding the assessment of risks to human and ecological receptors into the future (i.e. Updating the conceptual site model), and whether the OMP need to be amended e.g. increasing concentrations may require increased monitoring locations and/or frequencies or decreasing concentrations may warrant a decrease in the frequency or number of locations.
Identify the Information Inputs	The primary information inputs include observations and data obtained through the collection and analysis of representative samples of sediment, surface water and groundwater. The following additional information inputs will also apply: ▪ Objectives and scope of works of this OMP; ▪ Updates to national regulations and guideline documentation, particularly published assessment criteria; and ▪ Information gathered through stakeholders regarding specific land use practices within the Management Area. Particularly, information pertinent to the exposure conditions assessed within the HHERA (Golder, 2020c).
Define the Boundaries of the Study	Ongoing monitoring will be undertaken within the Management Area as presented in Figure 1, Appendix A. This includes On-Site and Off-Site areas.
Develop the Analytical Approach	The purpose of this step is to define the parameters of interest, specify action levels and combine the outputs of the previous DQO steps to develop a series of options if certain trigger events occur. The key decision rules for the OMP are: ▪ Has the analytical data collected met the Data Quality Indicators (DQI) required by the NEMP (HEPA, 2020) and the SAQP? ▪ Have stable, increasing or decreasing trends in PFAS concentrations been established using appropriate statistical methods? ▪ Do PFAS concentrations exceed the guidelines and/or the trigger values established within the HHERA? If so, does this indicate an unacceptable level of risk? If so, is a review of the PMAP required?
Specify Performance or Acceptance Criteria	The key acceptance criteria for the OMP are: ▪ The acceptable field and laboratory DQIs will be in accordance with NEMP 2.0 (HEPA, 2020) and NEPM (2013) and must be detailed in the SAQP. A review of data quality is to be undertaken and documented to minimise the potential for decisions errors. ▪ The adopted guideline values will be in accordance with the NEMP 2.0 (HEPA, 2020) as updated and will be used to screen analytical results obtained and to determine whether a revision of risk is required. ▪ The laboratory limit of reporting (LOR) should be below the adopted guideline values where technically possible.
Develop the Plan for Obtaining the Data	The OMP provides a list of the proposed monitoring locations, frequencies, and analysis. This SAQP has been developed prior to beginning the monitoring program.

Notes:
1. Protection of beneficial uses has been updated to environmental values to reflect the updates to Victorian Legislation, Environmental Reference Standard (EPA, 2021)

An assessment of the Data Quality Indicators (DQIs) relating to both field and laboratory procedures will be undertaken with appropriate documentation provided for each environmental element or media assessed. The DQIs adopted for the DSI are summarised in Table 3-2.

Table 3-2 Data Quality Indicators

Data Quality Indicator	Detail
QA Documentation	Provision of appropriate work plans, DQI and DQO defined for the Site and all QA/QC aspects documented.
Bias	A measure of the potential distortion in an analysis which can result in errors in one direction (e.g. one laboratory consistently higher results or consistent poor spiked matrix recovery). Bias will be assessed with reference to the analysis of spiked matrix samples (NEPC, 2013).
Representativeness	A qualitative measure of the confidence that data is representative of each medium present on the Site. Use of appropriate and documented sampling methods, sampling handling, preservation and transport and holding times.
Precision:	A quantitative measure of data variability or reproducibility, measured by the calculation of %RPD values for duplicate samples (i.e. measure of agreement). Precision in DQI can be measured as follows: • Percentage of the mean of the measurement such as Relative Percent Difference (i.e. %RPD). The %RPD will be calculated for the field and secondary duplicate (i.e. inter and intra-laboratory analysis); and • Use of similar analytical method and instrument (e.g. for inter-laboratory assessment). The %RPD will be considered as acceptable if the values are less than 30% (NEPC, 2013). Should there be a result that is greater than 30% difference, then a "review should be conducted of the cause (e.g. instrument calibration, appropriateness of method used)" (NEPC, 2013). Laboratory analysis of intra- and inter-laboratory samples (1 per 10 samples collected) to be collected.
Accuracy	A quantitative measure of the closeness of data to a 'true value', measured by the analysis of spike, blank and laboratory control samples (LCS). The LCS consists of a standard reference material or a matrix of known concentration. For the purpose of assessing accuracy it is required that at least one LCS for each process batch[1] be analysed (NEPC, 2013).
Comparability	A qualitative measure of the confidence that data may be considered to be equivalent for each sampling and analytical event. By use of standard procedures, comparable methods, qualified personnel and review of sample integrity. When all results have been received, Cardno will undertake a full review of the data for any anomalies in consideration of historical data at each location (where available), such as first-time detections or exceedances being reported at locations which have not had detections or exceedances previously. If potentially anomalous data is identified or suspected, further confirmatory measures will be undertaken such as re-extraction and reanalysis of the sample by the laboratory and/or additional data quality review.
Completeness	A measure of the amount of usable data (expressed as a percentage - %) from a data collection activity, based on completeness of test program, overall QA/QC completeness and validity of data set.

Notes:
1. The NEPM Schedule B3 – Guideline on Laboratory Analysis of Potentially Contaminated Soil defines a laboratory process batch to consist of up to "20 samples that are similar in terms of matrix and test procedure, and are processed as one unit for the QC purposes" (NEPC, 2013).

4 Sampling Location Rationale and Methodology

4.1 Monitoring Schedule

The proposed monitoring intervals for surface water, sediment and groundwater as outlined in the OMP (Golder, 2020c) are as follows:

Table 4-1 Monitoring Intervals

Media	Locations	Frequency	Rationale
Surface Water	All	Biannual ▪ August to October ▪ February to May	Surface water is the primary pathway for PFAS resulting in exposure to human and ecological receptors. The OMP states that consideration should be made to conduct surface water sampling after "reasonable rain events" (>35mm over 4 days). Cardno will endeavour to complete sampling following reasonable rain events if they occur during the sampling event. A review of weather forecast will be taken into consideration when planning of sampling activities. August to October time period is to target when high flows are generally exhibited (defined as water level >1.5 m and discharge >1,500 mL/day[1]). February to May time period is to target when low flows are generally exhibited (defined as water levels <1.0 m and discharge <1,000 mL/day[1]).
Sediment	All	Annual ▪ February to May	Timing in February to May to correspond with surface water sampling undertaken in low flow conditions.
Groundwater	OMC and Shepparton Colluvium Locations	Annual ▪ August to October	Sampling is proposed in August to October for these wells as groundwater in these units was deep (>12 m below ground) and lower hydraulic conductivities were observed.
	Shepparton Fluvium and Coonambigdal Fluvium	Biannual ▪ August to October ▪ February to May	Sampling is proposed biannually during February to May and August to October as groundwater in these units is shallow and higher hydraulic conductivities were observed. Additionally, biannual sampling is proposed as these well locations generally exhibited higher PFAS concentrations, are the primary pathway for PFAS from East Bandiana, and are likely to have a greater interaction with surface water (Golder, 2020c). Four annual groundwater sampling locations were altered to a biannual sampling frequency following the 2021 November/December event. This was due to significant increases in PFAS concentrations being reported at two On-Site locations compared with previous monitoring results. Two additional downgradient locations were included to monitor the potential for any PFAS migration and changes in risk profile. The appropriateness of a biannual sampling frequency for these locations will be reviewed again prior to each future monitoring event.

Notes:

1. **Water levels and discharge rates from Kiewa River gauge station 402222, accessed via https://riverdata.mdba.gov.au/bandiana**

4.2 Groundwater Monitoring

4.2.1 Monitoring Locations

The network of on- and Off-Site groundwater monitoring wells sampled as part of the OMP (Golder, 2020c) is summarised in Table 4-2 and shown in Figures 4A and 4B, Appendix A. Location codes for some locations have been updated after issue of the OMP. A table summarising location codes that have been updated is included in Appendix C. A table of available well construction details is also included in Appendix C.

Table 4-2 BMA Groundwater Monitoring Network

Catchment	Frequency	Monitoring Location	Total Number of Monitoring Locations	Target Area	Justification
On-Site Locations					
Jack in the Box Creek	Annual (August to October)	MW315, MW317, MW318	3	South Bandiana, On-Site, **Source Area 2**	Locations target groundwater within and downgradient of the source area.
		MW311	1	South Bandiana, On-Site, **Source Area 1**	Locations target groundwater within and downgradient of the source area.
	Bi-Annual	MW304, MW307	2	South Bandiana, On-Site, **Source Area 1**	Locations target groundwater within and downgradient of the source area.
		MW312	1	South Bandiana, On-Site	A point of discharge Off-Site into Jack in the Box Creek.
	Annual (August to October)	MW051, MW416, MW323	3	South Bandiana, On-Site, **Source Area 6**	Locations target groundwater discharge from Source Area 6.
		MW329	1	South Bandiana, On-Site, **Source Area 5**	Locations target groundwater discharge from Source Area 5 and 6.
		MW319, MW321	2	South Bandiana, On-Site, **Source Area 7**	Locations target groundwater discharge from Source Area 7.
Kiewa River		MW056[1]	1	South Bandiana, On-Site, **Source Area 9,** and Stormwater Ponds (wetlands)	Location targets perched groundwater identified within Source Area 9.
	Bi-Annual	MW342, MW345, MW346	3	North Bandiana, On-Site, Source Areas **10, 11 and 12**	Locations target contributions from Source Areas 10, 11 and 12.
		MW052, MW403, MW404, MW350_S, MW350_D, MW009, MW016, MW042, MW043, MW035, MW034, MW046I, MW046_D MW018, MW020, MW012, MW029, MW352, MW353, MW354	20	East Bandiana, On-Site, **Source Area 13, 14 and 15**	Locations target the East Bandiana Groundwater plume, which is emanating from Source Area 13 and discharging Off-Site across the eastern site boundary.
		MW351	1	East-Bandiana, On-Site	Location targets the downgradient boundary adjacent to the residential properties.
Off-Site Locations					

Jack in the Box Creek	Annual (August to October)	MW313	1	Upper Jack in the Box Creek	Location targets the residential estate located beyond the South Bandiana boundary.
	Bi-Annual	MW360	1	Lower Jack in the Box Creek	Locations target Lower Jack in the Box Creek where potential surface water/groundwater interactions may be occurring.
		MW361	1		
Kiewa River		MW357	1	Unnamed Creek and Kiewa River ox-bows	Location targets the point where the Unnamed Channel discharges into the Kiewa River.
		OTH019	1	Kiewa River ox-bows	A point of use location, where bore water is used for irrigation of home grown produce and drinking water for chickens.
		MW356	1	Kiewa River – main channel	Location targets the assessment of groundwater/surface water interactions at the Kiewa River.
1. MW056 was not sampled as scheduled in the E5 annual sampling event. It will be sampled in the upcoming E6 event and again in the E7 (normal frequency) to provide an additional data point, as it has not been sampled since October 2022.					

4.2.2 Groundwater Sampling Methodology

Groundwater monitoring will be undertaken by no purge HydraSleeve® method as detailed in Table 4-3.

Table 4-3 Groundwater Monitoring Wells – Sampling Method

Activity	Details
Well Gauging	Standing Water Level (SWL) will be gauged using either an interface probe or a water level meter. All wells will be measured against a specified mark at the top of the well casing. A consolidated groundwater gauging event for the wells to be monitored in a particular event will be undertaken at the commencement of each monitoring event to the extent practicable. Wells which have specific or difficult access constraints, or which are not scheduled for sampling in a particular event, will not be included.
Groundwater Field Parameters	Groundwater field parameters will be recorded with a water quality meter before sample collection (with the sample in a sterilised jar) prior to deployment of the HydraSleeve™, or using extra sample water from within the HydraSleeve™ decanted into a sterilised jar if the HydraSleeve™ is already deployed. The following field parameters will be recorded using a water quality meter: ▪ pH. ▪ electrical conductivity (EC). ▪ oxidation reduction potential (ORP). ▪ Dissolved oxygen (DO). ▪ Temperature. All field instruments (e.g. water quality meter) will be calibrated prior to field events to optimise the accuracy of the measurements taken. The water quality meter will be bump tested daily and re-calibrated as required.
Deployment of HydraSleeve®	HydraSleeves™ will be either deployed to the base of wells, or a minimum of 2.5m within the screen interval. If sufficient water column is available, the HydraSleeve™ will be positioned such that it does not sit at the base of the well where sediment may be present. HydraSleeve™ sampling devices will be left in wells for a minimum of 4 hours when deployed with bottom weights only, to allow restabilisation of the well following the slight disturbance caused by sampler deployment. For wells with a shallow water column (nominally less than 2.5 m in height, although depending on the length of the HydraSleeve™), HydraSleeve™ sampling devices will be deployed with both top and bottom weights, and will be left in the well for a minimum of 24 hours. This is to allow the top weight time to compress the HydraSleeve™ into the bottom

Activity	Details
	of the well and restabilisation of the well following the slight disturbance caused by sampler deployment. Available well construction details, including screen intervals, are presented in Appendix C.
Retrieval of HydraSleeves® (Sample Collection)	Samples will be collected via continuous pull method at a rate of approximately 30 cm per second, allowing the water to pass through the check value into the sample sleeve. Samples will be discharged immediately (to minimise changes in chemistry) via discharge tube.
Sample collection by bailer	Where insufficient water is retrieved with the HydraSleeve™, samples will be collected by bailer. Wells will be purged 3 bore volumes, or until dry, whichever is sooner, prior to sample collection.
Sample collection from tap	For wells with no direct access due to being encased or containing an in-well pump, such as private property bore OTH019, a sample will be collected from the tap or other available outlet to allow sampling of water from the bore. Where samples are collected from a tap or similar outlet, the well is to be purged by running the tap for 1 minute prior to sample collection.
Sample identification, preservation transport and holding times	Each sample will be labelled with the sample location, date, project identification number and sampler's initials. Sample labelling and naming will be in accordance with Annex L of the DCMM (Defence, 2021b). Samples will be collected directly in into appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under Chain of Custody (COC) documentation. Sample containers, preservation procedures, sample storage requirements and holding times will be undertaken in accordance with the requirements set out in Australian Standard AS/NZS 5567.1:1998 and AS 4482.1.
Field Records	Field records will include the following information: ▪ Sampling time, date and name of the sampler. ▪ Weather conditions. ▪ Sample collection method. ▪ Sampling equipment decontamination procedures where non-disposable sampling equipment is utilised. ▪ Calibration and bump test records. All sample documentation including field notebooks, reporting records, COC and equipment calibration certificates and procedures will be retained within project files.
Decontamination	Used HydraSleeves™ will be replaced with a new HydraSleeve™ after sample collection at each location, thus removing the need for decontamination. All re-usable sampling equipment (such as the interface probe) will be thoroughly washed using phosphate-free detergent (Liquinox), then double rinsed with de-ionised water before the sample collection.
Waste Management	All liquid wastes generated from the OMP activities will be temporarily stored On-Site (in an agreed location as approved by Base) within either a drum or an Intermediate Bulk Container (IBC) and disposed of Off-Site to a licensed facility. Disposal of the liquid waste is anticipated to occur once the drum(s) or container(s) are full, or as required. Any general solid waste generated during the sampling event will be disposed of either Off-Site or in appropriate bins On-Site, as approved by Base Support.
Laboratory Testing	All groundwater samples will be analysed for the full PFAS analytical suite (see Appendix B). The laboratory Limit of Reporting (LOR) for groundwater, PFAS – Full Suite – 28 Analytes, is 0.01-0.1 µg/L.
Laboratory Testing – Quality Control	Groundwater QC samples will be collected at the following frequencies, in accordance with the guidance in the PFAS NEMP (HEPA, 2020): ▪ Field duplicate (intra-laboratory) samples at 1 per 10 water samples or 1 per batch if the batch is less than 10 samples. ▪ Field triplicate (inter-laboratory) samples at 1 per 10 water samples to be sent to the secondary laboratory. ▪ Rinsate blank sample at 1 per day [collected off re-used sampling equipment (e.g. interface probe)].

Activity	Details
	▪ Trip blank samples of 1 per shipment to be included in the chilled sample containers upon transport to the laboratory. All QC samples will be tested for a full PFAS analytical suite (see Appendix B).
Laboratory Accreditation	All groundwater analysis will be undertaken by the following NATA-accredited laboratories: ▪ Primary analysis will be undertaken by ALS Global Laboratories. ▪ Secondary analysis will be undertaken by Eurofins.

4.3 Surface Water Monitoring

4.3.1 Monitoring Locations

The surface water locations sampled as part of the OMP (Golder, 2020c) are presented in Figures 3A and 3B (Appendix A) and are summarised in Table 4-4.

Table 4-4 OMP Surface Water Monitoring Locations and Frequency

Catchment	Frequency	Monitoring Location	Total Number of Monitoring Locations	Target Area	Justification
On-Site Locations					
Jack in the Box Creek	Bi-Annual	SW302, SW307, SW310	3	South Bandiana, On-Site, **Source Area 2**	Locations target surface water within and downgradient of the source area.
		SW311, SW313, SW316, SW321	4	South Bandiana, On-Site, **Source Area 1**	Locations target surface water within and downgradient the source area.
		SW322	1	South Bandiana, On-Site	Location targets surface water downgradient of the source area.
		SW323	1	South Bandiana, On-Site	Location targets drainage Off-Site downgradient of Source Areas 5, 6 and 7.
		SW324, SW326, SW332, SW336	4	South Bandiana, On-Site, **Source Area 6**	Locations target surface water discharge from Source Area 6.
		SW333, SW338	2	South Bandiana, On-Site, **Source Area 5**	Locations target surface water discharge from and downgradient of Source Areas.
Kiewa River	Bi-Annual	SW340	1		
Jack in the Box Creek	Bi-Annual	SW448	1	South Bandiana, On-Site, **Source Area 7**	Location targets surface water discharge from Source Area 7.
Kiewa River	Bi-Annual	SW346, SW349, SW355	3	South Bandiana, On-Site, **Source Area 9,** and Stormwater Ponds (wetlands)	Surface water locations target discharge into, within and discharging from the South Bandiana Stormwater Ponds.
		SW370, SW374, SW375	3	North Bandiana, On-Site, Source Areas **10, 11 and 12**	Locations target contributions from Source Areas 10, 11 and 12.
		SW379, SW380	2	East Bandiana, On-Site, **Source Area 13, 14 and 15**	Locations are targeting surface water discharge from Source Area 13.
		SW382, SW387, SW388	3	East-Bandiana, On-Site	Locations target surface water at the points of discharge from

					East Bandiana into the Kiewa River, and the Kiewa River floodplain.
Off-Site Locations					
Jack in the Box Creek	Bi-Annual	SW424, SW463	2	Upper Jack in the Box Creek	Locations target publicly accessible open space land use areas.
		SW427	1	Lower Jack in the Box Creek	Locations are targeting surface water along Jack in the Box Creek.
		SW430	1		
		SW431	1		
		SW432	1		Location targets several downgradient Off-Site sources identified within the DSI.
		SW434	1	Jack in the Box and Wodonga Creek confluence	Represents the down gradient point of monitoring within the Management Area within the Jack in the Box Creek catchment.
Kiewa River	Bi-Annual	SW409	1	Unnamed Creek	Location targets the creek near sensitive land use areas.
		SW403, SW405, SW412, SW462	4	Unnamed Creek and Kiewa River ox-bows	Locations target surface water Unnamed Creek and Kiewa River ox-bows downgradient of East and North Bandiana.
		SW395, SW396, SW397, SW400, SW401, SW470, SW471, SW487	8	Kiewa River ox-bows	Locations target the ox-bow lakes downgradient of East Bandiana source areas.
		SW390	1	Kiewa River – main channel	Kiewa River background location and represents conditions upstream of the Baranduda WTP and Middle Creek.
		SW393	1	Middle Creek	Location represents potential contributions from the Middle Creek catchment.
		SW398, SW404	2	Kiewa River – main channel	Locations target Kiewa River main channel and represents conditions downgradient of the On-Site discharges.
		SW416	1		Downgradient point of monitoring within the Management Area within the Kiewa River catchment.

4.3.2 Surface Water Sampling Methodology

The methodology for the surface water monitoring is detailed in Table 4-5.

Table 4-5 Surface Water Monitoring Methodology

Item	Details
Field parameters	Surface water physiochemical parameters (i.e. pH, electrical conductivity (EC), oxidation reduction potential (ORP), dissolved oxygen (DO), and temperature) will be recorded at the time of sampling using a pre-calibrated water quality meter. The water quality meter will be bump tested daily and re-calibrated as required. Field observations such as colour, turbidity, presence of suspended solids and odours, sheen, oily film, nuisance organisms, floating debris or frothing will be recorded on field sampling sheets. The condition of the water body that was sampled from including the type (lake, stream etc.) and channel width will also be recorded as applicable. Flow rate will also be quantitatively recorded where possible using the float method, with qualitative flow rates to be recorded where quantitative measurements are unable to be taken by field staff (such as when environmental conditions significantly limit visibility or there are access constraints).
Sampling Method	Where possible, surface water samples will be collected directly into laboratory supplied sample containers using a 'Grab' (manual) sample method via a long-handled sampling device. The sample container is secured to the end of the sampling device and is then lowered into the water, oriented with the capped opening facing downwards to avoid the collection of surface films. Where depth permits, the sample container should be positioned at least 10 cm below the surface water level and above the sediment bed before reorienting the sample container so that the capped opening is facing upwards, allowing it to fill. Samples will be collected in accordance with Australian/New Zealand Standards (AS/NZS 5667.1:1998) '*Water quality – Sampling – Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples*'.
Sample Collection	Water samples will be placed directly into appropriately labelled, laboratory supplied sample bottles and packed in chilled containers for delivery to the laboratory under COC documentation. Sample containers will include water resistant labels attached to the sample bottles.
Sample identification, preservation, transport and holding times.	Each sample will be labelled with the sample location, date, project identification number and sampler's initials. Sample labelling and naming will be in accordance with Annex L of the DCMM. Samples will be contained in appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under COC documentation. Sample containers, preservation procedures, sample storage requirements and holding times will comply with the requirements set out in "Australian Standard AS/NZS 5567.1:1998 and AS 4482.1".
Field Records	Field records will include the following information: ▪ Sampling time, date and name of the sampler. ▪ Weather conditions. ▪ Sample collection method. ▪ Sampling equipment decontamination procedures where non-disposable sampling equipment is utilised. ▪ Calibration records. All sample documentation including field notebooks, reporting records, COC and equipment calibration certificates and procedures will be retained within project files.
Decontamination	All re-usable sampling equipment (such as the long-handled sampling device) will be thoroughly washed using phosphate-free detergent (Liquinox), then double rinsed with de-ionised water before the sample collection.
Laboratory Testing	All surface water samples will be analysed for the full PFAS analytical suite (see Appendix B). The LOR for surface water, PFAS – Full Suite (28 Analytes), is 0.01-0.1 µg/L.
Laboratory Testing – Quality Control	Surface water QC samples will be collected at the following frequencies in accordance with the guidance in the PFAS NEMP (HEPA, 2020): ▪ Field duplicate (intra-laboratory) samples at 1 per 10 water samples or 1 per batch if the batch is less than 10 samples. ▪ Field triplicate (inter-laboratory) samples at 1 per 10 water samples to be sent to the secondary laboratory. ▪ Rinsate blank sample at 1 per day [collected off re-used sampling equipment (e.g. interface probe)].

Item	Details
	▪ Trip blank samples of 1 per shipment to be included in the chilled sample containers upon transport to the laboratory. QC samples will be tested for a full PFAS analytical suite (see Appendix B).
Laboratory Accreditation	All surface water analysis will be undertaken by the following NATA-accredited laboratories: ▪ Primary analysis will be undertaken by ALS Global Laboratories. ▪ Secondary analysis will be undertaken by Eurofins.

4.4 Sediment Monitoring

4.4.1 Monitoring Locations

The sediment locations sampled as part of the OMP (Golder, 2020c) are presented in Figures 3A and 3B (Appendix A) and are summarised in Table 4-6.

Table 4-6 OMP Sediment Monitoring Locations and Frequency

Catchment	Frequency	Monitoring Location	Total Number of Monitoring Locations	Target Area	Justification
On-Site Locations					
Jack in the Box Creek	Annual (February to May)	SD323	1	South Bandiana, On-Site	Locations targets sediment down gradient of Areas 5, 6 and 7.
Kiewa River		SD346, SD355	2	South Bandiana, On-Site, **Source Area 9,** and Stormwater Ponds (wetlands)	Locations are targeting sediment from the South Bandiana Stormwater Ponds.
		SD375	1	North Bandiana, On-Site, Source Areas **10, 11 and 12**	Locations targets sediment down gradient of Source Areas 10, 11 and 12.
		SD382	1	East-Bandiana, On-Site	Location targets the points of discharge from East Bandiana into the Kiewa River, and the Kiewa River floodplain.
Off-Site Locations					
Jack in the Box Creek	Annual (February to May)	SD424, SD463	2	Upper Jack in the Box Creek	Locations are targeting down gradient of sources within South Bandiana
Kiewa River		SD412	1	Unnamed Creek	Locations are targeting impacts of North Bandiana within the Unnamed Creek
		SD395, SD396, SD397, SD400	4	Kiewa River ox-bows	Locations are targeting sediment within ox-bow lakes located on the Kiewa River floodplain within the Southern Pastoral Area.

4.4.2 Sediment Sampling Methodology

The methodology for sediment sampling is detailed in Table 4-7.

Table 4-7 Sediment Monitoring Methodology

Item	Details
Sample Collection	Sediment samples should be collected from the approximate mid-point of the flow pathway, to the extent practicable, and collected from the top ten centimetres using hand tools (e.g. sediment corer, hand auger or trowel). Sediment samples should be collected after the co-located surface water sample is collected to prevent agitating sediments into the water body and surface water sample matrix. Samples should be placed directly into appropriately labelled, laboratory supplied sample containers and packed in chilled containers for delivery to the laboratory under COC documentation. At each sampling location, the sediment sample will be visually assessed and observations (including physical description) recorded on field data sheets.
Field Records	Field records will include the following information: ▪ Sampling time, date and name of the sampler. ▪ Weather conditions. ▪ Sample collection method. ▪ Sampling equipment decontamination procedures where non-disposable sampling equipment is utilised. All sample documentation including field notebooks, reporting records, COC and equipment calibration certificates and procedures will be retained within project files.
Decontamination	All re-usable sampling equipment (such as a trowel) will be thoroughly washed using phosphate-free detergent (Liquinox), then double rinsed with de-ionised water before the sample collection.
Sample identification, preservation, transport and holding times.	Each sample will be labelled with the sample location, date, project identification number and sampler's initials. Sample labelling and naming will be in accordance with Annex L of the DCMM (Defence, 2021b). Samples will be contained in appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under COC documentation. Sample containers, preservation procedures, sample storage requirements and holding times will comply with the requirements set out in "Australian Standard AS/NZS 5567.1:1998 and AS 4482.1".
Laboratory Testing	All sediment samples will be analysed for the full PFAS analytical suite (see Appendix B). The LOR for sediment, PFAS – Full Suite (28 Analytes), is 0.0002-0.001 mg/kg.
Laboratory Testing – Quality Control	Sediment QC samples will be collected at the following frequencies in accordance with the guidance in the PFAS NEMP (HEPA, 2020): ▪ Field duplicate (intra-laboratory) samples at 1 per 10 sediment samples or 1 per batch if the batch is less than 10 samples. ▪ Field triplicate (inter-laboratory) samples at 1 per 10 sediment samples to be sent to the secondary laboratory. All QC samples will be tested for a full PFAS analytical suite (see Appendix B).
Laboratory Accreditation	All sediment sample analysis will be undertaken by the following NATA-accredited laboratories: ▪ Primary analysis will be undertaken by ALS Global Laboratories. ▪ Secondary analysis will be undertaken by Eurofins.

4.5 Quality Control Contingency Measures

In the event there are any issues identified with quality control samples, such as detects being reported in a blank, Cardno will request the laboratories to undertake a detailed review of the results, and to carry out re-analysis of the sample (if necessary) to confirm the detect. In the event that the detect in a blank is confirmed, Cardno will notify Defence and include a discussion as to the potential cause or source of the detect in the blank sample, if it can be determined, in the QA/QC evaluation prepared for each factual report. The QA/QC evaluation will also include discussion of any RPD exceedances, internal laboratory quality outliers or other data quality issues which are identified during the sampling event, and whether any of these issues are considered to impact on the overall reliability and usability of the data set.

4.6 Data Management

All data collected as part of the monitoring program will be reviewed and managed in accordance with the requirements of Annex L of the DCMM (Defence, 2021b), and uploaded into Defence's Environmental Data Management Software (EDMS). Data management will include the following:

- The Defence ESdat email address (DERP.LabReports@esdat.com.au) will be included on CoCs as a laboratory report recipient;
- The laboratory Project ID and the laboratory provided ESdat files will be populated to match the Project ID setup in the Defence ESdat;
- The location code and sample naming conventions outlined in Annex L of the DCMM will be followed;
- Field data will be uploaded to Defence's EDMS; and
- Laboratory data will be uploaded to Defence's EDMS, associated QA/QC data will be reconciled, and the laboratory data will be approved.

5 Assessment Criteria

5.1 Groundwater and Surface Water

The assessment levels adopted for groundwater and surface water in this SAQP are based upon the PFAS screening criteria specified in the OMP (Golder, 2020c), which were adopted based on the guidance in the PFAS NEMP (HEPA, 2020). The adopted assessment criteria for groundwater and surface water are detailed in Table 5-1. Screening levels will be reviewed and updated (if deemed necessary) as part of the OMP review process.

Table 5-1 PFAS Criteria for Groundwater and Surface Water

Exposure Scenario	Adopted Assessment Criteria		Guidance
	PFHxS and PFOS[4]	PFOA	
	µg/L		
Human Health – Surface Water Recreational	2[2]	10	PFAS NEMP (HEPA, 2020)
Human Health – Drinking Water Quality Guideline[1]	0.07[2]	0.56	PFAS NEMP (HEPA, 2020)
Ecological (99% species protection – high conservation value systems)	0.00023[3]	19	PFAS NEMP (HEPA, 2020)
Ecological (95% species protection – slightly to moderately disturbed systems)	0.13[3]	220	PFAS NEMP (HEPA, 2020)

1. Drinking Water screening guidelines have been adopted for screening purposes for Industrial Water use, Stock Water use and Agriculture/Parks/Gardens Water use.
2. Combined PFOS and PFHxS.
3. PFOS only; For 99% species protection, the criterion of 0.00023 µg/L is lower than the laboratory level of reporting (LOR), however, the PFAS NEMP (HEPA, 2020) allows for the adoption of the laboratory LOR as a screening level rather than a quantified measurement.
4. Where the guidance values refer to the sum of PFOS and PFHxS, this includes PFOS only, PFHxS only, and the sum of the two.

5.2 Sediment

It is noted that there are currently no Australian regulatory endorsed assessment levels for risk posed to ecology or human health by PFAS in sediment.

6 Deviations from the OMP

Details of deviations from the OMP (Golder, 2020c) and the associated impacts are as follows:

Table 6-1 OMP Deviations

Detail	Justification	Impact
Sampling frequency increased from annual to bi-annual at MW304, MW307, MW312 and MW342.	Four annual groundwater sampling locations were altered to a biannual sampling frequency following the 2021 November/December event. This was due to significant increases in PFAS concentrations being reported at two On-Site locations compared with previous monitoring results. Two additional downgradient locations were included to monitor the potential for any PFAS migration and changes in risk profile. The appropriateness of a biannual sampling frequency for these locations has been reviewed prior to each monitoring event and is still deemed appropriate.	No impact - increased frequency of sampling at these locations will allow for more timely monitoring of any PFAS migration and changes in risk profile.
Sampling of alternate wells MW325 and MW328, to replace blocked well MW326.	During the May 2022 Sampling event, damage to well MW326 at South Bandiana was observed. Damage included broken stickup housing and casing and a blockage suspected to be caused by debris entering the well, rendering the well unable to be sampled. Field Staff attempted to remove blockage, purge and sample well but were unsuccessful. During the October 2022 sapling event, two alternative groundwater wells, MW325 (downgradient) and MW328 (upgradient) targeting Source Area 6 were sampled to fill this data gap.	Moderate impact - as well MW326 is considered to be a critical location by the lead consultant (LC). However, wells MW325 and MW328 were sampled as replacements to provide data upgradient and downgradient of MW326.
Replacement of well MW326 with MW416.	In April 2023, MW326 was replaced by a new groundwater monitoring well MW416 in the same location.	No impact - the data gap is considered closed as this location is now able to be monitored by MW416.

7 Reporting

7.1 Factual Reporting

A factual report should be produced at the completion of each monitoring event that summarises the data and findings of each monitoring event. The report will be prepared in accordance with the Defence *PFAS OMP Factual Report Guidance* document (Department of Defence, 2021a). Each factual report will present the findings and contain the following information:

- Introduction.
- Scope of work completed.
- Field activities undertaken and description of sampling methodologies used.
- Field observations (e.g. condition of monitoring wells, description of purged water) and water quality parameter measurements.
- Use of appropriate nomenclature of sampling locations as per Defence Contamination Management Manual (DCMM) Annex L.
- Summary of any changes to the monitoring network condition that may affect data integrity, or require rectification works, and recommendations for repair, replacement or decommissioning of a location.
- Evaluation of the applicability of adopted assessment criteria.

- Review of the suitability of the data for assessment purposes (QA/QC evaluation).
- Summary tables presenting gauged groundwater levels.
- Presentation of inferred groundwater contours and inferred groundwater flow direction in a figure.
- Summary tables of analytical results in comparison to adopted assessment criteria generated through management of data on the Defence ESdat database, and naming of sampling locations as per DCMM Annex L.
- Figures showing results in accordance with the OMP Factual Report preparation guidance.
- Laboratory reports, COC documentation, field sampling records, data validation and QA/QC details, equipment calibration certificates, bump test records and other relevant documentation.
- Any deviations from the SAQP encountered during completion of the sampling event, justification for the deviations and any impacts of these changes on the data or program.

In the event that further investigation, management and/or remediation are required, recommendations will be presented in a separate 'technical memorandum'.

It is noted that projects are active and laboratory data is to be received by the Defence ESdat Web Interface at the time of laboratory reporting to the consultant (Department of Defence, 2019). The data are live and location data will be uploaded and reconciled as received.

7.2 Ongoing Monitoring Reporting

Upon completion of each monitoring period, an ongoing monitoring report (OMR) will be prepared in accordance with the Defence *PFAS OMP Annual Interpretive Report Guidance* document (Department of Defence, 2022). As a minimum, each ongoing monitoring report should include the following:

- The factual information described in Section 7.1.
- Evidence of compliance with the requirements of the SAQP and meeting stated objectives of the OMP.
- Relevant figures depicting sampling locations and site-specific hydrogeological features.
- Use of appropriate nomenclature of sampling locations as per DCMM Annex L.
- Laboratory results and analysis including comparison with relevant screening criteria as identified in each OMP; data to be managed through the Defence ESdat database, and naming of sampling locations as per DCMM Annex L.
- Assessment and commentary on appropriate QA/QC procedures.
- A discussion of analytical results in relation to the following:
    - Trends in PFAS concentrations, including an assessment of temporal changes and/or changes to the extent of PFAS impacts. Trends should be assessed using an appropriate statistical analysis approach (e.g. using Mann-Kendall or similar analysis), with a specified level of confidence based upon the number of monitoring rounds completed.
    - Consideration, based on data trends, as to whether any of the existing remediation / management measures should be re-assessed, with a view to potential modification, supplementation or cessation.
    - Assessment of whether changes to the CSM and/or risk assessment are required.
    - Whether recalibration or changes to the groundwater model are required to provide a better understanding of the potential future extent of PFAS impact in groundwater.
- Based on the data obtained, an assessment of the OMP sampling requirements with a view to establishing whether:
    - The number of locations monitored could be reduced, such as where PFAS concentrations are stable and are considered to present a low risk to receptors.
    - Additional monitoring locations are required, including the installation of new monitoring wells or sampling of additional existing wells (and/or private bores) to provide better understanding of the nature, extent or magnitude of PFAS impacts in a particular portion of the Management Area.
    - The frequency of monitoring should increase or decrease to provide better understanding of PFAS concentration fluctuations and potential risks to receptors.

- An overview of remedial works or construction and maintenance activities undertaken in the management area during the reporting period, which may impact the CSM. Defence will assist with understanding other activities occurring within the management area during the monitoring period.
- All deviations from the SAQP encountered in the monitoring period will be documented, along with a statement of how these deviations impact on the DQO or overall objectives of the OMP.
- A statement as to whether the risk profile has changed overall, or at any specific location in the Management Area (On-Site and Off-Site). Based on potential changes to the risk profile, recommendations would be made as to whether this should trigger an OMP and/or PMAP review, or other actions.
- The sampling event Factual Reports and SAQP for the relevant year of monitoring will be appended to the OMR.

In addition to the OMR, a Factsheet summarising the monitoring period and findings will be prepared to accompany the publication of the OMR.

7.3 Provision of Results to Private Property Owners

In addition to the reporting of groundwater, surface water and sediment data collected from private properties in the factual and interpretive reports described in Section 7.1 and Section 7.2, the analytical results of private property sampling will also need to be reported to the property landowners, by way of a factual results letter. The results letters will be delivered to the property owners following Defence review and approval and include the following information, as a minimum:

- A brief description of the purpose of the OMP;
- The PFAS assessment levels relevant at the time of sampling;
- The laboratory LORs;
- The analytical results of the samples collected;
- A description of how the data will be used; and
- Contact details of the appropriate Defence representative.

In the event that the results exceed screening criteria, a follow-up consultation will be conducted with the property owner by telephone unless otherwise directed.

Note: Identifying data for private properties, such as addresses, will not be included on the Defence ESdat database. However, the groundwater, surface water, soil, and sediment data will be included in the ESdat database.

7.4 SAQP Review

Prior to each monitoring event, the SAQP will be reviewed to ensure it complies with the following guidelines:

- PFAS National Environmental Management Plan (NEMP) Version 2.0, HEPA, 2020;
- National Environment Protection (Assessment of Site Contamination) Measure (NEPM), National Environment Protection Council (NEPC), 2013;
- Department of Defence, 2019. Pollution Prevention Guidance - Routine Water Quality Monitoring;
- Standards Australia 1998. AS/NZ 5667:1998 Water quality – sampling;
- Australian and New Zealand Guidelines, 2018. Australian and New Zealand Guidelines for Fresh and Marine Water Quality; and
- State guidelines: Environment Protection Authority (EPA) or equivalent state environmental regulators relevant guidelines e.g. Victoria's Industrial Waste Resource Guidelines (IWRG) Sampling and Analysis of Waters, Wastewaters, Soils and Wastes, Publication 701.

Any changes to the SAQP identified as part of the review are to be documented by way of a revision of the SAQP.

APPENDIX

B

ANALYTICAL SUITE

PFAS Analytical Suite

Group	Analyte
Perfluoroalkane Carboxylates (PFCAs)	Perfluorobutanoic acid (PFBA)
	Perfluoropentanoic acid (PFPeA)
	Perfluorohexanoic acid (PFHxA)
	Perfluoroheptanoic acid (PFHpA)
	Perfluorooctanoic acid (PFOA)
	Perfluorononanoic acid (PFNA)
	Perfluorodecanoic acid (PFDA)
	Perfluoroundecanoic acid (PFUnA or PFUnDA)
	Perfluorododecanoic acid (PFDoA or PFDoDA)
	Perfluorotridecanoic acid (PFTrDA or PFTriDA)
	Perfluorotetradecanoic acid (PFTeDA)
Fluorotelomer Sulfonates (FTSs)	1H,1H,2H,2H-Perfluorohexanesulfonic Acid (4:2 FTS)
	1H,1H,2H,2H-Perfluorooctanesulfonic Acid (6:2 FTS)
	1 H,1H,2H,2H-Perfluorodecanesulfonic Acid (8:2 FTS)
	1H, 1H, 2H, 2H-perfluorododecane sulfonate (10:2 FTS)
Perfluroalkyl sulfonates (PFSAs)	Perfluorobutane sulfonic acid (PFBS)
	Perfluoropentane sulfonic acid (PFPeS)
	Perfluorohexane sulfonate, or perfluorohexane sulfonic acid (PFHxS)
	Perfluoroheptane sulfonate (PFHpS)
	Perfluorooctane sulfonate, or perfluorooctane sulfonic acid (PFOS)
	Perfluorodecane sulfonic acid (PFDS)
Perfluorooctane sulfonamidoethonals and perfluorooctane sulfonamidoacetic acids	N-methylperfluoro-1-octane sulfonamide (N-MeFOSA)
	N-ethyl perfluoro-1-octane sulfonamide (N-EtFOSA)
	2-(N-methyl perfluoro-1-octane sulfonamido)-ethanol (N-MeFOSE)
	N-methyl perfluorooctanesulfonamidoacetic acid (N-MeFOSAA)
	2-(N-ethylperfluoro-1-octane sulfonamido)-ethanol (N-EtFOSE)
	N-ethyl perfluorooctanesulfonamidoacetic acid (N-EtFOSAA)

1 Introduction

1.1 Background

Cardno was engaged by the Department of Defence ("Defence" or "the Client") to carry out the Per- and Poly-Fluoroalkyl Substances (PFAS) Ongoing Monitoring Plan (OMP) at Bandiana Military Area ("the site"). The Bandiana Military Area is comprised of three individual properties identified as North Bandiana (Gaza Ridge Barracks), South Bandiana (Gaza Ridge Barracks) and East Bandiana (Wadsworth Barracks). The location of the site is displayed in Figure 1 of Appendix A.

The OMP was carried out in accordance with the scope and limitations presented in Cardno's Sampling and Analysis Quality Plan (SAQP):

> Cardno, 22 October 2021. Reference: DEF19008, '*PFAS Ongoing Monitoring Plan Sampling and Analysis Quality Plan (SAQP) Bandiana Military Area* ', Rev 1.

For the purposes of this report:

> The Management Area is defined as comprising the site (Figure 1, Appendix A).

1.2 Purpose & Objectives

The objective of the OMP is to assess the changes in the nature and extent of PFAS within the environment, specifically where there is an identified potentially elevated risk to a receptor or a potential future risk to a receptor associated with Defence's historical use of Aqueous Film Forming Foam (AFFF).

The purpose of this PFAS OMP factual report is to provide an up-to-date status of the condition of the site as it is currently understood in relation to the most recent sampling event.

The objectives of the report are:

> To provide a succinct summary of the November/December 2021 sampling event and provision of analytical results with supporting tables and figures.

> To provide confirmation of the current understanding of risk.

> To provide supporting data for the assessment of management actions, where relevant.

1.3 Relevant Guidelines

This assessment has been undertaken in general accordance with applicable industry standards for a site investigation for the purpose, objectives and scope identified in this report. These standards are set out in:

> Australian and New Zealand Guidelines, 2018, *Australian and New Zealand Guidelines for Fresh and Marine Water Quality.*

> Australian Standard AS 4482-2005 *Guide to the investigation and sampling of sites with potentially contaminated soils, Part 1 - Non-volatile and semi-volatile compounds*.

> Department of Defence, Department of Energy, 2018, *Quality System Manual Schedule B15*.

> Heads of Environmental Protection Authority's Australia and New Zealand (HEPA), 2020, *PFAS National Environmental Management Plan (NEMP),* Version 2.0, January 2020.

> National Environment Protection Council (NEPC), 1999, *National Environmental Protection (Assessment of Site Contamination) Measure (as amended 2013)* (ASC NEPM).

> National Health and Medical Research Council (NHMRC), 2019, *Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water*.

> Standards Australia, 1998, AS/NZ 5667:1998 *Water quality – sampling*.

> U.S. Environmental Protection Agency (EPA), 2000, '*Guidance for the Data Quality Objectives Process (EPA QA/G-4)*'.

> USEPA, 2002, '*Guidance on Environmental Data Verification and Data Validation (EPA QA/G-8)'.*

2 Scope of Work

Cardno carried out the following tasks in order to satisfy the purpose and objectives of this assessment.

2.1 Groundwater Monitoring

Sampling of selected groundwater monitoring wells was performed in accordance with the SAQP, applying methods set out in Section 3 of this report. The groundwater monitoring wells monitored as part of the OMP August to October biannual sampling event are presented in Table 2-1, and are shown in Figure 3, Appendix A.

Table 2-1 Groundwater Monitoring Locations

Monitoring Area	Location ID
On-Site	MW051, MW304, MW307, MW311, MW312, MW315, MW317, MW318, MW319, MW321, MW323, MW326, MW329, MW056, MW342, MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_I, MW046_D, MW052, MW345, MW346, MW350_S, MW350_D, MW351, MW352, MW353, MW354, MW403 and MW404.
Off-Site	MW313, MW360, MWW361, MW356, MW357 and OTH019

2.2 Surface Water Monitoring

The surface water sampling locations monitored as part of the OMP are presented in Table 2-2, and are shown in Figure 4, Appendix A.

Table 2-2 Surface Water Monitoring Locations

Monitoring Area	Location ID
On-Site	SW302, SW307, SW310, SW311, SW313, SW316, SW321, SW322, SW323, SW324, SW326, SW332, SW333, SW336, SW338, SW448, SW340, SW346, SW349, SW355, SW370, SW374, SW375, SW379, SW380, SW382, SW387 and SW388.
Off-Site	SW390, SW393, SW395, SW396, SW397, SW398, SW400, SW401, SW403, SW404, SW405, SW409, SW412, SW416, SW424, SW427, SW430, SW431, SW432, SW434, SW462, SW463, SW470, SW471 and SW487.

2.3 Sediment Monitoring

No sediment sampling was undertaken as part of the August to October biannual sampling event.

2.4 Data Management

All the data included in the report have been collected, uploaded to the ESdat database and reviewed according to the data management requirements of the Defence Contamination Management Manual (DCMM) Annex L.

2.5 Deviations from the OMP SAQP

Deviations from the SAQP were attributed to a lack of sampling media or access constraints, as summarised in 0. On-site and off-site sampling and testing was undertaken at 42 groundwater monitoring wells and 52 surface water locations. Four groundwater monitoring wells were sampled with an alternative sampling method (bailer). One groundwater monitoring well was sampled with an alternative sampling method (from a nearby tap supplied by the well) as the well was fully encased. Two groundwater monitoring wells and one surface water sampling location could not be sampled as they were found to be dry at the time of sampling.

Table 2-3 Deviations from the SAQP

Location	Deviation	Comment/Justification	Impact on Existing Dataset
Groundwater			
MW020	Alternate sampling method	Bailer sample due to insufficient water for HydraSleeve® deployment.	Minimal impact – samples taken during the Detailed Site investigation (DSI) (Golder, 2018) in 2017 employed low flow micropurge air bladder pump. Sampling technique has differed however unlikely to affect the reported concentrations.
MW315	Alternate sampling method	Bailer sample due to insufficient water for HydraSleeve® deployment.	No impact – Last sampled in 2017 for DSI (Golder, 2018) and a bailer was employed due to insufficient water for HydraSleeve deployment.
MW345	Alternate sampling method	Bailer sample due to insufficient water for HydraSleeve® deployment.	Minimal impact – DSI (Golder, 2018) employed low flow micropurge air bladder pump sampling technique. Sampling technique has differed however unlikely to affect the reported concentrations.
MW353	Alternate sampling method	Bailer sample due to insufficient water for HydraSleeve® deployment.	Minimal impact – DSI (Golder, 2018) employed low flow micropurge air bladder pump sampling technique. Sampling technique has differed however unlikely to affect the reported concentrations.
OTH019	Alternate sampling method	No monitoring well access, sample collected from tap following purging of bore by way of running tap for 1 minute.	No impact – First sampling of location, no historical data with differing sampling method. Ongoing sampling method is expected to be consistent.
MW317	Not Sampled	Bore dry	Low impact – Previously sampled in 2017 during the DSI (Golder, 2018). Reported concentrations were above the LOR for Sum of PFHxS and PFOS and below the LOR for PFOA. Reported concentrations were below the drinking water assessment criteria reported in the 2017 sampling. The closest downgradient well MW315 (approx. 15 m northeast of MW317) reported concentrations below the LOR for PFOA and Sum of PFHxS and PFOS. Both MW315 and MW317 are located within Source Area 2. Groundwater is located greater than 20 mbgl and no groundwater extraction is occurring near Source Area 2.
MW318	Not Sampled	Bore dry	Low impact – Well was dry during the 2017 DSI (Golder, 2018). Downgradient well MW315 reported concentrations below the LOR for PFOA and Sum of PFHxS and PFOS. Both MW315 and MW318 are located within Source Area 2. Groundwater is located greater than 20 mbgl and no groundwater extraction is occurring nearby Source Area 2.
Surface Water			
SW302	Not Sampled	Location dry	Low impact – Location dry in 2017 during the DSI (Golder, 2018). Surface water is expected to flow north. Surface water was sampled in downgradient locations SW307 and SW310.

3 Methodology

3.1 Groundwater Sampling Methodology

Groundwater monitoring was undertaken as detailed in Table 3-1.

Table 3-1 Groundwater Sampling Method

Activity	Details
Dates of Field Activity	8 to 17 November 2021 and 22 December 2021
Well Gauging	Standing Water Levels (SWL) were gauged using an interface probe. All wells were measured against a specified mark at the top of the well casing.
Groundwater Field Parameters	Groundwater water quality parameter field measurements (field parameters) were recorded with a water quality meter before sample collection (with the sample in a clean jar). The following field parameters were recorded using a water quality meter: ▪ pH. ▪ electrical conductivity (EC). ▪ oxidation reduction potential (ORP). ▪ Dissolved oxygen (DO). ▪ Temperature. Field parameters measured by the water quality meter were recorded on field data records. All field instruments (e.g. water quality meter) were calibrated by the equipment supplier to optimise the accuracy of the measurements taken. Bump tests were also completed daily by field staff during the monitoring event. Calibration certificates and bump test records are provided in Appendix D.
Deployment of HydraSleeve	The HydraSleeves® were deployed with attached weights in order for sample collection to begin at the lowest point of the well screen. HydraSleeves® were deployed following the gauging of all wells in the OMP on 8 December 2021.
Retrieval of HydraSleeves (Sample Collection)	New HydraSleeve® sampling devices were deployed. Where only bottom-weights were used, HydraSleeves® were left in wells for a minimum of 4 hours to allow restabilisation of the well following the slight disturbance caused by sampler deployment. Where both top and bottom-weights were used, HydraSleeves® were left in wells for a minimum of 24 hours to allow proper compression of the HydraSleeve® and restabilisation of the well following the slight disturbance caused by sampler deployment. Samples were collected via continuous pull method at a rate allowing the water to pass through the check valve into the sample sleeve. Samples were discharged immediately (to minimise changes in chemistry) via a discharge tube. HydraSleeves® were redeployed after sampling in preparation for the next sampling event.
Sample collection by bailer	As per the SAQP, where insufficient water is retrieved with the HydraSleeve®, samples will be collected by bailer. For bailer sampling, wells will be purged 3 bore volumes, or until dry, whichever is sooner, prior to sample collection.
Decontamination procedure	Dedicated HydraSleeves® were used at each groundwater monitoring well, thus removing the need for decontamination. Where HydraSleeves® could not be used, dedicated bailers were used instead which also did not require decontamination. All re-usable sampling equipment was thoroughly washed using PFAS & phosphate-free detergent, then double rinsed with clean water before the sample collection.

Activity	Details
Sample identification, preservation transport and holding times	Each sample was labelled with the sample location, date, project identification number and sampler's initials. Samples were collected directly into appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under Chain of Custody (CoC) documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998 and AS 4482.1 as appropriate).
Laboratory Testing	All groundwater samples were analysed for the full PFAS analytical suite (see SAQP for full list of analytes). The primary laboratory was ALS Global Laboratories (Springvale), and the secondary laboratory (quality control) was Eurofins (Dandenong South). Both laboratories are NATA-accredited for the parameters tested. Copies of the NATA stamped laboratory reports and Chain of Custody documentation are included in Appendix C.
Laboratory Testing – Quality Control	Groundwater quality control samples were collected as follows and analysed for the full PFAS analytical suite: ▪ Field duplicate (intra-laboratory) samples at 1 per 10 water samples (8 samples). ▪ Field triplicate (inter-laboratory) samples at 1 per 10 water samples (8 samples). ▪ Rinsate blank samples at 1 per day [collected off re-used sampling equipment (e.g. interface probe)] (9 samples total). ▪ Trip blank samples of 1 per shipment included in the chilled sample containers upon transport to the laboratory (5 samples total).

3.2 Surface Water Sampling Methodology

Surface water monitoring was undertaken using a grab method as detailed in Table 3-2.

Table 3-2 Surface Water Sampling Method

Item	Details
Dates of Field Activity	8 to 17 November 2021
Field parameters	Surface water field parameters (i.e. pH, electrical conductivity (EC), oxidation reduction potential (ORP), dissolved oxygen (DO), and temperature) were recorded at the time of sampling using a pre-calibrated water quality meter. Field observations such as odours and flow were also recorded on field sampling sheets.
Sampling Method	Where possible, the samples were collected directly into sample containers. The sample bottles were positioned at least 10 cm below the surface water level and above the sediment bed and orientated with the opening facing downwards to avoid the collection of surface films. Where access to surface water samples was difficult, the samples were collected using a long-handled sampling device with a glass container (scoop) that was lowered directly into the water body. Samples were then decanted into the laboratory-supplied sample containers. Samples were collected in accordance with Australian/New Zealand Standards (AS/NZS 5667.1:1998) '*Water quality – Sampling – Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples'*.
Decontamination	All re-usable sampling equipment (e.g. water scoop) were thoroughly washed using phosphate-free detergent (Liquinox), and subsequently double rinsed with de-ionised water before the sample collection.
Sample identification, preservation, transport and holding times.	Each sample was labelled with the sample location, date, project identification number and sampler's initials. Sample labelling and naming was in accordance with Annex L of the DCMM.

Item	Details
	Samples were contained in appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under Chain of Custody (COC) documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998 and AS 4482.1 as appropriate).
Laboratory Testing	All surface water samples were analysed for the full PFAS analytical suite (see SAQP for full list of analytes). The primary laboratory was ALS Global Laboratories (Springvale), and the secondary laboratory (quality control) was Eurofins (Dandenong South). Both laboratories are NATA-accredited for the parameters tested. Copies of the NATA stamped laboratory reports and Chain of Custody documentation are included in Appendix C.
Laboratory Testing – Quality Control	Surface water quality control samples were collected as follows and analysed for the full PFAS analytical suite: ▪ Field duplicate (intra-laboratory) samples at 1 per 10 water samples (7 samples). ▪ Field triplicate (inter-laboratory) samples at 1 per 10 water samples (7 samples). ▪ Rinsate blank samples at 1 per day [collected off re-used sampling equipment (e.g. long-handled sampling device)] (9 samples total). ▪ Trip blank samples of 1 per shipment included in the chilled sample containers upon transport to the laboratory (5 samples total).

3.3 Quality Control / Quality Assurance

A critical aspect of site assessments is the demonstration of the quality of the data used as the basis for the assessment. This is achieved through a Data Validation process which includes a review of the following data quality indicators, as described in the SAQP:

- QA documentation.
- Bias.
- Data Representativeness.
- Data Precision & Accuracy.
- Data Comparability.
- Data Set Completeness.

A detailed review of these aspects has been undertaken, the results of which are presented in Appendix E. A summary of the data validation from the QA/QC review is included in Section 4.4 below.

3.4 Assessment Criteria

3.4.1 Groundwater and Surface Water

The adopted assessment criteria for groundwater and surface water are detailed in Table 3-3.

Table 3-3 Criteria for Groundwater and Surface Water

Exposure Scenario	Adopted Assessment Criteria		Guidance
	PFHxS / PFOS	PFOA	
	µg/L		
Human Health - Surface Water Recreational	2[2]	10	PFAS NEMP (HEPA, 2020)
Human Health - Drinking Water Quality Guideline[1]	0.07[2]	0.56	PFAS NEMP (HEPA, 2020)
Ecological (99% species protection – high conservation value systems)	0.00023[3,4]	19	PFAS NEMP (HEPA, 2020)

Ecological (95% species protection – slightly to moderately disturbed systems)	0.13[3]	220	PFAS NEMP (HEPA, 2020)

1. Drinking Water screening guidelines have been adopted for screening purposes for Industrial Water use, Stock Water use and Agriculture/Parks/Gardens Water use.
2. Combined PFOS and PFHxS.
3. PFOS only
4. The criterion of 0.00023 µg/L is lower than the laboratory level of reporting (LOR), however, the PFAS NEMP (HEPA, 2020) allows for the adoption of the laboratory LOR as a screening level rather than a quantified measurement.

4 Field Observations and Results

4.1 Conditions Impacting the Sampling Event

In the seven days prior to the sampling event (November 1 to November 7), 31.4 mm of rain was recorded at the nearest weather station (082056), located in Wodonga. During the sampling event (November 8 to November 17), 51.8 mm of rain was recorded at weather station 082056. The total rainfall observed in November 2021 (144.2 mm) was significantly higher than the historical average of 49.8 mm (1898 to 2021). All surface water sampling locations, excluding difficult to access on-base and Kiewa river locations (9 total), were sampled following a large rain event between 12 to 14 November resulting in sampling during periods of higher than average surface water flow. Kiewa River gauge station 402222 recorded a water level of 2.688 m and discharge of 3,380 mL/day on 15 November 2021, above the 1.5 m water level and 1,500 mL/day discharge as per the SAQP.

No on-site activities with the potential to impact sample collection or the results were noted.

4.2 Groundwater

4.2.1 Summary of Field Observations

4.2.1.1 Water quality parameter field measurements

Stabilised water quality parameter field measurements, water colour and turbidity observations recorded during the groundwater sampling program are presented in field sampling record sheets, included in Appendix D. Groundwater varied from clear to brown with low to medium turbidity and no notable changes were recorded relative to the DSI (Golder, 2018) observations.

4.2.1.2 Groundwater Elevation and Migration

Groundwater elevation and migration across the three bases included in the PFAS OMP summarised below:

- South Bandiana: Groundwater elevations observed at South Bandiana during the sampling event ranged from 160.332 mAHD at MW304 to 166.525 mAHD at MW329. Slight groundwater mounding was observed at MW329. Groundwater flow is inferred to be in a north-westerly direction toward the Jack in the Box Creek. Groundwater elevations and flow direction were generally consistent with those reported during the DSI investigation.
- North Bandiana: Groundwater elevations observed at North Bandiana during the sampling event ranged from 163.315 mAHD at MW345 to 166.536 mAHD at MW342. Groundwater flow is inferred to be in an easterly direction toward the Kiewa River. Groundwater elevations and flow direction were generally consistent with those reported during the DSI investigation.
- East Bandiana: Groundwater elevations observed at East Bandiana during the sampling event ranged from 160.713 mAHD at MW052 to 155.484 mAHD at MW356. Groundwater flow is inferred to be in an easterly direction toward the Kiewa River. Groundwater elevations and flow direction were generally consistent with those reported during the DSI investigation.

Groundwater elevation contours and flow directions for November 2021 are shown in Figure 3, Appendix A. Gauging records are presented in Appendix D.

4.2.2 Groundwater Laboratory Results

The results of laboratory analysis have been compared against adopted assessment criteria, and are presented in Table B1, Appendix B, and summarised in Table 4-1 below. Of the 42 primary samples that were tested, PFOA was reported above the limit of reporting in 21 samples, and Sum of PFHxS and PFOS in 34 samples.

Table 4-1 Summary of Groundwater Results Exceeding Adopted Criteria

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR[3]	No. Results Above Drinking Water Criteria[3]	Significant Concentration Changes[4]
PFOS	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_D, MW046_I, MW052, MW056, MW307, MW312, MW319, MW321, MW326, MW329, MW342, MW345, MW350_D, MW350_S, MW352, MW353, MW354, MW360, MW361, MW403, MW404, OTH019	0.00023[2]	70.4	35	-	MW307, MW342, (increase)
PFOA	MW043, MW052, MW307, MW350_S, MW403, MW404	0.56[1]	34.2	21	6	MW307, MW342, (increase)
Sum of PFHxS and PFOS	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_D, MW046_I, MW052, MW056, MW307, MW312, MW319, MW321, MW326, MW329, MW342, MW345, MW350_D, MW350_S, MW353, MW354, MW360, MW361, MW403, MW404, OTH019	0.07[1]	422	34	31	MW307, MW342, (increase)

Note:

1. Drinking water assessment criteria
2. Ecological assessment criteria
3. Non-inclusive of quality control samples
4. Significant concentration change defined as an order of magnitude increase or decrease

Results have also been compared against available historical data (DSI) (Golder, 2018). The following locations have reported a significant change in concentration for this monitoring event:

- MW307: Sum of PFHxS and PFOS has increased by 3 orders of magnitude from a previous result of 0.37 µg/L in December 2017 to 422 µg/L in this event.
- MW342: Sum of PFHxS and PFOS has increased by 2 orders of magnitude from a previous result of 0.09 µg/L in December 2017 to 13.5 µg/L in this event.
- MW307: PFOA has increased by 3 orders of magnitude from a previous result of 0.01 µg/L in December 2017 to 34.2 µg/L in this event.
- MW342: PFOA has increased by 2 orders of magnitude from a previous result of below LOR in December 2017 to 0.22 µg/L in this event.
- All other concentrations reported during this event were generally consistent with previous sampling events.

Due to inconsistent results compared to the historical concentrations at MW307 and MW342, re-sampling of these locations was undertaken on 22 December 2021. Re-sampling results were generally consistent with the November 2021 reported PFAS concentrations. The above concentrations reported for MW307 and MW342 are from November 2021.

A summary of locations where a first-time detection, or a new exceedance of guideline values, of PFOS, Sum of PFHxS and PFOS, or PFOA, were reported is provided in Table 4-2 below. The laboratory reports are provided in Appendix C.

Table 4-2 Summary of Groundwater Results with First-time Detections or Exceedances

Deviation Type	Monitoring Well	Sum of PFHxS + PFOS concentration (µg/L)		PFOA concentration (µg/L)		PFOS concentration (µg/L)	
		November 2021	Previous Maximum	November 2021	Previous Maximum	November 2021	Previous Maximum
First-time detections	MW312	**0.16**	**0.12**	<0.01	<0.01	0.02	<0.01
	MW342	**13.5**	**0.09**	0.22	<0.01	9.21	<0.01
First-time exceedance of the NEMP (HEPA, 2020) drinking water guidelines	MW307	**422**	**0.37**	**34.2**	0.01	70.4	0.25
	MW326	**0.29**	0.03	<0.01	<0.01	0.03	0.03
	MW329	**0.17**	0.02	<0.01	<0.01	0.03	0.02

Note:
Location with first-time detection of PFOS + PFHxS, PFOA or PFOS in latest monitoring round
Location with a new exceedance of drinking water guideline values in latest monitoring round
Bold: Exceedance of drinking water guideline values
Exclusive of quality control samples.

Findings are summarised as follows:

- One groundwater sampling location (MW342) reported a first-time detection of PFOA.
- Two groundwater sampling locations (MW312 and MW342) reported a first-time detection of PFOS.
- No groundwater sampling locations reported a first-time detection of Sum of PFHxS + PFOS.
- Two groundwater sampling locations (MW326 and MW329) reported a first-time exceedance of the Drinking Water criteria for Sum of PFHxS and PFOS.
- One groundwater sampling location (MW307) reported a first-time exceedance of the Drinking Water criteria for PFOA.
- Due to a first-time exceedance of PFOA at MW307 and a first-time detection of PFOS and PFOA at MW342 as well as significant PFAS concentration increases, re-sampling of these locations was undertaken on 22 December 2021. Re-sampling results were generally consistent with the November 2021 results. The above concentrations reported for MW307 and MW342 are from November 2021.

4.3 Surface water

4.3.1 Summary of Field Observations

4.3.1.1 Water quality parameter field measurements

Stabilised water quality parameter field measurements, water colour and turbidity observations recorded during the surface water sampling program are presented in field sampling record sheets, included in Appendix D. Surface water varied from clear to brown with low to high turbidity. During the DSI investigation a large number of on-base locations were unable to be sampled due to being dry. These locations that were included in the OMP (excluding SW302) had water observed in them for the first time.

4.3.2 Surface Water Laboratory Results

The results of laboratory analysis have been compared against adopted assessment criteria, presented in Table B2, Appendix B, and summarised in Table 4-3 below. Of the 52 primary samples that were tested, PFOA was reported above the limit of detection in 28 samples, and Sum of PFHxS and PFOS in 46 samples.

Table 4-3 Summary of Surface Water Results Exceeding Adopted Criteria

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR[3]	No. Results Above Drinking Water Criteria[3]	Significant Concentration Changes[4]
PFOS	SW307, SW310, SW311, SW313, SW316, SW321, SW322, SW323, SW324, SW326, SW332, SW333, SW336, SW338, SW340, SW346, SW349, SW355, SW370, SW374, SW375, SW379, SW380, SW387, SW388, SW395, SW396, SW397, SW400, SW401, SW403, SW405, SW409, SW412, SW424, SW427, SW430, SW431, SW432, SW434, SW448, SW462, SW463, SW470, SW471, SW487	0.00023[2]	7.99	46	-	SW434 (increase) SW332, SW382 (decrease)
PFOA	-	0.56[1]	0.38	28	0	-
Sum of PFHxS and PFOS	SW307, SW310, SW311, SW313, SW316, SW321, SW322, SW323, SW324, SW326, SW333, SW336, SW338, SW340, SW346, SW349, SW355, SW370, SW374, SW375, SW379, SW380, SW387, SW388, SW395, SW396, SW397, SW400, SW401, SW403, SW405, SW424, SW427, SW430, SW431, SW432, SW448, SW462, SW463, SW470, SW471, SW487	0.07[1]	10.10	46	42	SW434 (increase) SW332, SW382 (decrease)

Note:
1. Drinking water assessment criteria.
2. Ecological assessment criteria.
3. Non-inclusive of quality control samples.
4. Significant concentration change defined as an order of magnitude increase or decrease.

Results have also been compared to available historical data. The following locations have reported a significant change in concentration for this monitoring event:

- SW332: Sum of PFHxS and PFOS has decreased by two orders of magnitude from 4.45 µg/L in November 2017 to 0.04 µg/L in this event.
- SW382: Sum of PFHxS and PFOS has decreased by one order of magnitude from 0.13 µg/L in November 2017 to below LOR in this event.
- SW434: Sum of PFHxS and PFOS has increased by one of magnitude from 0.0045 µg/L in November 2017 to 0.07 µg/L in this event.

Table 4-4 Summary of Surface Water Results with First-time Detections or Exceedances

Deviation Type	Monitoring Well	Sum of PFHxS + PFOS concentration (µg/L)		PFOA concentration (µg/L)		PFOS concentration (µg/L)	
		November 2021	Previous Maximum	November 2021	Previous Maximum	November 2021	Previous Maximum
First-time detections	SW307	**0.17**	-	<0.01	-	0.07	-
	SW310	**0.32**	-	<0.01	-	0.11	-

	SW326	**10.1**	-	0.03	-	7.99	-
	SW379	**0.58**	-	0.02	-	0.41	-
	SW380	**0.43**	-	<0.01	-	0.34	-
	SW430	**0.16**	0.0618	<0.01	0.0039	0.1	0.0465

Note:
Location with first-time detection of PFOS + PFHxS or PFOA or PFOS in latest monitoring round
Location with a new exceedance of drinking water guideline values in latest monitoring round
Bold: Exceedance of drinking water guideline values
Exclusive of quality control samples.

Findings are summarised as follows:

- Nine sampling locations (SW307, SW310, SW311, SW313, SW321, SW322, SW326, SW379, SW380) reported first-time detections of PFOS and Sum of PFHxS and PFOS. This is the first time these locations were sampled.
- Six sampling locations (SW311, SW313, SW321, SW322, SW326, SW379) reported first-time detections of PFOA. This is the first time these locations were sampled.
- Ten sampling locations (SW307, SW310, SW311, SW313, SW321, SW322, SW326, SW379, SW380, SW430) reported a first-time exceedance of the Drinking Water criteria for Sum of PFHxS and PFOS.

4.4 Data Validation

The data validation process has concluded that there are no significant systematic errors in the data collection process. Therefore, the data set used as the basis for the surface water and groundwater assessment is considered valid and complete. A detailed Data Quality Review is included in Appendix E.

5 Summary and Conclusions

Cardno conducted the November 2021 biannual groundwater and surface water monitoring event at Bandiana Military Area as part of the PFAS OMP. On-site and off-site sampling and testing was undertaken at 42 groundwater monitoring wells and 52 surface water locations.

Groundwater levels were gauged in all accessible wells before sampling. Groundwater was interpreted to flow in a south-westerly direction from South Bandiana towards Jack in the Box Creek, easterly direction from North Bandiana and East Bandiana towards the Kiewa River.

The results of the November 2021 monitoring event do not indicate any changes in the risk profile associated with Defence's historical use of AFFF since the DSI investigation (Golder, 2018). The increases at MW307 and MW342 should be closely monitored in future for any trends. If trends are confirmed then there may well be a change in risk profile.

Table 5-1 Summary of Results

Activity	Details
Deviations from OMP SAQP	> 2 groundwater wells were not sampled due to the well being dry. > 1 groundwater wells were sampled from tap connected to the pump due to there being no direct monitoring well access. > 4 groundwater wells were sampled using bailers instead of HydraSleeves® due to there being insufficient water in the wells. > 1 surface water sampling location was not sampled due to the location being dry. > 2 groundwater wells were resampled in December 2021 due to inconsistent results compared to the DSI investigation.
Groundwater Analytical Results	> 42 groundwater samples were collected in total. > 21 samples reported PFOA concentrations above the limit of reporting. > 34 samples reported Sum of PFHxS and PFOS concentrations above the limit of reporting. > 6 samples reported PFOA concentrations above the adopted assessment criteria. > 31 samples reported Sum of PFHxS and PFOS concentrations above the adopted assessment criteria. > One sample reported a first-time detection of PFOA. > No samples reported a first-time detection of Sum of PFHxS and PFOS. > Two samples reported a first-time detection of PFOS. > One sample reported a first-time exceedance of the Drinking Water assessment criteria for PFOA > Two samples reported a first-time exceedance of Drinking Water assessment criteria for Sum of PFHxS and PFOS.
Surface Water Analytical Results	> 52 surface water samples were collected in total. > 28 samples reported PFOA concentrations above the limit of reporting. > 46 samples reported Sum of PFHxS and PFOS concentrations above the limit of reporting. > No samples reported PFOA concentrations above the Drinking Water assessment criteria. > 42 samples reported Sum of PFHxS and PFOS concentrations above the Drinking Water assessment criteria. > 9 samples reported a first-time detection of PFOS and Sum of PFHxS and PFOS. > 6 samples reported a first-time detection of PFOA. > 10 samples reported a first-time exceedance of the Drinking Water assessment criteria for Sum of PFHxS and PFOS. > No samples reported a first-time exceedance of the Drinking Water assessment criteria for PFOA.
Next Scheduled Monitoring Event	> The next OMP monitoring event is scheduled for May 2022.

Activity	Details
	> OMP to be reviewed by the Lead Consultant to assess potential change in the risk profile associated with increased PFAS concentrations in wells MW307 and MW342. > SAQP to be reviewed and updated as required prior to the next monitoring event.

Notes

Denotes first time detection above LOR in latest monitoring round

Denotes new exceedance of human health screening criteria in latest monitoring round

											Perfluorocarbons

Notes

Denotes first time detection above LOR in latest monitoring round

Denotes new exceedance of human health screening criteria in latest monitoring round

*RPDs have only been considered where a concentration is greater than 1 times the EQL.

**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are:
30 (1-10 x EQL); 50 (10-30 x EQL); 50 (> 30 x EQL))

***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

*RPDs have only been considered where a concentration is greater than 1 times the EQL.

**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are:
30 (1-10 x EQL); 50 (10-30 x EQL); 50 (> 30 x EQL))

***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

CERTIFICATE OF ANALYSIS

Work Order	: **EM2122518**	Page	: 1 of 19
Client	: **CARDNO VICTORIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Contact	: [redacted]
Address	: [redacted]	Address	: [redacted]
Telephone	: ----	Telephone	: [redacted]
Project	: VIC_0445_PFASOMP	Date Samples Received	: 15-Nov-2021 12:15
Order number	: -	Date Analysis Commenced	: 18-Nov-2021
C-O-C number	: 29841	Issue Date	: 22-Nov-2021 10:56
Sampler	: [redacted]		
Site	: Base		
Quote number	: SY/139/19_Bandiana		
No. of samples received	: 41		
No. of samples analysed	: 37		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X: Samples (EM2122518) required dilution due to matrix interferences. LOR values have been adjusted accordingly.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Analytical Results

Dates

Date Samples Received	: 15-Nov-2021 12:15	Issue Date	: 18-Nov-2021
Client Requested Due Date	: 22-Nov-2021	Scheduled Reporting Date	: **22-Nov-2021**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Not Available
No. of coolers/boxes	: 2	Temperature	: 3.4°C - Ice present
Receipt Detail	:	No. of samples received / analysed	: 41 / 37

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Any sample identifications that cannot be displayed entirely in the analysis summary table will be listed below.

EM2122518-002	: 11-Nov-2021 14:35	: 0445_MW029_211111 - Extra containers for QC
EM2122518-015	: 11-Nov-2021 14:39	: 0445_MW350_D_211111 - Extra containers for QC

EM2122518-021	: 10-Nov-2021 11:47	: 0445_SW340_211109 - extra containers for lab QC

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Hi [redacted]

Thanks for sending this through, can I please have the following samples put on hold:

- 0445_QC302_211109
- 0445_QC303_211110
- 0445_QC306_211111
- 0445_QC307_211112

Also [redacted] has submitted the final Compass COCs this morning. Can I please request a courier to pick up 2 eskies of samples from 501 Swanston Street anytime after 2:30pm this afternoon (please make sure this timing is passed onto the couriers as I will not be at the office until then).

Any issues please let me know.

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Senior Organic Chemist	Melbourne Organics, Springvale, VIC

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **WATER**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2122518**	Page	: 1 of 8
Client	: [redacted]	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Telephone	: [redacted]
Project	: VIC_0445_PFASOMP	Date Samples Received	: 15-Nov-2021
Site	: Base	Issue Date	: 22-Nov-2021
Sampler	: [redacted]	No. of samples received	: 41
Order number	: -	No. of samples analysed	: 37

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

No. of samples received	: 11		
No. of samples analysed	: 11		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Receipt Detail	:	No. of samples received / analysed	: 11 / 11

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Any sample identifications that cannot be displayed entirely in the analysis summary table will be listed below.

EM2122519-007 : 12-Nov-2021 08:21 : 0445_SW404_211112 - Extra containers for QC

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **WATER**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2122519**	Page	: 1 of 5
Client	: [redacted]	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Telephone	: [redacted]
Project	: VIC_0445_PFASOMP	Date Samples Received	: 15-Nov-2021
Site	: Public Land	Issue Date	: 22-Nov-2021
Sampler	: [redacted]	No. of samples received	: 11
Order number	: -	No. of samples analysed	: 11

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count		Rate (%)		Quality Control Specification
	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	1	11	9.09	10.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / *Container* / Client Sample ID(s)		Sample Date	Extraction / Preparation			Analysis		
			Date extracted	Due for extraction	Evaluation	Date analysed	Due for analysis	Evaluation

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

No. of coolers/boxes	: 2	Temperature	: 3.4°C - Ice present
Receipt Detail	:	No. of samples received / analysed	: 11 / 11

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Any sample identifications that cannot be displayed entirely in the analysis summary table will be listed below.

EM2122519-007 : 12-Nov-2021 08:21 : 0445_SW404_211112 - Extra containers for QC

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **WATER**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count		Rate (%)		Quality Control Specification

Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	1	11	9.09	10.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

T7e analytical 4rocedures used by AL5 7ave been develo4ed from establis7ed internationally recognised 4rocedures suc7 as t7ose 4ublis7ed by t7e O5EPAV APHAV A5 and SEPM. In 7ouse develo4ed 4rocedures are fully validated and are often at t7e client request.

W7ere moisture determination 7as been 4erformedVresults are re4orted on a dry weig7t basis.

W7ere a re4orted less t7an (<) result is 7ig7er t7an t7e LNRVt7is may be due to 4rimary sam4le extract/digestate dilution and/or insufficient sam4le for analysis.

W7ere t7e LNR of a re4orted result differs from standard LNRVt7is may be due to 7ig7 moisture contentVinsufficient sam4le (reduced weig7t em4loyed) or matrix interference.

W7en sam4ling time information is not 4rovided by t7e clientVsam4ling dates are s7own wit7out a time com4onent. In t7ese instancesVt7e time com4onent 7as been assumed by t7e laboratory for 4rocessing 4ur4oses.

W7ere a result is required to meet com4liance limits t7e associated uncertainty must be considered. Refer to t7e AL5 Contact for details.

Key : CA5 Sumber = CA5 registry number from database maintained by C7emical Abstracts 5ervices. T7e C7emical Abstracts 5ervice is a division of t7e American C7emical 5ociety.
LNR = Limit of re4orting
^ = T7is result is com4uted from individual analyte detections at or above t7e level of re4orting
ø = AL5 is not SATA accredited for t7ese tests.
~ = Indicates an estimated value.

- EP2, 1X hPerhand Polyfluoroalkyl 5ubstances (PFA5): 5am4les received in 20ml or 129ml bottles 7ave been tested in accordance wit7 t7e Q5M9., com4liantVSATA accredited met7od. 60mL or 290mL bottles 7ave been tested to t7e legacy Q5M 9.1 alignedVSATA accredited met7od.
- EP2, 1: 5table isoto4e enric7ed intemal standards are added to sam4les 4rior to extraction. Target com4ounds 7ave a direct analogous internal standard wit7 t7e exce4tion of PFPe5VPFH4AVPFD5VPFTrDA and 10:2 FT5. T7ese com4ounds use an internal standard t7at is c7emically related and 7as a retention time close to t7at of t7e target com4ound. T7e DQN for internal standard res4onse is 90ñ190% of t7at establis7ed at initial calibration. PFN5 is quantified using a certifiedVtraceable standard consisting of linear and branc7ed PFN5 isomers. T7ese 4ractices are in line wit7 recommendations in t7e Sational Environmental Management Plan for PFA5 (Australian HEPA) and also conform to Q5M 9., (O5 DoD) requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2122969**	Page	: 1 of 8
Client	: **CARDNO VICTORIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Telephone	: [redacted]
Project	: VIC_0884_PFASOMP	Date Samples Received	: 15-Nov-2021
Site	: P02	Issue Date	: 28-Nov-2021
Sampler	: [redacted]	No. of samples received	: 1
Order number	: -	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the 7 uality Control Q C(Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrik: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroal) yl Sulfonic Acids	EM2122965--002	Anonymous	**Perfluorohexane sulfonic acid (PFHxS)**	344-86-8	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231A: Perfluoroal) yl Sulfonic Acids	EM2122965--002	Anonymous	**Perfluorooctane sulfonic acid (PFOS)**	1x63-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or ektracted outside of recommended holding times, this should be ta) en into consideration when interpreting results.

This report summarizes ektraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 586, APHA, AS and NEPM(based on the sample container provided. Dates reported represent first date of ektraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any(is provided herein.

Holding time for leachate methods (e.g. TCLP(vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 18 days, mercury 25 days & other metals 150 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is x days; others 18 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not) ey analytes of interest/concern.

Matrik: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroal) yl Substances QPFAS(by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Ektraction QSPE(followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase ektraction QSPE(cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted ektract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD 7 SM 4.3, table B-14 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Ektraction QSPE(for PFAS in water	ORGx2	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase ektraction QSPE(cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted ektract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD 7 SM 4.3, table B-14 requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- Amendment (14/1/22):This report has been amended following a correction to the PFAS Sum for sample #16. All other results unchanged.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2122998**	Page	: 1 of 9
Amendment	: **1**		
Client	: **CARDNO VICTORIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Telephone	: [redacted]
Project	: VIC_0445_PFASOMP	Date Samples Received	: 18-Nov-2021
Site	: Base	Issue Date	: 14-Jan-2022
Sampler	: [redacted]	No. of samples received	: 57
Order number	: -	No. of samples analysed	: 54

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count QC	Count Regular	Rate (%) Actual	Rate (%) Expected	Quality Control Specification
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	54	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	54	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Receipt Detail	:	No. of samples received / analysed	: 12 / 12

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **WATER**

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2122999**	Page	: 1 of 8
Client	: **CARDNO VICTORIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Telephone	: [redacted]
Project	: VIC_0448_PFASOMP	Date Samples Received	: 15-Nov-2021
Site	: Public Lands	Issue Date	: 24-Nov-2021
Sampler	: [redacted]	No. of samples received	: 11
Order number	: -	No. of samples analysed	: 11

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the 7 uality Control Q C(Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Analysis Holding Time Compliance

If samples are identified below as having been analysed or ektracted outside of recommended holding times, this should be ta) en into consideration when interpreting results.

This report summarizes ektraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 546, APHA, AS and NEPM(based on the sample container provided. Dates reported represent first date of ektraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any(is provided herein.

Holding time for leachate methods (e.g. TCLP(vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 25 days & other metals 150 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is x days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not) ey analytes of interest/concern.

Matrik: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroal) yl Substances QPFAS(by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Ektraction QSPE(followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase ektraction QSPE(cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted ektract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD 7 SM 8.3, table B-18 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Ektraction QSPE(for PFAS in water	ORGx2	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase ektraction QSPE(cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted ektract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD 7 SM 8.3, table B-18 requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contact for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: Poor matrix spike recovery for sample EM2125922-012 due to sample matrix interference.
- EP231X: Samples EM2125903 required dilution due to matrix interferences. LOR values have been adjusted accordingly.
- Ionic balances were calculated using: major anions - chloride, alkalinity and sulfate; and major cations - calcium, magnesium, potassium and sodium.
- ED045G: The presence of Thiocyanate, Thiosulfate and Sulfite can positively contribute to the chloride result, thereby may bias results higher than expected. Results should be scrutinised accordingly.
- Sodium Adsorption Ratio (where reported): Where results for Na, Ca or Mg are <LOR, a concentration at half the reported LOR is incorporated into the SAR calculation. This represents a conservative approach for Na relative to the assumption that <LOR = zero concentration and a conservative approach for Ca & Mg relative to the assumption that <LOR is equivalent to the LOR concentration.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Client Requested Due Date	: 06-Jan-2022	Scheduled Reporting Date	: **06-Jan-2022**

Delivery Details

Mode of Delivery	: Client Drop Off	Security Seal	: Not Available
No. of coolers/boxes	: 1	Temperature	: 9.5°C - Ice present
Receipt Detail	:	No. of samples received / analysed	: 9 / 6

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Any sample identifications that cannot be displayed entirely in the analysis summary table will be listed below.

EM2125903-005 : 22-Dec-2021 09:03 : 0445_MW342_211222 - Extra containers for QC

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Subject: RE: LANECON - DEF19008 Sample drop off - Additional Analysis

From: [redacted]
Sent: Thursday, 23 December 2021 10:24 AM
To: [redacted]
Cc: [redacted]
Subject: [EXTERNAL] - DEF19008 Sample drop off

CAUTION: This email originated from outside of ALS. Do not click links or open attachments unless you recognize the sender and are sure content is relevant to you.

Hi [redacted]

I have just dropped off some additional samples from Bandiana which were submitted via ALS compass.

Can I please request the following additional analysis (ALS compass was restricted to only PFAS analysis):

- 0445_MW307_211222 analysis of major anions / cations (5 day TAT).

Please send the SRN through when available.

Cheers,

[redacted]

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2125903**	Page	: 1 of 5
Client	: **CARDNO VICTORIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Telephone	: [redacted]
Project	: VIC_0937_PFASOMP	Date Samples Received	: 23-Dec-2021
Site	: Base Resampling	Issue Date	: 31-Dec-2021
Sampler	: [redacted]	No. of samples received	: 9
Order number	:	No. of samples analysed	: 6

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
ED041G: Sulfate (Turbidimetric) as SO4 2- by DA	EM2125919--001	Anonymous	**Sulfate as SO4 - Turbidimetric**	14808-79-8	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
ED045G: Chloride by Discrete Analyser	EM2125919--001	Anonymous	**Chloride**	16887-00-6	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231B: Perfluoroalkyl Carboxylic Acids	EM2125922--012	Anonymous	**Perfluorohexanoic acid (PFHxA)**	307-24-4	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231B: Perfluoroalkyl Carboxylic Acids	EM2125922--012	Anonymous	**Perfluoroheptanoic acid (PFHpA)**	375-85-9	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231C: Perfluoroalkyl Sulfonamides	EM2125922--012	Anonymous	**N-Methyl perfluorooctane sulfonamidoacetic acid (MeFOSAA)**	2355-31-9	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231D: (n:2) Fluorotelomer Sulfonic Acids	EM2125922--012	Anonymous	**10:2 Fluorotelomer sulfonic acid (10:2 FTS)**	120226-60-0	53.1 %	70.0-130%	**Recovery less than lower data quality objective**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Alkalinity by PC Titrator	ED037-P	WATER	In house: Referenced to APHA 2320 B This procedure determines alkalinity by automated measurement (e.g. PC Titrate) on a settled supernatant aliquot of the sample using pH 4.5 for indicating the total alkalinity end-point. This method is compliant with NEPM Schedule B(3)
Sulfate (Turbidimetric) as SO4 2- by Discrete Analyser	ED041G	WATER	In house: Referenced to APHA 4500-SO4. Dissolved sulfate is determined in a 0.45um filtered sample. Sulfate ions are converted to a barium sulfate suspension in an acetic acid medium with barium chloride. Light absorbance of the BaSO4 suspension is measured by a photometer and the SO4-2 concentration is determined by comparison of the reading with a standard curve. This method is compliant with NEPM Schedule B(3)
Chloride by Discrete Analyser	ED045G	WATER	In house: Referenced to APHA 4500 Cl - G.The thiocyanate ion is liberated from mercuric thiocyanate through sequestration of mercury by the chloride ion to form non-ionised mercuric chloride.in the presence of ferric ions the librated thiocynate forms highly-coloured ferric thiocynate which is measured at 480 nm APHA seal method 2 017-1-L
Major Cations - Dissolved	ED093F	WATER	In house: Referenced to APHA 3120 and 3125; USEPA SW 846 - 6010 and 6020; Cations are determined by either ICP-AES or ICP-MS techniques. This method is compliant with NEPM Schedule B(3) Sodium Adsorption Ratio is calculated from Ca, Mg and Na which determined by ALS in house method QWI-EN/ED093F. This method is compliant with NEPM Schedule B(3) Hardness parameters are calculated based on APHA 2340 B. This method is compliant with NEPM Schedule B(3)
Ionic Balance by PCT DA and Turbi SO4 DA	* EN055 - PG	WATER	In house: Referenced to APHA 1030F. This method is compliant with NEPM Schedule B(3)
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Per- and Polyfluoroalkyl Substances (PFASs)			
Perfluoroalkyl carboxylic acids (PFCAs)	Melbourne	Nov 19, 2021	28 Days
- Method: LTM-ORG-2100 Per- and Polyfluoroalkyl Substances (PFAS)

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
ug/L: micrograms per litre
ppm: Parts per million
ppb: Parts per billion
%: Percentage
org/100mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs..

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM where no positive PFAS results have been reported have been reviewed and no data was affected.

.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).
R16	The LORs have been raised due to the high concentration of one or more analytes

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✗	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Cardno Victoria Pty Ltd
[redacted]

NATA Accredited
Accreditation Number 1261
Site Number 1254

Accredited for compliance with ISO/IEC 17025 – Testing
NATA is a signatory to the ILAC Mutual Recognition Arrangement for the mutual recognition of the equivalence of testing, medical testing, calibration, inspection, proficiency testing scheme providers and reference materials producers reports and certificates.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time
Per- and Polyfluoroalkyl Substances (PFASs)			
Perfluoroalkyl carboxylic acids (PFCAs)	Melbourne	Nov 22, 2021	28 Days
- Method: LTM-ORG-2100 Per- and Polyfluoroalkyl Substances (PFAS)			
Perfluoroalkyl sulfonamido substances	Melbourne	Nov 22, 2021	28 Days
- Method: LTM-ORG-2100 Per- and Polyfluoroalkyl Substances (PFAS)			
Perfluoroalkyl sulfonic acids (PFSAs)	Melbourne	Nov 22, 2021	28 Days

Test Counts						7

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer, that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
ug/L: micrograms per litre
ppm: Parts per million
ppb: Parts per billion
%: Percentage
org/100mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR : No Limit

Results between 10-20 times the LOR : RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% Phenols & 50-150% PFASs..

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM where no positive PFAS results have been reported have been reviewed and no data was affected.

.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code
Method Blank							
Perfluoroalkyl carboxylic acids (PFCAs)							
Perfluorobutanoic acid (PFBA)	ug/L	< 0.05			0.05	Pass	
Perfluoropentanoic acid (PFPeA)	ug/L	< 0.01			0.01	Pass	
Perfluorohexanoic acid (PFHxA)	ug/L	< 0.01			0.01	Pass	
Perfluoroheptanoic acid (PFHpA)	ug/L	< 0.01			0.01	Pass

Comments

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Sample Receipt Advice

Company name:	Cardno Victoria Pty Ltd
Contact name:	[redacted]
Project name:	Not provided
Project ID:	DEF19008
Turnaround time:	5 Day
Date/Time received	Nov 19, 2021 5:50 PM
Eurofins reference	842787

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✗	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

Samples received by the laboratory after 5.30pm are deemed to have been received the following working day.

Contact

If you have any questions with respect to these samples, please contact your Analytical Services Manager:

[redacted] **on phone :** [redacted] **or by email:** [redacted]

Results will be delivered electronically via email to [redacted]

Note: A copy of these results will also be delivered to the general Cardno Victoria Pty Ltd email address.

Sample History

Where samples are submitted/analysed over several days, the last date of extraction is reported.

If the date and time of sampling are not provided, the Laboratory will not be responsible for compromised results should testing be performed outside the recommended holding time.

Description	Testing Site	Extracted	Holding Time

Internal Quality Control Review and Glossary

General

1. Laboratory QC results for Method Blanks, Duplicates, Matrix Spikes, and Laboratory Control Samples follows guidelines delineated in the National Environment Protection (Assessment of Site Contamination) Measure 1999, as amended May 2013 and are included in this QC report where applicable. Additional QC data may be available on request.
2. All soil/sediment/solid results are reported on a dry basis, unless otherwise stated.
3. All biota/food results are reported on a wet weight basis on the edible portion, unless otherwise stated.
4. Actual LORs are matrix dependant. Quoted LORs may be raised where sample extracts are diluted due to interferences.
5. Results are uncorrected for matrix spikes or surrogate recoveries except for PFAS compounds.
6. SVOC analysis on waters are performed on homogenised, unfiltered samples, unless noted otherwise.
7. Samples were analysed on an 'as received' basis.
8. Information identified on this report with blue colour, indicates data provided by customer that may have an impact on the results.
9. This report replaces any interim results previously issued.

Holding Times

Please refer to 'Sample Preservation and Container Guide' for holding times (QS3001).

For samples received on the last day of holding time, notification of testing requirements should have been received at least 6 hours prior to sample receipt deadlines as stated on the SRA.

If the Laboratory did not receive the information in the required timeframe, and regardless of any other integrity issues, suitably qualified results may still be reported.

Holding times apply from the date of sampling, therefore compliance to these may be outside the laboratory's control.

For VOCs containing vinyl chloride, styrene and 2-chloroethyl vinyl ether the holding time is 7 days however for all other VOCs such as BTEX or C6-10 TRH then the holding time is 14 days.

Units

mg/kg: milligrams per kilogram
mg/L: milligrams per litre
µg/L: micrograms per litre
ppm: parts per million
ppb: parts per billion
%: Percentage
org/100mL: Organisms per 100 millilitres
NTU: Nephelometric Turbidity Units
MPN/100mL: Most Probable Number of organisms per 100 millilitres

Terms

Dry	Where a moisture has been determined on a solid sample the result is expressed on a dry basis.
LOR	Limit of Reporting.
SPIKE	Addition of the analyte to the sample and reported as percentage recovery.
RPD	Relative Percent Difference between two Duplicate pieces of analysis.
LCS	Laboratory Control Sample - reported as percent recovery.
CRM	Certified Reference Material - reported as percent recovery.
Method Blank	In the case of solid samples these are performed on laboratory certified clean sands and in the case of water samples these are performed on de-ionised water.
Surr - Surrogate	The addition of a like compound to the analyte target and reported as percentage recovery.
Duplicate	A second piece of analysis from the same sample and reported in the same units as the result to show comparison.
USEPA	United States Environmental Protection Agency
APHA	American Public Health Association
TCLP	Toxicity Characteristic Leaching Procedure
COC	Chain of Custody
SRA	Sample Receipt Advice
QSM	US Department of Defense Quality Systems Manual Version 5.4
CP	Client Parent - QC was performed on samples pertaining to this report
NCP	Non-Client Parent - QC performed on samples not pertaining to this report, QC is representative of the sequence or batch that client samples were analysed within.
TEQ	Toxic Equivalency Quotient
WA DWER	Sum of PFBA, PFPeA, PFHxA, PFHpA, PFOA, PFBS, PFHxS, PFOS, 6:2 FTSA, 8:2 FTSA

QC - Acceptance Criteria

The acceptance criteria should be used as a guide only and may be different when site specific Sampling Analysis and Quality Plan (SAQP) have been implemented

RPD Duplicates: Global RPD Duplicates Acceptance Criteria is 30% however the following acceptance guidelines are equally applicable:

Results <10 times the LOR: No Limit

Results between 10-20 times the LOR: RPD must lie between 0-50%

Results >20 times the LOR : RPD must lie between 0-30%

NOTE: pH duplicates are reported as a range not as RPD

Surrogate Recoveries: Recoveries must lie between 20-130% for Speciated Phenols & 50-150% for PFAS

PFAS field samples that contain surrogate recoveries in excess of the QC limit designated in QSM 5.4 where no positive PFAS results have been reported have been reviewed and no data was affected.

.

QC Data General Comments

1. Where a result is reported as a less than (<), higher than the nominated LOR, this is due to either matrix interference, extract dilution required due to interferences or contaminant levels within the sample, high moisture content or insufficient sample provided.
2. Duplicate data shown within this report that states the word "BATCH" is a Batch Duplicate from outside of your sample batch, but within the laboratory sample batch at a 1:10 ratio. The Parent and Duplicate data shown is not data from your samples.
3. pH and Free Chlorine analysed in the laboratory - Analysis on this test must begin within 30 minutes of sampling. Therefore, laboratory analysis is unlikely to be completed within holding time.Analysis will begin as soon as possible after sample receipt.
4. Recovery Data (Spikes & Surrogates) - where chromatographic interference does not allow the determination of recovery the term "INT" appears against that analyte.
5. For Matrix Spikes and LCS results a dash "-" in the report means that the specific analyte was not added to the QC sample.
6. Duplicate RPDs are calculated from raw analytical data thus it is possible to have two sets of data.

Quality Control Results

Test	Units	Result 1			Acceptance Limits	Pass Limits	Qualifying Code

Comments

This report has been revised (V2) following repeat analysis. PFAS results for sample 0445_QC201_211222 have now been replaced by the repeat results.

Sample Integrity

Custody Seals Intact (if used)	N/A
Attempt to Chill was evident	Yes
Sample correctly preserved	Yes
Appropriate sample containers have been used	Yes
Sample containers for volatile analysis received with minimal headspace	Yes
Samples received within HoldingTime	Yes
Some samples have been subcontracted	No

Qualifier Codes/Comments

Code	Description
N09	Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.
N11	Isotope dilution is used for calibration of each native compound for which an exact labelled analogue is available (Isotope Dilution Quantitation). The isotopically labelled analogues allow identification and recovery correction of the concentration of the associated native PFAS compounds.
N15	Where the native PFAS compound does not have labelled analogue then the quantification is made using the Extracted Internal Standard Analyte with the closest retention time to the analyte and no recovery correction has been made (Internal Standard Quantitation).

Sample Receipt Advice

Company name:	Cardno Victoria Pty Ltd
Contact name:	[redacted]
Project name:	Not provided
Project ID:	DEF19008
Turnaround time:	10 Day
Date/Time received	Dec 23, 2021 9:19 AM
Eurofins reference	852797

Sample Information

✓	A detailed list of analytes logged into our LIMS, is included in the attached summary table.
✓	All samples have been received as described on the above COC.
✓	COC has been completed correctly.
✓	Attempt to chill was evident.
✓	Appropriately preserved sample containers have been used.
✓	All samples were received in good condition.
✓	Samples have been provided with adequate time to commence analysis in accordance with the relevant holding times.
✓	Appropriate sample containers have been used.
✓	Sample containers for volatile analysis received with zero headspace.
✗	Split sample sent to requested external lab.
✗	Some samples have been subcontracted.
N/A	Custody Seals intact (if used).

Notes

YSI ProPlus Water Quality Meter

This YSI ProPlus Water Quality Meter has been performance checked as per the manufacturer's guidelines[1].

Unit Type: YSI ProPlus
Serial Number: ~~19H102185~~ 1074758 (RENTAL - ENDIA)

The unit has been checked for and comprises of the following items:

Item	Present	Damaged or Absent?
Carry case	✓	
Attached sensors (x4)	✓	
Spare Batteries	✓	
Connector Cable	✓	
Instruction Manual	✓	

The following tests and operational checks have been conducted on the unit:

Item	Test Completed	Test Passed
WQM unit electrodes cleaned and checked	✓	✓
Operations check (screen functions)	✓	✓
Temperature check	✓	✓

Calibration:

Sensor	Cal. Solution	Value	Reading
pH	pH: Buffer Solution 4.00	4.00	4.00
pH	pH: Buffer Solution 7.00	7.00	7.00
pH	~~pH: Buffer Solution 10.00~~	~~10.00~~	
Redox	Standard ORP solution	235 mV @ 20°c	235 mV @ 20 °c
O_2	Ambient Air for 100% Dissolved Oxygen	100%	100 %
O_2	Sodium Sulphite for 0% Dissolved Oxygen	0%	0.0 % (calibrated)
Conductivity	Standard Conductivity Solution	2.76 µS/cm @ - °c	2.76 mV @ 19 °c auto(calibrated)

DATA QUALITY REVIEW

Data Quality Review
Bandiana Military Area, VIC

This Appendix reviews the Quality Assurance (QA) and Quality Control (QC) documentation. Quality assurance encompasses the actions, procedures, checks and decisions undertaken to ensure sample integrity and representativeness, and the reliability and accuracy of analysis results. The QA documentation should also include an indication of the Data Quality Objectives sought in relation to each significant action, test or process involved in the Assessment.

QC activities measure the effectiveness of the QA procedures by undertaking testing, and then comparing results to previously established objectives. QC work will include the internal laboratory testing as well as results of QC samples submitted such as trip blanks and duplicates. The quality of the information and/or data is deemed satisfactory when the QC results demonstrate that agreed objectives have been met.

Cardno undertook a review of its QA/QC as part of the data validation exercise. The findings are summarised below.

QA/QC Aspects	Evidence and Evaluation
	QA Documentation
Sampling and Analysis Quality Plan and Data Quality Objectives	Cardno was engaged by Department of Defence (the client) to carry out the PFAS Ongoing Monitoring Plan (OMP) of The Bandiana Military Area (the site). The monitoring event commenced on 8 November and concluded 17 November, and is in general accordance with the scope and limitations presented in Cardno's Sampling and Analysis Quality Plan (SAQP) of 22 October 2021 (Our Ref: OMP002_Bandiana_ SAQP_Rev1). The assessment was carried out in general compliance with the following: ▪ Australian Standard AS 4482-2005 Guide to the investigation and sampling of sites with potentially contaminated soils, Part 1 - Non-volatile and semi-volatile compounds. ▪ Australian Standard AS 4482-1999 Guide to the investigation and sampling of sites with potentially contaminated soils, Part 2 - Volatile substances. ▪ Department of Defence (2019), Contamination Management Manual (DCMM), August 2019. ▪ Department of Defence (2019), Pollution Prevention Guideline - Routine Water Quality Monitoring, Department of Defence, Department of Energy, 2018, Quality System Manual Schedule B15. ▪ EPA Victoria (2009), Industrial Waste Resources Guidelines, Sampling and Analysis of Waters, Wastewaters, Soils and Wastes, Publication 701. ▪ Heads of Environmental Protection Authority's Australia and New Zealand (HEPA) (2020), PFAS National Environmental Management Plan (NEMP) Version 2.0, January 2020. ▪ National Environment Protection Council (NEPC), 1999, National Environmental Protection (Assessment of Site Contamination) Measure (as amended 2013) (ASC NEPM). ▪ National Health and Medical Research Council (NHMRC) (2019), Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water, August 2019. ▪ USEPA (2000), Guidance for the Data Quality Objectives Process (EPA QA/G-4). A quality control program was implemented during the investigation and the quality assurance procedures used have been reiterated in the report.

QA/QC Aspects	Evidence and Evaluation
	The investigation was carried out in accordance with the Safe Work method Statements (SWMS) and Occupational Health and Safety (OHS) plan for the site. Detailed work plans were also provided for each phase of investigation and are outlined in the SAQP. The Data Quality Objectives were expressed in terms of the purpose of the assessment and the relevant assessment criteria.
Data Validation Report	This review constitutes a data validation review. This was supported by an Esdat generated "QAQC Checker" excel report, summarised in Tables B3 and B4, Appendix B.
Data Representativeness	
Holding Times	Groundwater and surface water sample analysis holding times were in conformance with EPA Publication IWRG701 2009 *'Sampling and Analysis of Waters, Wastewaters, Soils and Wastes*.
Background Samples	No background samples were collected as part of this assessment.
Equipment Decontamination	The decontamination methodology conducted during this investigation is documented in the body of the report, and was in general conformance with the SAQP and work plans. ▪ Reusable sampling equipment was rinsed with Liquinox® and deionised water prior to the collection of each sample.
Data Precision and Accuracy	
QC Testing – Blind Replicates (Primary Lab)	***Groundwater*** ▪ Acceptance Criteria: RPD < 30% ▪ Groundwater Samples Analysed: 44 (inclusive of repeat samples) ▪ Blind Replicate Samples Analysed: 8 ▪ Blind Replicate Analyte Pairs: 248 ▪ Number of Analyte Pairs Exceeding Criteria: 4 ▪ Percentage of Analyte Pairs Exceeding Criteria: 1.6% RPD exceedances were associated with PFAS compounds. The PFAS RPD exceedances and are likely attributed to low concentrations of analyte pairs. This is not considered to impact the results of the investigation. The RPD results are presented in Table B4, Appendix B. ***Surface water*** ▪ Acceptance Criteria: RPD < 30 % ▪ Surface water Samples Analysed: 52 ▪ Blind Replicate Samples Analysed: 7 ▪ Blind Replicate Analyte Pairs: 217 ▪ Number of Analyte Pairs Exceeding Criteria: 2 ▪ Percentage of Analyte Pairs Exceeding Criteria: 0.9% RPD exceedances were associated with PFAS compounds. The PFAS RPD exceedances and are likely attributed to low concentrations of analyte pairs. This is not considered to impact the results of the investigation. The RPD results are presented in Table B4, Appendix B.
QC Testing – Field Splits (Secondary Lab)	***Groundwater*** ▪ Acceptance Criteria: RPD < 30% ▪ Groundwater Samples Analysed: 44 (inclusive of repeat samples) ▪ Blind Replicate Samples Analysed: 8 ▪ Blind Replicate Analyte Pairs: 248 ▪ Number of Analyte Pairs Exceeding Criteria: 30 ▪ Percentage of Analyte Pairs Exceeding Criteria: 12.1% RPD exceedances were associated with PFAS compounds. Analyte concentrations from the primary sample and their corresponding blind replicate

QA/QC Aspects	Evidence and Evaluation
	sample pairs were all within one order of magnitude. The majority of PFAS RPD exceedances are likely attributed to low concentrations of analyte pairs. This is not considered to impact the results of the investigation. A number of RPD exceedances may also be attributed to interlaboratory differences, which can be common and significant, based on a study done by the Queensland Department of Environment and Science and the Victorian Environment Protection Authority (Vardy et al, 2018). Overall, these RPD exceedances are not considered to impact the results of the investigation. RPD results are presented in Table B4, Appendix B. ***Surface water*** ▪ Acceptance Criteria: RPD < 30 % ▪ Surface water Samples Analysed: 52 ▪ Blind Replicate Samples Analysed: 7 ▪ Blind Replicate Analyte Pairs: 217 ▪ Number of Analyte Pairs Exceeding Criteria: 27 ▪ Percentage of Analyte Pairs Exceeding Criteria: 12.4% RPD exceedances were associated with PFAS compounds. Analyte concentrations from the primary sample and their corresponding blind replicate sample pairs were all within one order of magnitude. The majority of PFAS RPD exceedances are likely attributed to low concentrations of analyte pairs. This is not considered to impact the results of the investigation. A number of RPD exceedances may also be attributed to interlaboratory differences, which can be common and significant, based on a study done by the Queensland Department of Environment and Science and the Victorian Environment Protection Authority (Vardy et al, 2018). Overall, these RPD exceedances are not considered to impact the results of the investigation. RPD results are presented in Table B4, Appendix B.
Trip Blanks	Five (5) trip blanks were collected and laboratory tested for PFAS. All analytes were reported below the limit of reporting (LOR). Trip blank results are presented in Table B4, Appendix B.
Repeat Sampling	Samples from two locations (MW307 and MW342) reported concentrations inconsistent with results reported in 2017 during the DSI (Golder, 2018). These two locations were resampled in December 2021 to confirm the increased concentrations reported. Reported concentrations in December 2021 were consistent with those reported from the November 2021 samples and therefore confirms the November 2021 results.
Laboratory Internal QC	Evidence of the laboratories internal QC testing is present and complete. Both ALS (the primary laboratory) and Eurofins-mgt performed internal QC with adequate testing and mostly satisfactory results for matrix spikes, method blanks and laboratory duplicates.
Laboratory Method Detection Limit	Laboratory reports indicate the method detection limits were generally lower than the respective assessment criteria. The LOR for PFOS in groundwater was 0.01 µg/L, which is above the adopted criterion of 0.00023 µg/L for Maintenance of Ecosystems, however, the PFAS NEMP (HEPA, 2020) allows for the adoption of the laboratory LOR as a screening level rather than a quantified measurement.
NATA endorsement of laboratory reports	Laboratory reports were stamped with the NATA endorsement stamp and signature. Laboratory reports are included in Appendix C of this report.
Calibration of Field Equipment	All field equipment used was calibrated by the equipment supplier. Certificates and daily bump test records are included in Appendix D of this report.
Decontamination and Equipment Blanks	Nine (9) rinsate blanks were collected during the investigation. Rinsate blank samples were tested for PFAS which all reported a concentration below the laboratory LOR. Results are shown in Table B4, Appendix B.

QA/QC Aspects	Evidence and Evaluation
Data Comparability	
Standard Procedures	Fieldwork procedures are detailed in the report and followed the work methods outlined in the SAQP.
Qualified Personnel	Staff involved in managing and reviewing the project and those involved in fieldwork are qualified personnel.
Sample Integrity	Field Chain of Custody forms are included in Appendix C of this report and demonstrate sample integrity.
Data Completeness	
Completeness of Test Program	The scope of work undertaken was generally consistent with that set out in the Sampling and Analysis Quality Plan (SAQP) and Addendum to the SAQP. Variations to the SAQP are detailed in the Factual Report.
Validity of Data Set	The data quality review indicates no significant systematic errors in the data collection process for surface water and groundwater and therefore, the data set used as the basis for the assessment is considered valid and complete.

APPENDIX

F

INFORMATION ABOUT ENVIRONMENTAL REPORTS

About Site Environmental Assessment Reports

1. Introduction

This document explains the Environmental Site Assessment (ESA) process and the context that applies to the use of Environmental Reports issued by Cardno.

2. What is an ESA?

Environmental Site Assessments (ESA) are undertaken for a range of purposes, specific to the brief issued by the client in each case. The scope may include one or a combination of any of the following:

- A factual report of the condition of a portion of the site or one aspect of an entire site.
- Assessment of the contamination levels in soil to be removed from a site – a waste classification assessment.
- Validation of the success of remediation of a site or a portion of a site.
- Provision of a professional opinion about the suitability of a site for one or more uses, in terms of its contamination status.

The scope of any ESA needs to be defined at the outset.

An ESA is not an Environmental Audit. Such audits are undertaken in accordance with the provisions of regulations enacted in various states of Australia, and are referred to as Site Audits in some jurisdictions. Statutory audits provide certification by EPA accredited auditors that a site is suitable for one or more uses. An ESA may provide similar advice but cannot be used in place of an audit if the latter is required by regulation in any instance. However in some circumstances and jurisdictions an ESA is sufficient to provide "environmental sign-off" of a site.

An ESA may be undertaken for due diligence purposes, to establish whether the site has been impacted to the extent that some beneficial uses of the site may be precluded. Due diligence audits in many cases may be completed as non-statutory Audits, although in some jurisdictions they can also be statutory audits, if defined as such at the outset.

3. The ESA Process

The Client generally initiates the ESA process by specifying a brief which identifies the specific objectives of the assessment. If not, it is the consultants' duty to so specify the ESA

In the case of an ESA to provide an opinion about the suitability of the site for use, it would be conducted in accordance with NEPM (Site Assessment). Such ESA would not commence until a thorough site history assessment (Phase 1 Assessment: to identify the potential for significant contamination at a site) is conducted. However, where the history is unclear, a broad screening of chemical parameters can be used to test environmental media. This normally includes a broad range of organic and inorganic compounds and elements, often referred to as an Environmental Screen.

(In the case of an ESA for a purpose other than to provide an opinion about the suitability of the site for use, it is not always necessary to undertake a Phase 1 assessment.)

The ESA requires sampling of soil at representative locations across the site. A NATA accredited laboratory performs the analysis of soil. It is impractical for all of the soil to be assessed. The ESA is often based on a statistical method of grid or random sampling, augmented by targeted sampling at locations known or suspected to be contaminated. Guidance on sampling strategy and density is provided in Australian Standard AS4482.1–2005. However, some considerable degree of judgement is still required in the application of any sampling and testing strategy. For example the blanket application of the "hot spot" method presented in this standard is often inappropriate given its limitations.

The field program also investigates the likelihood of contamination below the site surface. Field investigations must sample and test fill as well as the natural soils. If contamination is found then it is common for further work to be undertaken to characterise, to the extent practical, its vertical and horizontal extent. However, where fill is encountered and testing shows it to be uncontaminated, it must be realised that the heterogeneous nature of the material might mean that not all pockets of contaminated material can be detected using normal sampling regimes.

EPA guidelines for auditors, that may be relevant for an ESA, indicate the need in all cases to consider the potential for groundwater contamination in any site. This does not mean all sites need to be drilled to sample groundwater, but it is most often the case. Most hydrogeological settings and groundwater conditions are complex and vary in space and time. The condition of groundwater is investigated to identify if any beneficial use or environmental value of groundwater is precluded due to contamination.

As previously stated for soil, all groundwater at the site cannot be tested. The environmental investigations are conducted in accordance with industry standards and guidelines (e.g. EPA Vic Pub 668). This provides a level of confidence that a sufficiently comprehensive assessment of the groundwater at the site is achieved.

Where an investigation shows that groundwater is polluted, consideration should be given to assessing the risks and the need for and practicality of any clean up.

4. Environmental Assessment Report

The ESA Report details the findings of the ESA. It provides summary information on the site definition, the reasons for the assessment and other relevant facts. It reviews the scope and quality of the site investigations, laboratory testing and data analyses undertaken. These reports also present a review of the contamination status of the site, the need for any further clean up, and an opinion on the suitability of the site for a range of beneficial uses and land uses such as “residential – low density”, “commercial” etc, as appropriate.

However, as noted above, some ESA have a narrow scope such as for classification of waste soil for removal from site, and do not make conclusions on suitability of site for use.

The ESA Report generally includes copies of other documents and reports, necessary to support the assessment findings, presented as appendices. These can contain more detailed information than the body of the ESA Report. Care should be taken to also read the appended documents and the ESA report in full.

Cardno generally issues reports in electronic form (e-Report) on CD ROM. ESA Reports are issued in this format as Adobe Acrobat™ PDF files. However, a paper copy of the executive summary of the ESA Report is generally issued to the client, and others as required by the brief or by regulation.

5. Limitations of Environmental Assessment Report

The ESA Report is prepared in a manner that can be easily read by a lay person with a legitimate interest in the contamination status of the site, such as the site owner or occupier, EPA and Local Planning Authority. The ESA report is not intended for use by other parties or for other purposes. Anyone who uses the assessment report for purposes other than specified in the report, does so at their own risk.

The site should only be used for one or more of the beneficial uses and land uses identified in the ESA as suitable.

The conditions and qualifications may apply to the suitability of the site for use, and it is the responsibility of the Client to be cognizant of and accept these in accepting the report. Cardno are only responsible for the issuing of the ESA report but accepts no liability for the costs incurred in the implementation of ESA findings.

The ESA provides a “snapshot” of the site conditions at the time of the site investigation. Consequently, the report may not be valid at a later time if there has been any change to the contamination status of the site in that time. Verification of the status of the site may be required in cases where a significant time has elapsed, or site conditions have changed since the assessment and audit.

The ESA is necessarily limited by constraints such as time, cost and available information; although normal professional practice at the time has been applied with all due care to prepare the report. A necessary requirement of this process is the horizontal and vertical interpolation of data from discrete locations. However, site conditions are generally not homogenous and some discrepancies will occur between the actual and predicted results at locations not directly sampled. There is a risk that contamination may occur at the site and not be identified by a competent investigation and assessment. The approach adopted in sampling (a combination of statistically based grid and judgmental sampling) seeks to reduce, but cannot eliminate, this risk.

Where unexpected occurrences of contamination arise, subsequent to the issue of the ESA Report, Cardno should be permitted to make an interpretation of these facts in relation to the ESA Report findings. Consequently, the Client should inform Cardno and seek their opinion. Cardno accepts no liability for costs incurred due to such

unexpected occurrences, given the inherent uncertainties in the assessment process.

Cardno uses information provided by other parties as the basis for the ESA, and reliance on this information is at the discretion of Cardno. However, however Cardno cannot guarantee any of the facts, findings or conclusions presented by other parties. Cardno will not be liable for the use of information, provided by others that is subsequently found to be intentionally misleading.

The ESA Report is not and does not purport to be anything other than a contaminated land ESA. It is not a geotechnical report and bore logs reproduced are for interpretation of the likely distribution of contamination. They are not intended for geotechnical interpretations and may not be adequate for this purpose.

The ESA Report is not intended to be a comprehensive analysis of the presence and associated risk of asbestos in buildings and services. Where asbestos in buildings and services is known or likely, the report may only caution that an appropriately qualified person be engaged to undertake demolition to avoid contamination of the site.

mBGL	Metres Below Ground Level
mbTOC	Metres below Top of Casing
mg/kg	Milligram per Kilogram (approximately equivalent to ppm)
mg/L	Milligram per Litre
ppm	Parts per Million
µg/L	Micrograms per Litre
µS/cm	Micro Siemens per Centimetre (Electrical Conductivity - Water)

Site Specific

OMP	Ongoing Monitoring Plan
DCMM	Defence Contamination Management Manual
ESdat	Environmental data management software

1 Introduction

1.1 Background

Cardno was engaged by the Department of Defence ("Defence" or "the Client") to carry out the Per- and Poly-Fluoroalkyl Substances (PFAS) Ongoing Monitoring Plan (OMP) at Bandiana Military Area ("the Site"). The Bandiana Military Area (BMA) is comprised of three individual properties identified as North Bandiana (Gaza Ridge Barracks), South Bandiana (Gaza Ridge Barracks) and East Bandiana (Wadsworth Barracks).

The OMP was carried out in general accordance with the scope and limitations presented in Cardno's Sampling and Analysis Quality Plan (SAQP):

> Cardno, 13 May 2022. Reference: DEF19008_OMP002, '*PFAS Ongoing Monitoring Plan Sampling and Analysis Quality Plan (SAQP) Bandiana Military Area'*, Rev 1.2.

For the purposes of this report:

> The "On-Site Monitoring Area" (the 'Site') is defined as BMA and is comprised of three individual properties identified as North Bandiana (Gaza Ridge Barracks), South Bandiana (Gaza Ridge Barracks) and East Bandiana (Wadsworth Barracks).

> The "Off-Site Monitoring Area" is defined as comprising Jack in the Box Creek to the north west of South Bandiana to its confluence with Wodonga Creek, an unnamed creek to the east of North Bandiana to its confluence with the Kiewa River, and the Kiewa River and western Kiewa River floodplain from Middle Creek in the south to north of the unnamed creek.

> The "Management Area" (MA) is defined as comprising the On-Site Monitoring Area and the Off-Site Monitoring Area.

The location of the Site (BMA), MA, the On-Site Monitoring Area and the Off-Site Monitoring Area are displayed in Figure 1 of Appendix A.

1.2 Purpose & Objectives

The objective of the OMP is to assess the changes in the nature and extent of PFAS within the environment, specifically where there is an identified potentially elevated risk to a receptor or a potential future risk to a receptor associated with Defence's historical use of Aqueous Film Forming Foam (AFFF).

The purpose of this PFAS OMP factual report is to provide an up-to-date status of the condition of the Site as it is currently understood in relation to the most recent sampling event.

The objectives of the report are:

> To provide a succinct summary of the May 2022 sampling event and provision of analytical results with supporting tables and figures.

> To provide confirmation of the current understanding of risk.

> To provide supporting data for the assessment of management actions, where relevant.

1.3 Relevant Guidelines

This assessment has been undertaken in general accordance with applicable industry standards for a site investigation for the purpose, objectives and scope identified in this report. These standards are set out in:

> Australian and New Zealand Guidelines, 2018, *Australian and New Zealand Guidelines for Fresh and Marine Water Quality.*

> Australian Standard AS 4482-2005 *Guide to the investigation and sampling of sites with potentially contaminated soils, Part 1 - Non-volatile and semi-volatile compounds*.

> Department of Defence, Department of Energy, 2018, *Quality System Manual Schedule B15*.

> Heads of Environmental Protection Authority's Australia and New Zealand (HEPA), 2020, *PFAS National Environmental Management Plan (NEMP),* Version 2.0, January 2020.

> National Environment Protection Council (NEPC), 1999, *National Environmental Protection (Assessment of Site Contamination) Measure (as amended 2013)* (ASC NEPM).

> National Health and Medical Research Council (NHMRC), 2019, *Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water*.

> Standards Australia, 1998, AS/NZ 5667:1998 *Water quality – sampling*.

> U.S. Environmental Protection Agency (EPA), 2000, '*Guidance for the Data Quality Objectives Process (EPA QA/G-4)*'.

> USEPA, 2002, '*Guidance on Environmental Data Verification and Data Validation (EPA QA/G-8)'.*

2 Scope of Work

Cardno carried out the following tasks in order to satisfy the purpose and objectives of this assessment.

2.1 Review / Revision of the SAQP

Cardno undertook a review of the SAQP (Rev1.2; Cardno, 2022) prior to commencement of sampling and updated four annual groundwater sampling locations to biannual sampling frequency following the significant increases in PFAS concentration identified in two on-Site wells during the November/December 2021 event. The SAQP will be reviewed and further revised as required prior to the next monitoring event scheduled for October/November 2022.

2.2 Groundwater Monitoring

Sampling of selected groundwater monitoring wells was performed in general accordance with the SAQP, applying methods set out in Section 3 of this report. The groundwater monitoring wells monitored as part of the OMP May 2022 biannual sampling event are presented in Table 2-1, and are shown in Figure 3, Appendix A.

Table 2-1 Groundwater Monitoring Locations

Catchment	Sampling Frequency	Location (On-Site/ Off-Site)	Monitoring Well / Bore ID
Jack In the Box Creek	Biannual	On-Site	MW304, MW307, MW312.
		Off-Site	MW360, MW361.
Kiewa River	Biannual	On-Site	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_I, MW046_D, MW052, MW342, MW345, MW346, MW350_S, MW350_D, MW351, MW352, MW353, MW354, MW403 and MW404.
		Off-Site	MW356, MW357, OTH019.

2.3 Surface Water Monitoring

The surface water sampling locations monitored as part of the OMP May 2022 biannual sampling event are presented in Table 2-2, and are shown in Figure 4, Appendix A.

Table 2-2 Surface Water Monitoring Locations

Catchment	Sampling Frequency	Location (On-Site/ Off-Site)	Monitoring Location ID
Jack In the Box Creek	Biannual	On-Site	SW302, SW307, SW310, SW311, SW313, SW316, SW321, SW322, SW323, SW324, SW326, SW332, SW333, SW336, SW338, and SW448.
		Off-Site	SW424, SW427, SW430, SW431, SW432, SW434 and SW463.
Kiewa River	Biannual	On-Site	SW340, SW346, SW349, SW355, SW370, SW374, SW375, SW379, SW380, SW382, SW387 and SW388.

Catchment	Sampling Frequency	Location (On-Site/ Off-Site)	Monitoring Location ID
		Off-Site	SW390, SW393, SW395, SW396, SW397, SW398, SW400, SW401, SW403, SW404, SW405, SW409, SW412, SW416, SW462, SW470, SW471 and SW487.

2.4 Sediment Monitoring

The sediment sampling locations monitored as part of the OMP May 2022 biannual sampling event are presented in Table 2-3, and are shown in Figure 5, Appendix A.

Table 2-3 Sediment Monitoring Locations and Frequency

Catchment	Sampling Frequency	Location (On-Site/ Off-Site)	Monitoring Location ID
Jack in the Box Creek	Annual (February to May)	On-Site	SD323.
		Off-Site	SD424 and SD463.
Kiewa River	Annual (February to May)	On-Site	SD346, SD355, SD375 and SD382.
		Off-Site	SD395, SD396, SD397, SD400 and SD412.

2.5 Data Management

All the data included in the report have been collected, uploaded to the ESdat database and reviewed according to the data management requirements of the Defence Contamination Management Manual (DCMM) Annex L.

2.6 Deviations from the OMP SAQP

Deviations from the SAQP were attributed to a lack of sampling media or access constraints, as summarised in Table 2-4. On-Site and off-Site sampling and testing was undertaken at 32 groundwater monitoring wells and 12 sediment sampling locations. On-Site and off-Site sampling and testing was planned at 53 surface water locations but was only completed at 43 surface water locations. Further details of why sampling could not be completed at some locations are provided in Table 2-4..

Table 2-4 Deviations from the SAQP

Location	Deviation	Comment/Justification	Impact on Existing Dataset
Groundwater			
OTH019	Alternate sampling method	No monitoring well access, sample collected from tap following purging of bore by way of running tap for 1 minute.	No impact – sample method has been consistent throughout OMP.
Surface Water			
SW302	Not Sampled	Location dry	Data gap- This is considered to have minor impact on the monitoring program as the downstream locations were also dry during this sampling event. The location was not sampled in the previous event November 2021 as it was dry.
SW307	Not Sampled	Location dry	Data gap- This is considered to have minor impact on the monitoring program as location last sampled in the November 2021 sampling event where a first-time detection and new exceedance of drinking water criteria was reported for PFOS+PFHxS. Downstream locations have been sampled in this event, noting that downstream locations are off-Site.
SW310	Not Sampled	Location dry	Data gap- This is considered to have minor impact on the monitoring program as the location last sampled in the November 2021 sampling event where a first-time detection and new exceedance of drinking water criteria was reported for PFOS+PFHxS. Downstream locations have been sampled in this event, noting that downstream locations are off-Site.
SW311	Not Sampled	Location dry	Data gap- This is considered to have minor impact on the monitoring program as the location last sampled in the November 2021 sampling event where a first-time detection of PFOA and PFOS+PFHxS and a new exceedance of drinking water criteria was reported for PFOS+PFHxS. Downstream locations have been sampled in this event, noting that downstream locations are off-Site.
SW313	Not Sampled	Location dry	Data gap- This is considered to have minor impact on the monitoring program as the location last sampled in the November 2021 sampling event where a first-time detection of PFOA and PFOS+PFHxS and a new exceedance of drinking water criteria was reported for PFOS+PFHxS. Downstream locations have been sampled in this event, noting that downstream locations are off-Site.
SW332	Not Sampled	Location dry	Data gap- This is considered to have minor impact on the monitoring program as the location last sampled in the November 2021 sampling event where results were above the laboratory limit of reporting (LOR), but below adopted drinking water criteria for PFOS+PFHxS. Downstream locations have been sampled in this event.
SW340	Not Sampled	Location dry	Data gap- This is considered to have minor impact on the monitoring program as the location last sampled in the November 2021 sampling event where results were above the adopted drinking water criteria for PFOS+PFHxS and PFOA, consistent with 2017 concentrations. Downstream locations have been sampled in this event, noting that downstream locations are off-Site.
SW379	Not Sampled	Location dry	Data gap- This is considered to have minor impact on the monitoring program as the location last sampled

Location	Deviation	Comment/Justification	Impact on Existing Dataset
			in the November 2021 sampling event where a first-time detection of PFOA and PFOS+PFHxS and a new exceedance of drinking water criteria was reported for PFOS+PFHxS. No downstream locations present in OMP.
SW380	Not Sampled	Location dry	Data gap- This is considered to have minor impact on the monitoring program as the location last sampled in the November 2021 sampling event where a first-time detection and new exceedance of adopted drinking water criteria was reported for PFOS+PFHxS. Downstream location (SW379) not sampled this event.
SW448	Not Sampled	Location dry	Data gap- This is considered to have minor impact on the monitoring program as the location was last sampled in the November 2021 sampling event where results were reported above the LOR for PFOA and PFOS+PFHxS and above the adopted drinking water criteria for PFOS+PFHxS and PFOA. Downstream locations have been sampled in this event.

3 Methodology

3.1 Groundwater Sampling Methodology

Groundwater monitoring was undertaken as detailed in Table 3-1.

Table 3-1 Groundwater Sampling Method

Activity	Details
Dates of Field Activity	2 to 9 May 2022
Well Gauging	Standing Water Levels (SWL) were gauged using an interface probe. All wells were measured against a specified mark at the top of the well casing.
Groundwater Field Parameters	Groundwater water quality parameter field measurements (field parameters) were recorded with a water quality meter before sample collection (with the sample in a clean jar). The following field parameters were recorded using a water quality meter: ▪ pH. ▪ Electrical conductivity (EC). ▪ Oxidation reduction potential (ORP). ▪ Dissolved oxygen (DO). ▪ Temperature. Field parameters measured by the water quality meter were recorded on field data records. All field instruments (e.g. water quality meter) were calibrated by the equipment supplier to optimise the accuracy of the measurements taken. Bump tests were also completed daily by field staff during the monitoring event. Calibration certificates and bump test records are provided in Appendix D.
Deployment of HydraSleeve	The HydraSleeves® were deployed with attached weights in order for sample collection to begin at the lowest point of the well screen. New HydraSleeves® were deployed following the gauging of all wells in the OMP in November 2021. Any HydraSleeves® that are found to be worn or damaged are replaced with a new HydraSleeve®.

Activity	Details
Retrieval of HydraSleeves (Sample Collection)	At the majority of locations, HydraSleeve® sampling devices were left in wells from the previous sampling event, ensuring the wells were restabilised following the slight disturbance caused by sampler deployment. Where only bottom-weights were used, HydraSleeves® were left in wells for a minimum of four hours to allow restabilisation of the well following the slight disturbance caused by sampler deployment. Where both top and bottom-weights were used, HydraSleeves® were left in wells for a minimum of 24 hours to allow proper compression of the HydraSleeve® and restabilisation of the well following the slight disturbance caused by sampler deployment. Samples were collected via continuous pull method at a rate allowing the water to pass through the check valve into the sample sleeve. Samples were discharged immediately (to minimise changes in chemistry) via a discharge tube. The same HydraSleeves® were redeployed after sampling in preparation for the next sampling event.
Sample collection by bailer or tap	As per the SAQP, where insufficient water is retrieved with the HydraSleeve®, samples will be collected by bailer. For bailer sampling, wells will be purged three bore volumes, or until dry, whichever is sooner, prior to sample collection. Where sampling of a well is required from a tap due to access constraints, the well will be purged by running water for one minute prior to sample collection.
Decontamination procedure	Dedicated HydraSleeves® were used at each groundwater monitoring well, thus removing the need for decontamination. Where HydraSleeves® could not be used, dedicated bailers were used instead which also did not require decontamination. All re-usable sampling equipment was thoroughly washed using PFAS & phosphate-free detergent, then double rinsed with clean water before the sample collection.
Sample identification, preservation transport and holding times	Each sample was labelled with the sample location, date, project identification number and sampler's initials. Samples were collected directly into appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under Chain of Custody (CoC) documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998 and AS 4482.1 as appropriate).
Laboratory Testing	All groundwater samples were analysed for the full PFAS analytical suite (see SAQP for full list of analytes). The primary laboratory was ALS Global Laboratories (Springvale), and the secondary laboratory (quality control) was Eurofins (Dandenong South). Both laboratories are NATA-accredited for the parameters tested. Copies of the NATA stamped laboratory reports and Chain of Custody documentation are included in Appendix C.
Laboratory Testing – Quality Control	Groundwater quality control samples were collected as follows and analysed for the full PFAS analytical suite: ▪ Field duplicate (intra-laboratory) samples at one per 10 water samples (three samples). ▪ Field triplicate (inter-laboratory) samples at one per 10 water samples (three samples). ▪ Rinsate blank samples at one per day [collected off re-used sampling equipment (e.g. interface probe)] (six samples total). ▪ Trip blank samples of one per shipment included in the chilled sample containers upon transport to the laboratory (one sample total).

3.2 Surface Water Sampling Methodology

Surface water monitoring was undertaken using a grab method as detailed in Table 3-2.

Table 3-2 Surface Water Sampling Method

Item	Details
Dates of Field Activity	2 to 9 May 2022
Field parameters	Surface water field parameters (i.e. pH, EC, ORP, DO, and temperature) were recorded at the time of sampling using a pre-calibrated water quality meter. Field observations such as odours and flow were also recorded on field sampling sheets.
Sampling Method	Where possible, the samples were collected directly into sample containers. Where depth permits, sample bottles were positioned at least 10 cm below the surface water level and above the sediment bed and orientated with the opening facing downwards to avoid the collection of surface films. Where access to surface water is difficult, the sample is collected by attaching the sample bottles to a long-handled sampling device (telescopic pole) which are directly filled by lowering the sample bottle into the surface water body. The sample bottles are attached so that the telescopic pole is not in direct contact with the opening of the sample bottle. Samples were collected in accordance with Australian/New Zealand Standards (AS/NZS 5667.1:1998) '*Water quality – Sampling – Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples'*.
Decontamination	All re-usable sampling equipment (e.g. telescopic pole) were thoroughly washed using phosphate-free detergent (Liquinox), and subsequently double rinsed with de-ionised water before the sample collection.
Sample identification, preservation, transport and holding times.	Each sample was labelled with the sample location, date, project identification number and sampler's initials. Sample labelling and naming was in accordance with Annex L of the DCMM. Samples were contained in appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under Chain of Custody (COC) documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998 and AS 4482.1 as appropriate).
Laboratory Testing	All surface water samples were analysed for the full PFAS analytical suite (see SAQP for full list of analytes). The primary laboratory was ALS Global Laboratories (Springvale), and the secondary laboratory (quality control) was Eurofins (Dandenong South). Both laboratories are NATA-accredited for the parameters tested. Copies of the NATA stamped laboratory reports and Chain of Custody documentation are included in Appendix C.
Laboratory Testing – Quality Control	Surface water quality control samples were collected as follows and analysed for the full PFAS analytical suite: ▪ Field duplicate (intra-laboratory) samples at one per 10 water samples (four samples). ▪ Field triplicate (inter-laboratory) samples at one per 10 water samples (four samples). ▪ Rinsate blank samples at one per day [collected off re-used sampling equipment (e.g. telescopic pole)] (six samples total). ▪ Trip blank samples of one per shipment included in the chilled sample containers upon transport to the laboratory (one sample total).

3.3 Sediment Sampling Methodology

Table 3-3 Sediment Sampling Method

Item	Details
Dates of Field Activity	2 to 9 May 2022
Sample Collection	Sediment samples were collected at the sediment/water interface using the required hand tools (e.g. trowel), with samples placed directly into appropriately labelled, laboratory supplied sample

	containers and packed in chilled containers for delivery to the laboratory under Chain of Custody documentation. At each sampling location, the sediment sample was visually assessed and observations (including physical description) recorded on field data sheets.
Decontamination	All re-usable sampling equipment (e.g. trowel) were thoroughly washed using phosphate-free detergent (Liquinox), and subsequently double rinsed with clean water before the sample collection.
Sample identification, preservation, transport and holding times.	Each sample was labelled with the sample location, date, project identification number and sampler's initials. Sample labelling and naming was in accordance with Annex L of the DCMM. Samples were contained in appropriately preserved laboratory supplied bottles (Teflon-free) and packed in chilled containers for delivery to the laboratory under Chain of Custody (COC) documentation. Sample containers, preservation procedures, sample storage requirements and holding times were undertaken in accordance with those recommended by Standards Australia (AS/NZS 5667.1:1998 and AS 4482.1 as appropriate).
Laboratory Testing	All sediment samples were analysed for the full PFAS analytical suite (see SAQP for full list of analytes). The primary laboratory was ALS Global Laboratories (Springvale), and the secondary laboratory (quality control) was Eurofins (Dandenong South). Both laboratories are NATA-accredited for the parameters tested. Copies of the NATA stamped laboratory reports and Chain of Custody documentation are included in Appendix C.
Laboratory Testing – Quality Control	Sediment quality control samples were collected as follows and analysed for the full PFAS analytical suite: ▪ Field duplicate (intra-laboratory) samples at one per 10 sediment samples (two samples). ▪ Field triplicate (inter-laboratory) samples at one per 10 sediment samples (two samples). ▪ Rinsate blank samples at one per day [collected off re-used sampling equipment (e.g. trowel)] (six samples total). ▪ Trip blank samples of one per shipment included in the chilled sample containers upon transport to the laboratory (one sample total).

3.4 Quality Control / Quality Assurance

A critical aspect of site assessments is the demonstration of the quality of the data used as the basis for the assessment. This is achieved through a Data Validation process which includes a review of the following data quality indicators, as described in the SAQP:

- QA documentation.
- Bias.
- Data Representativeness.
- Data Precision & Accuracy.
- Data Comparability.
- Data Set Completeness.

A detailed review of these aspects has been undertaken, the results of which are presented in Appendix E. A summary of the data validation from the QA/QC review is included in Section 4.5 below.

3.5 Assessment Criteria

3.5.1 Groundwater and Surface Water

The adopted assessment criteria for groundwater and surface water are detailed in Table 3-4.

Table 3-4 Criteria for Groundwater and Surface Water

Exposure Scenario	Adopted Assessment Criteria		Guidance
	PFHxS / PFOS	PFOA	
	µg/L		

Human Health - Surface Water Recreational	2[2]	10	PFAS NEMP (HEPA, 2020)
Human Health - Drinking Water Quality Guideline[1]	0.07[2]	0.56	PFAS NEMP (HEPA, 2020)
Ecological (99% species protection – high conservation value systems)	0.00023[3,4]	19	PFAS NEMP (HEPA, 2020)
Ecological (95% species protection – slightly to moderately disturbed systems)	0.13[3]	220	PFAS NEMP (HEPA, 2020)

1. Drinking Water screening guidelines have been adopted for screening purposes for Industrial Water use, Stock Water use and Agriculture/Parks/Gardens Water use.
2. Combined PFOS and PFHxS.
3. PFOS only.
4. The criterion of 0.00023 µg/L is lower than the laboratory LOR, however, the PFAS NEMP (HEPA, 2020) allows for the adoption of the laboratory LOR as a screening level rather than a quantified measurement.

3.5.2 Sediment

No national assessment criteria have been established.

4 Field Observations and Results

4.1 Conditions Impacting the Sampling Event

In the seven days prior to the sampling event (2 to 9 May 2022), 9.6 mm of rain was recorded at the nearest weather station (082056), located in Wodonga. During the sampling event (2 to 9 May 2022), 1.0 mm of rain was recorded at weather station 082056. The total rainfall observed in May 2022 (40 mm) was slightly lower than the historical average of 45.6 mm (2020 to 2022). Sampling of surface water following a reasonable rain event (35mm over four days) is preferable as locations may have insufficient volume for sampling, however due to the limited rainfall in May 2022, no reasonable rain events were identified within the weeks preceding or following the May 2022 sampling event. This likely resulted in additional locations being observed as dry during the event, comparative to the November 2022 event.

No on-site activities with the potential to impact sample collection or the results were noted.

4.2 Groundwater

4.2.1 Summary of Field Observations

4.2.1.1 Water quality parameter field measurements

Stabilised water quality parameter field measurements, water colour and turbidity observations recorded during the groundwater sampling program are presented in field sampling record sheets, included in Appendix D. Groundwater varied from clear to brown with low to medium turbidity and no notable changes were recorded relative to the November 2021 sampling event observations.

4.2.1.2 Groundwater Elevation and Migration

Groundwater elevation and flow direction across the three bases included in the PFAS OMP is summarised below:

- South Bandiana: Groundwater elevations observed at South Bandiana during the sampling event ranged from 160.115 mAHD at MW304 to 166.352 mAHD at MW329. Slight groundwater mounding was observed at MW329. Well MW326 was damaged due to impact, and is presumed to be blocked which has prevented the measurement of water level. Groundwater flow is inferred to flow in a north-westerly direction toward the Jack in the Box Creek. Groundwater elevations and flow direction were generally consistent with those reported during the previous sampling event.
- North Bandiana: Groundwater elevations observed at North Bandiana during the sampling event ranged from 163.334 mAHD at MW345 to 165.698 mAHD at MW342. Groundwater flow is inferred to flow in an easterly direction toward the Kiewa River. Groundwater elevations and flow direction were generally consistent with those reported during the previous sampling event.

> East Bandiana: Groundwater elevations observed at East Bandiana during the sampling event ranged from 158.850 mAHD at MW018 to 160.606 mAHD at MW052. Groundwater flow is inferred to flow in an easterly direction toward the Kiewa River. Groundwater elevations and flow direction were generally consistent with those reported during the previous sampling event.

Groundwater elevation contours and flow directions for May 2022 are shown in Figure 2, Appendix A. Gauging data are presented in Appendix D.

4.2.2 Groundwater Laboratory Results

The results of laboratory analysis have been compared against adopted assessment criteria, and are presented in Table B1, Appendix B, and summarised in Table 4-1 below. Of the 32 primary samples that were tested, PFOA was reported above the LOR in 19 samples, and Sum of PFHxS and PFOS in 31 samples.

Table 4-1 Summary of Groundwater Results Exceeding Adopted Criteria

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR	No. Results Above Criteria	Significant Concentration Changes[3]
PFOS	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_D, MW046_I, MW052, MW304, MW307, MW342, MW345, MW350_D, MW350_S, MW351, MW352, MW353, MW354, MW357, MW360, MW361, MW403, MW404, OTH019	0.00023[2]	88.8	29	29	None
PFOA	MW035, MW042, MW043, MW052, MW307, MW350_S, MW403, MW404	0.56[1]	49.4	19	8	None
Sum of PFHxS and PFOS	MW009, MW012, MW016, MW018, MW020, MW029, MW034, MW035, MW042, MW043, MW046_D, MW046_I, MW052, MW304, MW307, MW312, MW342, MW345, MW350_D, MW350_S, MW353, MW354, MW360, MW361, MW403, MW404, OTH019	0.07[1]	644	31	27	None

Note:
1. Drinking water assessment criteria
2. Ecological assessment criteria
3. Significant concentration change defined as an order of magnitude increase or decrease

Results have also been compared to available historical data. All concentrations reported during this event were generally consistent with previous sampling events.

A summary of locations where a first-time detection, or a new exceedance of guideline values, of PFOS, Sum of PFHxS and PFOS, or PFOA, were reported is provided in Table 4-2 below. The laboratory reports are provided in Appendix C.

Table 4-2 Summary of Groundwater Results with First-time Detections or New Exceedances of Adopted Criteria

Deviation Type	Monitoring Well	Sum of PFHxS + PFOS concentration (µg/L)		PFOA concentration (µg/L)		PFOS concentration (µg/L)	
		May 2022	Previous Maximum	May 2022	Previous Maximum	May 2022	Previous Maximum

New exceedance of the NEMP (HEPA, 2020) drinking water guidelines	MW035	**12.4**	**12.1**	**0.59**	**0.54**	**5.07**	**3.97**
	MW304	**0.16**[1]	0.02	<0.02	<0.01	**0.1**[1]	**0.02**

Note:
Location with first-time detection of PFOS + PFHxS, PFOA or PFOS in latest monitoring round
Location with a new exceedance of lowest adopted guideline values in latest monitoring round
Bold: Exceedance of lowest adopted guideline values
1. Result recorded on quality control (duplicate or split) sample

Findings are summarised as follows:

- One groundwater sampling location (MW304) reported a new exceedance of the Drinking Water criteria of Sum of PFHxS and PFOS.
- One groundwater sampling location (MW035) reported a new exceedance of the Drinking Water criteria of PFOA.
- No groundwater sampling locations reported a first-time detection of Sum of PFHxS and PFOS, PFOS or PFOA.

4.3 Surface water

4.3.1 Summary of Field Observations

4.3.1.1 Water quality parameter field measurements

Stabilised water quality parameter field measurements, water colour and turbidity observations recorded during the surface water sampling program are presented in field sampling record sheets, included in Appendix D. Surface water varied from cloudy to brown with low to high turbidity and flow rate ranged from low to medium. Flow rates were generally lower than those observed in November 2022.

As noted in Section 4.1, during the May 2022 sampling event a number of on-Site locations were unable to be sampled as they were dry during the event, due to the lack of rainfall prior to and during the event as compared to the previous sampling in November 2022.

4.3.2 Surface Water Laboratory Results

The results of laboratory analysis have been compared against adopted assessment criteria, presented in Table B2, Appendix B, and summarised in Table 4-3 below. Of the 43 primary samples that were tested, PFOA was reported above the LOR in 19 samples, and Sum of PFHxS and PFOS in 36 samples.

Table 4-3 Summary of Surface Water Results Exceeding Adopted Criteria

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR	No. Results Above Criteria	Significant Concentration Changes[3]
PFOS	SW316, SW321, SW322, SW323, SW324, SW326, SW333, SW336, SW338, SW346, SW349, SW355, SW370, SW374, SW375, SW387, SW388, SW395, SW396, SW397, SW400, SW401, SW403, SW405, SW409, SW412, SW424, SW427, SW431, SW432, SW434, SW462, SW463, SW470, SW471, SW487	0.00023[2]	7.64	36	36	SW326, SW430 (decrease)
PFOA	-	0.56[1]	0.35	19	0	SW326 (decrease)

Analytes	Locations Exceeding Criteria	Lowest Criteria (µg/L)	Max Conc. (µg/L)	No. Analytical Results >LOR	No. Results Above Criteria	Significant Concentration Changes[3]
Sum of PFHxS and PFOS	SW316, SW321, SW322, SW323, SW324, SW326, SW333, SW336, SW338, SW346, SW349, SW355, SW370, SW375, SW387, SW388, SW395, SW396, SW397, SW400, SW401, SW403, SW405, SW412, SW424, SW463, SW470, SW471, SW487	0.07[1]	8.31	36	29	SW326, SW430 (decrease)

Note:
1. Drinking water assessment criteria.
2. Ecological assessment criteria.
3. Significant concentration change defined as an order of magnitude increase or decrease.

Results have also been compared to available historical data. The following locations have reported a significant change in concentration for this monitoring event:

- SW326: Sum of PFHxS and PFOS has decreased by one order of magnitude from 10.1 µg/L in November 2021 to 0.69 µg/L in this event. PFOA has also decreased by one order of magnitude from 0.38 µg/L in November 2021 to 0.01 µg/L in this event.
- SW430: Sum of PFHxS and PFOS has decreased by one of magnitude from 0.16 µg/L in November 2021 to below LOR in this event.

All other concentrations reported during this event were generally consistent with previous sampling events.

No surface water sampling locations reported a first-time detection or new exceedance of Sum of PFHxS and PFOS or PFOA.

4.4 Sediment

4.4.1 Summary of Field Observations

Odour, colour and other observations recorded during the sediment sampling program are presented in field sampling record sheets, included in Appendix D.

4.4.2 Laboratory Results

National assessment criteria have not been established for PFAS in sediment. The results of laboratory analysis have been compared against historical results, presented in Table B3, Appendix B and summarised below.

Of the 12 primary samples analysed, one sample reported PFOA concentrations above the LOR, and 11 samples reported Sum of PFHxS and PFOS concentrations above the LOR.

Results have also been compared to available historical data. The following locations have reported a significant change in concentration for this monitoring event:

- SD355: Sum of PFHxS and PFOS has decreased by one order of magnitude from a previous result of 0.0128 mg/kg in October 2017 to 0.001 mg/kg in this event.

4.5 Data Validation

The data validation process has concluded that there are no significant systematic errors in the data collection process. Therefore, the data set used as the basis for the sediment, surface water and groundwater assessment are considered valid and complete. A detailed Data Quality Review is included in Appendix E.

5 Summary and Conclusions

Cardno conducted the May 2022 biannual groundwater, surface water and sediment monitoring event at BMA as part of the PFAS OMP. On-site and off-site sampling and testing was undertaken at 32 groundwater monitoring wells, 43 surface water locations and 12 sediment sampling locations.

Groundwater levels were gauged in all accessible wells before sampling. Groundwater flow was interpreted be consistent with the November 2021 to flow in a south-westerly direction from South Bandiana towards Jack in the Box Creek, easterly direction from North Bandiana and East Bandiana towards the Kiewa River.

Table 5-1 Summary of Results

Activity	Details
Deviations from OMP SAQP	> One groundwater well was sampled from a tap connected to the pump in the well due to there being no direct monitoring well access. > 10 surface water sampling locations were not sampled due to the locations being dry.
Groundwater Analytical Results	> 32 groundwater samples were collected in total. > No samples reported a first-time detection of Sum of PFHxS and PFOS or PFOA. > One sample reported a new exceedance of the Drinking Water assessment criteria for PFOA. > One sample reported a new exceedance of Drinking Water assessment criteria for Sum of PFHxS and PFOS. > All groundwater results were generally consistent with the previous monitoring event.
Surface Water Analytical Results	> 43 surface water samples were collected in total. > No samples reported a first-time detection and/or new exceedance of the adopted ecological and drinking water criteria. > Two surface water samples reported an order of magnitude decrease for PFOS and Sum of PFHxS and PFOS compared to the previous event. > One surface water sample reported an order of magnitude decrease for PFOA compared to the previous event. > All other concentrations reported during this event were generally consistent with previous sampling events.
Sediment Analytical Results	> 12 sediment samples were collected in total. > No samples reported first-time detections of Sum of PFHxS and PFOS or PFOA. > One sediment sample reported an order of magnitude decrease for Sum of PFHxS and PFOS compared to previous event.
Next Scheduled Monitoring Event	> The next OMP monitoring event is scheduled for October/November 2022. > SAQP to be reviewed and updated as required prior to the next monitoring event.

Notes

Denotes first time detection above LOR in latest monitoring round

Denotes new exceedance of human health screening criteria in latest monitoring round

Data Comments

#1 Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.

#2 Reported Analyte LOR is higher than Requested Analyte LOR

Notes

Denotes first time detection above LOR in latest monitoring round

Denotes new exceedance of human health screening criteria in latest monitoring round

Data Comments

#1 Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding lir

#2 Reported Analyte LOR is higher than Requested Analyte LOR

Notes

Denotes first time detection above LOR in latest monitoring round

Denotes new exceedance of human health screening criteria in latest monitoring round

Data Comments

#1 Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/branched standard.

#2 Reported Analyte LOR is higher than Requested Analyte LOR

Notes

Denotes first time detection above LOR in latest monitoring round

Denotes new exceedance of human health screening criteria in latest monitoring round

Data Comments

#1 Quantification of linear and branched isomers has been conducted as a single total response using the relative response factor for the corresponding linear/b

#2 Reported Analyte LOR is higher than Requested Analyte LOR

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 30 (1-10 x EQL); 30 (10-30 x EQL); 30 (> 30 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

*RPDs have only been considered where a concentration is greater than 1 times the EQL.
**High RPDs are in bold (Acceptable RPDs for each EQL multiplier range are: 30 (1-10 x EQL); 30 (10-30 x EQL); 30 (> 30 x EQL))
***Interlab Duplicates are matched on a per compound basis as methods vary between laboratories. Any methods in the row header relate to those used in the primary laboratory

Dates

Date Samples Received	: 25-May-2022 10:15	Issue Date	: 27-May-2022
Client Requested Due Date	: 01-Jun-2022	Scheduled Reporting Date	: **01-Jun-2022**

Delivery Details

Mode of Delivery	: Carrier	Security Seal	: Not Available
No. of coolers/boxes	: 1	Temperature	: 14.3°C
Receipt Detail	:	No. of samples received / analysed	: 2 / 2

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please direct any queries related to sample condition / numbering / breakages to Client Services.**
- Sample Disposal - Aqueous (3 weeks), Solid (2 months) from receipt of samples.
- **Analytical work for this work order will be conducted at ALS Springvale.**
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **WATER**

Laboratory sample ID	Sampling date / time	Sample ID	WATER - EP231X PFAS - Full Suite (28 analytes)

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

Analytical Results

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

- **No Laboratory Duplicate (DUP) Results are required to be reported.**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

- **No Matrix Spike (MS) or Matrix Spike Duplicate (MSD) Results are required to be reported.**

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2209833**	Page	: 1 of 4
Client	: **JBS&G AUSTRALIA PTY LTD**	Laboratory	: Environmental Division Melbourne
Contact	: [redacted]	Telephone	: [redacted]
Project	: VIC_0445_PFASMGMT_22	Date Samples Received	: 25-May-2022
Site	: ----	Issue Date	: 01-Jun-2022
Sampler	: CM	No. of samples received	: 2
Order number	: 61395	No. of samples analysed	: 2

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type / Method	Count		Rate (%)		Quality Control Specification
	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	16	0.00	10.00	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)					
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	0	16	0.00	5.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
= Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Sub-Matrix: **WATER**

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

ALS Environmental

QA/QC Compliance Assessment to assist with Quality Review

Work Order	: **EM2208348**	Page	: 1 of 4
Client	: **DONT NOT USE - LOG UNDER MWHAUS**	Laboratory	: Environmental Division Melbourne
[redacted]	: [redacted]	Telephone	: [redacted]9
Project	: VIC_0445_PFASOMP	Date Samples Received	: 09-May-2022
Site	: Bandiana P02	Issue Date	: 17-May-2022
Sampler	: [redacted]	No. of samples received	: 1
Order number	: -	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **NO Matrix Spike outliers occur.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.3, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Laboratory Coordinator	[redacted]
[redacted]	Senior Organic Chemist	[redacted]

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X: Samples (EM2208381) required dilution due to matrix interferences. LOR values have been adjusted accordingly.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: Samples EM2208381 required dilution due to matrix interferences. LOR values have been adjusted accordingly.
- Amendment (02/06/2022): This report has been amended as a result of a request to change sample identification numbers (IDs) received from Abe Wright on 01/06/2022, for samples EM2208381 #40,43,44,51. All analysis results are as per the previous report.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.
- EP231X-INJ: The direct injection LCMSMS method may be used where the sample matrix is not suitable for Solid Phase Extraction (e.g. significant particulate load) or where only a single sample container is received.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Summary of Outliers

Outliers : Quality Control Samples

ThlDrehorbhlghQghbDoubQerDf@agge2 li the k uaQt y oi broQk y UHehorb)

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**

Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

T- is rehort suhersedes any hrevious rehort(s) wit- t- is reference. Results ahhly to t- e samhle(s) as submitted, unless t- e samhling was conducted by ALS. T- is document s- all not be rehroduced, exceht in full.

T- is Certificate of Analysis contains t- e following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional infor1 ation pertinent to this report will be found in the following separate attach1 ents: Quality Control Report, QA/QC Co1 pliance Assess1 ent to assist with Quality Review and Sa1 ple ReceiptNotification

Signatories

T- is document - as been electronically signed by t- e aut- orized signatories below. Electronic signing is carried out in comhliance wit- hrocedures shecified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Laboratory Coordinator	[redacted]
[redacted]	Senior Organic C- emist	[redacted]

General Comments

T- e analytical hrocedures used by ALS - ave been develohed from establis- ed internationally recognised hrocedures suc- as t- ose hublis- ed by t- e USEPA, APHA, AS and NEPM. In - ouse develohed hrocedures are fully validated and are often at t- e client request.

W- ere moisture determination - as been herformed, results are rehorted on a dry weig- t basis.

W- ere a rehorted less t- an (<) result is - ig- er t- an t- e LOR, t- is may be due to hrimary samhle extract/digestate dilution and/or insufficient samhle for analysis.

W- ere t- e LOR of a rehorted result differs from standard LOR, t- is may be due to - ig- moisture content, insufficient samhle (reduced weig- t emhloyed) or matrix interference.

W- en samhling time information is not hrovided by t- e client, samhling dates are s- own wit- out a time comhonent. In t- ese instances, t- e time comhonent - as been assumed by t- e laboratory for hrocessing hurhoses.

W- ere a result is required to meet comhliance limits t- e associated uncertainty must be considered. Refer to t- e ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by C- emical Abstracts Services. T- e C- emical Abstracts Service is a division of t- e American C- emical Society.
LOR = Limit of rehorting
^ = T- is result is comhuted from individual analyte detections at or above t- e level of rehorting
ø = ALS is not NATA accredited for t- ese tests.
~ = Indicates an estimated value.

- EP241X: Poor matrix shike recovery for samhle EM2209122-00p due to samhle matrix interference.
- EP241X - Per- and Polyfluoroalkyl Substances (PFAS): Samhles received in 20ml or 125ml bottles - ave been tested in accordance wit- t- e QSM5.4 comhliant, NATA accredited met- od. 80mL or 250mL bottles - ave been tested to t- e legacy QSM 5.1 aligned, NATA accredited met- od.
- Amendment (02/08/2022): T- is rehort - as been amended as a result of a request to c- ange samhle identification numbers (IDs) received from Abe Wrig- t on 01/08/2022, for samhles EM2209492 #7,9,3. All analysis results are as her t- e hrevious rehort.
- EP241: Stable isotohe enric- ed internal standards are added to samhles hrior to extraction. Target comhounds - ave a direct analogous internal standard wit- t- e excehtion of PFPeS, PFHhA, PFDS, PFTrDA and 10:2 FTS. T- ese comhounds use an internal standard t- at is c- emically related and - as a retention time close to t- at of t- e target comhound. T- e DQO for internal standard reshonse is 50-150% of t- at establis- ed at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branc- ed PFOS isomers. T- ese hractices are in line wit- recommendations in t- e National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical prf cedures used by ALS have been develf ped 7rf m established internatif nally recf gnised prf cedures such as thf se published by the USEPA2 APHA2 AS and NEPM. In hf use develf ped prf cedures are 7ully validated and are f 7ten at the client request.

Where mf isture determinatif n has been per7rmed2results are repf rted f n a dry weight basis.

Where a repf rted less than (<) result is higher than the LOR2 this may be due tf primary sample extract/digestate dilutif n and/f r insu7icient sample 7r analysis. Where the LOR f 7 a repf rted result di7ers 7rf m standard LOR2this may be due tf high mf isture cf ntent2insu7icient sample (reduced weight emplf yed) f r matrix inter7erence.

Key : Anf nymf us = Re7ers tf samples which are nf t speci7cally part f 7this wf rk f rder but 7r rmed part f 7the QC prf cess lf t
CAS Number = CAS registry number 7rf m database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a divisif n f 7the American Chemical Sf ciety.
LOR = Limit f 7repf rting
RPD = Relative Percentage Di7erence
= Indicates 7ailed QC

Laboratory Duplicate (DUP) Report

The quality cf ntrf l term Labf ratf ry Duplicate re7ers tf a randf mly selected intralabf ratf ry split. Labf ratf ry duplicates prf vide in7rmatif n regarding methf d precisif n and sample heterf geneity. The permitted ranges 7r the Relative Percent Deviatif n (RPD) f 7 Labf ratf ry Duplicates are speci7ed in ALS Methf d QWI-EN/38 and are dependent f n the magnitude f 7 results in cf mparisf n tf the level f 7 repf rting: Result < o0 times LOR: Nf Limit; Result between o0 and 10 times LOR: 0% - , 0%; Result > 10 times LOR: 0% - 10%.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

ilac-MRA NATA
Accreditation No. 825
Accredited for compliance with ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*
[redacted]	Laboratory Coordinator	[redacted]
[redacted]	Senior Organic Chemist	[redacted]

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X: Samples (EM2208381) required dilution due to matrix interferences. LOR values have been adjusted accordingly.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X: Samples EM2208381 required dilution due to matrix interferences. LOR values have been adjusted accordingly.
- Amendment (02/06/2022): This report has been amended as a result of a request to change sample identification numbers (IDs) received from Abe Wright on 01/06/2022, for samples EM2208381 #40,43,44,51. All analysis results are as per the previous report.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS (Australian HEPA) and also conform to QSM 5.3 (US DoD) requirements.
- EP231X-INJ: The direct injection LCMSMS method may be used where the sample matrix is not suitable for Solid Phase Extraction (e.g. significant particulate load) or where only a single sample container is received.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Summary of Outliers

Outliers : Quality Control Samples

ThlDrehorbhlghQghbDoubQerDf@agge2 li bhe k uaQbt y oi broQk y UHehorb)

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **Quality Control Sample Frequency Outliers exist - please see following pages for full details.**
