Executive Summary

Introduction

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the Ongoing Monitoring Plan (OMP) for monitoring of per- and poly-fluoroalkyl substances (PFAS) at the Royal Australian Air Force (RAAF) Base Williamtown (the 'base').

Objective

The objective of implementing the OMP is to provide information on changes in location and concentrations of PFAS within the environment. The data is required to assist risk management decisions by Defence and NSW State Government agencies to protect human health and the environment.

Monitoring Scope

AECOM completed two monitoring events of groundwater, surface water and sediment, and one round of aquatic biota sampling, between January 2024 and December 2024 (the 'monitoring period') in accordance with the sampling and analysis quality plans (SAQP) developed by AECOM (2023, 2024a, 2024d).

This monitoring targeted PFAS, namely perfluorooctanesulfonic acid (PFOS), perfluorooctanoic acid (PFOA) and perfluorohexanesulfonic acid (PFHxS) as they are the primary chemicals associated with the PFAS fire-fighting foams used at the base historically.

Monitoring Results

Groundwater

As specified in the OMP, groundwater sampling in this monitoring period focused on locations at identified PFAS source areas on-base, locations at the base boundary, and off-base within the Management Area, as defined by the NSW Government.

Overall, the concentrations of PFAS in groundwater were similar to those reported in previous monitoring periods. At several on-base PFAS source areas, 'decreasing' or 'probably decreasing' trends were observed, indicating that targeted treatment of on-base source areas continues to reduce PFAS mass from the environment.

Increasing trends were observed at some off-base monitoring locations in the Primary Management Zone (as defined by the NSW Government) south of the base suggesting the core of the plume continues to migrate away from source areas in the central region of the base. Decreasing trends were observed in some locations east of the base proximate to Moors Drain. However, PFAS concentrations and the shape of the groundwater plume remains relatively consistent with the extents identified during the 2017 Detailed Site Investigation (AECOM, 2017a).

First-time detections of PFAS were reported at four locations in the off-base Management Area, and three first-time exceedances of the drinking water guidelines, were reported during the monitoring period. However, the findings were reviewed against OMP triggers and were found to present no additional risks to people or the environment.

Surface Water and Sediment

Co-located Surface Water and Sediment samples were collected on-base and off-base during the monitoring period, and focussed on identified PFAS-source areas, the base boundary and key drains within the off-base Management Area.

PFAS concentrations were similar to historical results. The highest PFAS concentrations were associated with on-base source areas and drains flowing from the base, including those in the Primary Management Zone where groundwater upwells into surface water drains.

PFAS concentrations remained within or the same order of magnitude of historical ranges with no consistent trends observed in the dataset, and present no further risks to people or the environment.

Conceptual Site Model and Risk Summary

The Conceptual Site Model (CSM) is used to describe the ways that PFAS moves from source areas on the base into the surrounding environment. Specifically, the CSM describes the links between PFAS sources, transport pathways, and possible exposure scenarios. The CSM was developed during the investigation stages and the most recent CSM is summarised in the PFAS Management Area Plan (PMAP) (Defence, 2023a).

The risk profile was established by the Human Health Risk Assessment (HHRA) (AECOM, 2017b) and Ecological Risk Assessment (AECOM, 2018) and is summarised in the PMAP (Defence, 2023a).

While there have been localised changes in PFAS concentrations during the monitoring period, risk profile associated with exposure to PFAS in groundwater, surface water and sediment have not changed.

What is an 'order of magnitude'?

This refers to something decreasing or increasing by multiples of ten. For instance, an increase from 10 to 100 is an order of magnitude increase. When assessing changes in PFAS concentrations at an individual location, all concentrations are considered when determining trends, but order of magnitude changes are discussed separately as they represent a significant change in concentrations from what was reported in the previous event.

If a change is close to established health or environmental criteria, it will also be considered significant.

Remediation Progress

Defence continued remediation actions at the base to reduce PFAS mass flux across the base boundary, in accordance with the PMAP (Defence, 2023a). During the monitoring period:

- The three water treatment plants on-base removed approximately 4.7 kg of PFAS from the environment (groundwater and surface water).
- The decrease in concentrations of the northern portion of the Western Region is likely to be attributable to the soil remediation and ongoing groundwater treatment at the former fire training area (FFTA).
- The Lake Cochran Passive Barrier system trial was successfully completed under controlled conditions, with ongoing performance to be monitored under the OMP.
- Defence is also planning to implement additional management actions to target the western plume and central plume, and potentially upgrade the Moors Drain water treatment plant, it is estimated that these proposed additional works will reduce PFAS flux entering the environment by around 30 kg per year.
- Whilst remediation progress continues across the base, the management of risks to PFAS continues to be undertaken in accordance with the actions outlined in the PMAP.

1.0 Introduction

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) at Royal Australian Air Force (RAAF) Base Williamtown (the 'base') (**Figure F1** in **Appendix A**).

The monitoring targeted PFAS in a range of environmental media at selected locations on-base and in surrounding off-base areas, including the Management Area as defined by the NSW State Government (**Figure F1** in **Appendix A** and NSW Government released figure in **Appendix D**).

In order to meet the objectives of the OMP, the monitoring was undertaken in accordance with the *Sampling Analysis and Quality Plan* (SAQP) (AECOM, 2023, 2024a and 2024f). Concurrent programs of work being delivered by Defence outside of this monitoring program were also considered. A summary of these ancillary works is presented in **Section 6.0**.

This report has been prepared in accordance with the *PFAS Investigation and Management Program Guidance Ongoing Monitoring Program Reporting* (Revision 0) issued in February 2024 (Defence, 2024) based on monitoring data collected between January 2024 and December 2024 (the 'monitoring period').

1.1 Purpose and Objective

The objective of the monitoring program set out in the OMP (Defence, 2023b) is to identify and evaluate:

- spatial and temporal (including seasonal) variability of PFAS in the environment
- changes to sources, transport pathways and/or receptors, described as a Conceptual Site Model (CSM) for the base
- whether risks to human and ecological receptors require review
- the influence that risk management activities at the base, as outlined in the PFAS Management Area Plan (PMAP) (Defence, 2023a) have had on PFAS in the environment
- whether the identified changes trigger an action and or review.

The data collected may be used to inform where new risk management actions may be required, or to support a determination that remediation has been completed so far as reasonably practicable.

1.2 Scope

The scope of works for this Ongoing Monitoring Report (OMR) included assessing PFAS data collected between January 2024 and December 2024 and evaluating if the results change the understanding of the CSM and the risk profile. This included the evaluation of data reported during the monitoring period in the following reports which are included in **Appendix G**:

- *Sampling Event Factual Report – Biota Sampling, 2024. RAAF Base Williamtown.* 31 July 2024 (AECOM, 2024c).
- *Sampling Event Factual Report, April 2024. RAAF Base Williamtown.* 25 September 2024 (AECOM, 2024e).
- *Sampling Event Report, September 2024. PFAS OMP - RAAF Base Williamtown*. 26 November 2024 (AECOM, 2024f).

The OMR also considers PFAS data collected outside the OMP.

2.0 Site Setting

2.1 Site Description

The site identification and setting are summarised in **Table 1** below:

Table 1 Site identification and setting summary

Element	Description
Site ID	0908
Site Location	The base is located at Medowie Road, approximately 15 km north of the Newcastle NSW central business district and is located in the Port Stephens local government area, as shown in **Figure F1** in **Appendix A**.
Regional Meteorology	The Bureau of Meteorology (BoM) Williamtown RAAF weather station (number 061078) has recorded data since 1942 and presents a record of approximately 80 years. Review of the BoM data for the monitoring period indicates the following: • Mean monthly maximum temperatures varied from 17.4°C in July 2024 to 30.7°C in January 2024. • The rainfall recorded at the base was 1,202 mm during the monitoring period. Assessment of rainfall during the monitoring period against the mean rainfall is presented in Section 6.4. • The mean rainfall for all years on record was 1,128.7 mm per annum. The lowest recorded annual rainfall was 541 mm in 1980 and the highest annual rainfall was 1,794 mm in 1963. The highest monthly rainfall generally occurs between January and June (averaging 115 mm per month), with the lowest rainfall in July to December (averaging 74 mm per month) (BoM, 2024).
Topography and Hydrology	The base and Management Area are situated in a generally low-lying area associated with the Lower Hunter River. The region is characterised by low sand dunes, sand sheets and estuarine mud flats. The overall change in elevation across the base and Management Area is less than 10 m (AECOM, 2017a). The base is surrounded by an interconnected network of drains, rivers, estuaries, reservoirs and coastal waterbodies within the catchment areas of both the Hunter River and Port Stephens estuary. The major elements of the regional surface water drainage network include: • Dawsons Drain, the Fourteen Foot Drain and the Ten Foot Drain, which are located to the south of the base and drain into Fullerton Cove (**Figure F1** in **Appendix A**). • Moors Drain and Tilligerry Creek, which are located to the east and southeast of the base and drain to the north east into the Tilligerry Creek arm of Port Stephens (**Figure F1** in **Appendix A**). Additionally, the following regional waterbodies are present in the area: • Grahamstown Dam located approximately 2 km northwest of the base. • Campvale Drain located 1.5 km to the north of the base. • Tilligerry Creek estuary located approximately 6 km to the east. • Port Stephens located approximately 10 km northeast.

Element	Description
	• Fullerton Cove located approximately 3 km to the southwest. • Hunter River Estuary located approximately 7 km southwest and west. • Pacific Ocean located approximately 4.5 km to the south/southeast.
Geology and Hydrogeology	The geology of the base and Management Area comprises unconsolidated sands (Tomago Sand Beds and Stockton Sand Beds) underlain by estuarine sediments (Tilligerry Mud Member). The hydrogeology of the area is characterised by two unconfined sand aquifers: • Tomago Sand Beds aquifer located northwest of Tilligerry Creek. • Stockton Sand Beds aquifer located between Tilligerry Creek and the Newcastle Bight. The Tomago Sand Beds aquifer is highly permeable and readily infiltrated by rainwater owing to the nature of the relatively coarse-grained aquifer material and shallow water table. The aquifer in the Stockton Sand Beds is approximately 10 to 20 m thick and is composed primarily of sands. PFAS source areas on the base are located on the Tomago Sandbeds and PFAS migration in groundwater appears to occur principally within that aquifer. Further migration of the PFAS plume appears to be restricted by the north-westerly groundwater flow of the Stockton Sandbeds and by the presence of the confining effects of the Tilligerry Mud Member. Groundwater has been considered from a range of depths to consider the distribution of PFAS in the environment. These include: • Shallow groundwater screened primarily between 4-6 metres below ground surface (m bgs). • Intermediate groundwater screened between 10-14 m bgs. • Deep groundwater greater than 16 m bgs.
Vegetation	The base is bounded by the Tilligerry State Conservation area to the northwest and east. The base and immediate surrounding areas comprise a mix of remnant and densely populated native vegetation with some non-native species which extends some 15 km to the east of the base and some 13 km to the west. The heavily populated vegetations areas that surround the base to the north, east and west are punctuated by tracks, roads, transmission lines and other linear infrastructure. The base is part of a broader low-lying marsh ecosystem and is often inundated, particularly to the north of the base which is naturally lower lying. Vegetation according to the Hunter, Central & Lower North Coast Vegetation Classification & Mapping Project Volume 1: Vegetation Classification technical report, report prepared by HCCREMS (2009) notes the following plant community type (PCT)/vegetation groups on-base and in surrounding areas: • PCT 1707: Banksia oblongifolia – Hakea teretifolia – Leptocarpus tenax – Lepyrodia scariosa wet heath on sandstone ranges of the Central Coast. • PCT 1647: Red Bloodwood – Smooth-barked Apple heathy woodland on coastal sands of the Central and lower North Coast.

Element	Description
	• PCT 1651: Parramatta red gum – Fern-leaved banksia – Melaleuca sieberi swamp woodland of the Tomaree Peninsula. • PCT 1721: Swamp Mahogany – Broad-leaved Paperbark – Saw Sedge – Yellow Marsh Flower swamp forest of coastal lowlands. • PCT 1650: Parramatta Red Gum – Rough-barked Apple – Swamp Mahogany – Paperbarks swamp forest on lowlands of the Central Coast. The condition of remnant vegetation on-base (and surrounds) appears to primarily be in good condition with little disturbance. Some areas of regeneration are evident on-base.
Current and Previous Land Use (on-base)	The base has been an active Defence base since 1941 and serves as the headquarters to both the Air Combat Group and the Surveillance and Response Group. In 2014, it was designated as the home base for Australia's F-35 Joint Strike Fighters. Activities undertaken on-base include training of Defence personnel in fire-fighting techniques, for which fire-fighting foams are used. PFAS were an active ingredient in legacy aqueous film forming foam (AFFF) used at the base since the early 1970s, which were phased out in 2004. Defence transitioned to Ansulite foam, which does not contain PFOS and PFOA as an active ingredient, only in trace amounts. Ansulite is only used by Defence in emergency situations where human life is at risk, or in controlled environments to test equipment.
Current and Previous Land Use (off-base)	Off-base land uses comprise rural and semi-rural settlements at Fullerton Cove and Salt Ash, small commercial properties and the Salt Ash Primary School. Tilligerry State Conservation area, managed by National Parks and Wildlife Service and occupying approximately 7.6 km^2, immediately borders the base to the west, north and east. Hunter Water Corporation (HWC) pumping stations and groundwater extraction bore fields are located to the west, north and east of the base.

2.2 Management Area

The boundary of the initial Investigation Area was defined by the NSW Government in late 2015. Following the publication of the Environmental Site Assessment report in December 2017, the NSW Government superseded the Investigation Area with the establishment of the Williamtown Management Area as described below.

The Management Area comprises three zones described below and illustrated on the NSW Government map presented in **Appendix D**:

- **Primary Management Zone** – this area has significantly higher levels of PFAS detected and directly receives PFAS-contaminated water migrating from the base. Therefore, the strongest precautionary advice applies.
- **Secondary Management Zone** – this area has some detected levels of PFAS.
- **Broader Management Zone** – the topography and hydrology of the area means PFAS detections could occur now and into the future.

The NSW Government noted that each zone has tailored precautionary advice for residents to minimise exposure to PFAS originating from the base.

2.3 PFAS Source Areas and Distribution

Source areas can be primary or secondary. Primary sources are generally areas of PFAS contamination where AFFF was used or stored, for example a fire training area. Secondary sources are areas where PFAS accumulates and then continues to feed into the environment, such as Lake Cochran. PFAS can travel from a source to human or environmental receptors via surface water and/or groundwater. These are referred to as “migration pathways”.

The updated PMAP (Defence, 2023a) provides an updated list of the PFAS sources, and the migration pathways based on the natural catchments across the base and Management Area (**Figure F1** in **Appendix A**), as follows:

- Western Region – characterised by the Former Fire Training Area (FFTA) source that is now remediated, and a PFAS groundwater plume extending south away from the source through the former Demolition of Explosive Munitions Site (DEMS) landfill. A substantial proportion of the western plume is still on-base. PFAS from the western plume is inferred to discharge to Dawsons Drain south of the base.
- Central Region – characterised by PFAS sources at the:
  - Former and Current Fire Station area, including the Former Fire Training Pad (FTP); Foam Testing Facility (FTF); and Current Fire Station (Facility 165), located centrally within the base.
  - the Sewage Treatment Plant (Facility 410), located south of the base adjacent to Newcastle Airport.
  - Lake Cochran, stormwater retention pond that receives surface water runoff from central portions of the base including the Former and Current Fire Station area.

  PFAS groundwater plumes from these sources extend south across the southern base boundary. The concentrations of PFAS south of the base and north of Cabbage Tree Road were likely sourced from Lake Cochran, which was impacted when AFFF containing high concentrations of PFAS were still in use at the base. However, Lake Cochran is no longer considered a significant ongoing PFAS source to groundwater. PFAS in the central southern plume primarily discharges into Leary’s and Dawsons Drain.
- Eastern Region – characterised by likely sources at the Trade Waste Treatment Plant (Facility 480) and the Former Fuelling Area. The PFAS impacts in the Eastern Region are primarily due to groundwater entering the drainage network and discharging to Moors Drain, which flows to Tilligerry Creek. Given that the primary pathway east of the base is via Moors Drain and groundwater flow is to the south, the groundwater plume to the east of the base is not as developed as the western and central plumes.

The dominant regional groundwater flow direction at the base is to the south and southwest, with groundwater in the Tomago Sand Beds aquifer flowing towards Fullerton Cove in the western portion of the base, while also flowing in a south easterly direction in the eastern portion of the base. Further south, groundwater from the Stockton Sand Beds aquifer flows in a north westerly direction towards Tilligerry Creek. The PFAS plumes originating from the multiple primary sources in the Western and Central Regions are merging and moving southward.

PFAS is also present in groundwater to the east of the base, including at Salt Ash, inferred to be related to PFAS in surface water migrating along the drain network (Moors Drain and associated tributaries) before infiltrating to groundwater.

2.3.1 Groundwater Impact

The groundwater flow patterns broadly reflect the regional drainage. Groundwater levels below sea level in the area are likely to reflect groundwater depressurisation caused by the deeper drainage features such as the Fourteen Foot Drain and Ten Foot Drain.

The lateral hydraulic gradient at and surrounding the base ranges from about 0.001 metres per metre (m/m) to about 0.0025 m/m (AECOM, 2017b). The gradient is indicated to be slightly steeper on-base

(0.0025 m/m) and flattens out towards a natural depression running in a southwest to northeast direction, south and east of the base (0.001 m/m).

The direction of the vertical hydraulic gradient varies across the base area. This may be due to the degree of interaction with surface water, with gaining surface water bodies associated with upward gradients and losing surface water bodies associated with downward gradients. Seasonal groundwater level fluctuations have been noted historically, with up to 0.8 m of fall in some locations that coincided with low rainfall between May 2023 and November 2023.

The two main primary sources of PFAS in surface water and groundwater at the base are the FFTA (within the Western Region); and the former FTP (within the Central Region).

Historical releases during training at the FFTA have resulted in a groundwater plume extending south from the FFTA. PFAS-impacted groundwater likely upwells into Dawsons Drain.

Remediation measures undertaken at the FFTA (including soil excavation and installation of a groundwater extraction and treatment system) have resulted in detachment of the plume from the source, however, the detached plume is still migrating towards the southern base boundary. Defence is currently planning for the extraction of groundwater along the southern boundary of the base to target this plume (refer to Section 6.1) as per the PMAP (Defence, 2023a).

Historical releases at the FTP are likely to be the source of the PFAS impacts to surface water in the Central Region (surface drains on-base, water in Lake Cochran, and Dawsons Drain) as well as the groundwater plume extending more than 500 m off-base to the south. The central region plume (southern plume) discharges to the surface in Leary's Drain which eventually discharges to Fullerton Cove.

It is also likely that the FTP is a potential contributing source for the groundwater plume in the Eastern Region, and discharges of PFAS in surface water to Moors Drain.

The discharge of PFAS in groundwater across the base boundary in the Eastern Region has been estimated to be relatively minor (less than 1% of total PFAS discharge in groundwater leaving the base). In accordance with the PMAP (Defence, 2023a) Defence is currently undertaking characterisation of PFAS impacts in surface water within the Eastern Region to refine understanding of PFAS source areas and migration mechanisms.

2.3.2 Surface Water Impact

The base is located within estuarine and coastal wetlands that have been reclaimed via a network of drains constructed to convert low lying swampy land into dry land for improve land use. These drains have provided pathways for the migration of PFAS and substantially influenced its current distribution.

The following two key drains collect surface and drainage water from the base and discharge towards the topographic depression running southwest to northeast beyond the southeastern base boundary (refer to **Figure F3** in **Appendix A**):

- Dawsons Drain:
    - Drains the western portion of the base towards the south in direction of Fullerton Cove (a shallow embayment of the nearby Hunter River). Dawsons Drain receives a significant amount of runoff from parts of the base with multiple known PFAS source areas. Much (but not all) of this water accumulates in Lake Cochran before overflowing to Dawsons Drain.
    - Lake Cochran is a man-made stormwater retention basin that, owing to its depth, intersects shallow groundwater in the southern area of the base. Modelling has supported the assumption that Lake Cochran has historically contributed PFAS-impacted surface water to groundwater.
    - Dawsons Drain flows south from Lake Cochran, passes under Cabbage Tree Road, and discharges into the Fullerton Cove Ring Drain, which discharges to Fullerton Cove via tidal gates. South of the base, Dawsons Drain likely receives upwelling groundwater containing PFAS from the western and central plumes. Dawsons Drain is unlined and provides a connection between surface water and shallow groundwater.

- Moors Drain:
  - Drains the eastern portion of the base via three channels which form two principal branches (Northern Branch and Southern Branch), and merge approximately 1 km east of the base. This drain flows for approximately 7 km north east to discharge via tidal floodgates into the Tilligerry Creek Estuary, which forms part of Port Stephens. Moors Drain receives runoff from the eastern part of the base and is a losing drain (i.e., drain water infiltrates to groundwater) along much off its length. It appears to contribute to secondary PFAS groundwater impacts to the northeast of the base towards Salt Ash and then to Tilligerry Creek Estuary.
  - It is understood that water flow from the base drainage network into Moors Drain only ceases following a prolonged dry period when groundwater levels drop due to limited infiltration and recharge. Moors Drain is unlined and provides a direct pathway to the shallow groundwater.

3.0 Sampling and Analytical Methodology

3.1 Sampling Methodology

The SAQP outlines the proposed schedule and rationale for sampling, prescribing biannual (every six-months) groundwater, surface water and sediment sampling at the base and Management Area, and biennial (every second year) aquatic biota sampling in Fullerton Cove.

The SAQP provides the list of groundwater monitoring wells, surface water, sediment, and biota locations to be sampled during each sampling event, along with the sampling methodology for each of the media. The SAQP is routinely updated prior to each sampling event based on findings from the preceding sampling event. SAQP revisions used throughout the monitoring period are listed in **Table 2**, below. The SAQP (AECOM, 2024d) prepared ahead of the September 2024 biannual sampling event has been included in **Appendix F**.

A summary of the OMP sampling events completed in accordance with the SAQP during the monitoring period is provided in **Table 2** below. Note that some locations could not be sampled due to impediments encountered during the sampling events, which are described in **Section 3.2**.

Table 2 Summary of monitoring events

Monitoring Event (Sampling dates) *Relevant SAQP*	Total Locations in Scope as per SAQP	Total Locations Sampled
January – April 2024 Biennial biota sampling event (24 January 2024 – 22 April 2024) *SAQP: AECOM, 2023*	12 composite biota	12 composite biota
April 2024 Annual sampling event (15 April – 2 August 2024) *SAQP Rev B: AECOM, 2024a*	136 GW	133 GW
	25 SW	24 SW
	26 SD	26 SD
September 2024 Biannual sampling event (19 – 27 September 2024) *SAQP Rev C: AECOM, 2024d*	68 GW	68 GW
	25 SW	25 SW
	26 SD	26 SD

Notes: GW = groundwater, SW = surface water; SD = sediment
All samples were analysed for PFAS extended suite.

3.2 Deviation from OMP requirements

Deviations from the scope outlined in SAQP for the monitoring period are summarised in Table 3 below.

Table 3 Deviations from SAQP during the monitoring period

SAQP Requirement	Sampling Event Deviation	Impact of deviation on dataset
Biennial Biota Sampling Event – January to April 2024		
Biennial biota sampling events are to be completed February	The sampling event was completed between January and April 2024. Due to the reported scarcity of sentinel species in Fullerton Cove, NSW Department of Primary Industries (DPI), Port Stephens Fisheries Institute (Fisheries) recommended extending the duration of the biota sampling event from January 2024 until April 2024 in an effort to collect the target number of individual specimens.	This change in sampling period is not considered to impact on the dataset given that it was recommended by DPI Fisheries to enable the collection of targeted species.
Fish to be euthanised by blunt force trauma followed by exsanguination	The fish were euthanised by ice in water, rather than the methodology specified in the SAQP. This alternative method was considered by DPI Fisheries to be suitable and within their permit.	This change in methodology is considered unlikely to impact on the dataset.
Record water quality parameters	During sample collection events on 19 February 2024 and 28 March 2024, DPI Fisheries did not record water quality parameters.	The lack of water quality parameters is not considered to impact the reliability of the data collected.
Annual Sampling Event – April to August 2024		
136 groundwater locations are identified to be sampled as part of the annual sampling event.	A total of five residential groundwater bore locations (POT046, POT085, POT107, POT144 and POT236) and one groundwater monitoring well (MW139), located on private property were also sampled at the request of landowners following the publication of the updated OMP (Defence, 2023b). These locations have been noted as deviations from the OMP. Of the five locations, three residential groundwater bore locations (POT046, POT085 and POT236) were not sampled as accesses approval from property owners were not received within the sampling period.	The inclusion of additional locations is not considered to have an impact on the data.
25 surface water locations are identified to be sampled as part of the annual sampling event.	Surface water location SW588 was dry and therefore could not be sampled during the event.	The lack of sampling data at this location (drain at the base boundary) is not considered to have a significant impact on the existing data or present a significant data gap given that the nearby downstream location (SW001) was able to be sampled.
	Due to safety and access considerations, the surface water sample at SW582 (a stormwater drain on base) was collected using a dedicated disposable HDPE bailer, before being decanted into laboratory supplied bottles.	Given that sampling results for SW582 were within the historical range reported at this location, the change in sampling methodology is not considered to have

SAQP Requirement	Sampling Event Deviation	Impact of deviation on dataset
		impacted upon the reliability of the data for the purposes of the OMP.
Biannual Sampling Event – September 2024		
One of the scheduled groundwater sampling locations (MW132S) has been incorrectly identified in the SAQP and OMP.	Monitoring well MW132S is a scheduled groundwater sampling location in accordance with the OMP (Defence, 2023b) and SAQP (AECOM, 2024d). During an audit of the data collected to date, it was identified that the location sampled under the OMP program was MW132I, rather than MW132S. Location MW132S appears to have been destroyed/lost. Only MW132I (intermediate well) and MW132D (deep well) are present at the sampling location cluster.	This change has no impact to the overall interpretation of the data or the program, noting that the same monitoring well had been sampled throughout the program, and data has now been reviewed against the correct historical dataset. The monitoring well MW132I is a suitable well for the purpose of the OMP. The SAQP and the OMP should be updated to replace MW132S with MW132I, on their next respective revisions. The Defence ESdat database has been updated, associating the samples collected to the correct Location Code (MW132I).

4.0 Quality Assurance and Quality Control

Data validation pertaining to the data in this report has been previously completed and discussed within the individual Sampling Event reports listed in **Section 1.2**.

Data validation procedures employed in the assessment of the field and laboratory Quality Assurance and Quality Control data, completed as per Section 3.2 of the SAQP (AECOM, 2024d), indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable (i.e. >95% of the data was suitable for use and DQIs passed acceptance criteria) for the purpose of the sampling event reports and this OMR.

All data collected during the monitoring period had been reviewed and uploaded to the Defence ESdat database in accordance with the Defence Contamination Management Manual (DCMM) requirements.

5.0 Assessment Criteria

The adopted assessment (screening) criteria references national guidance in the form of PFAS National Environmental Management Plan (NEMP) (Heads of Environment Protection Authority Australia and New Zealand [HEPA], 2025), Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance.

At the time of preparing this report, a number of national guidance documents were available in Australia and referred to including:

- HEPA, 2025. PFAS NEMP Version 3.0. 2025.
- Department of Health (DoH), 2017. Health Based Guidance Values for PFAS for use in site investigations in Australia. April 2017. This document is based on the works undertaken by Food Standards Australia New Zealand (FSANZ) in 2017 (FSANZ, 2017).
- National Health and Medical Research Council (NHMRC), 2019. Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water. August 2019 (NHMRC, 2019).
- National Environment Protection Council (NEPC), 2013. National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013 (ASC NEPM, 2013).

The adopted PFAS screening criteria to assess the data collected as part of the monitoring are presented in **Table 4**, **Table 5** and **Table 6**. It is noted that for the purpose of presenting data within this report AECOM has focused on Perfluorooctanoic acid (PFOA), Perfluorooctanesulfonic acid (PFOS) and PFOS + Perfluorohexanesulfonic acid (PFHxS) i.e., those PFAS for which there are either human health and/or ecological screening criteria.

At the time this report was prepared no assessment criteria were available in Australia for PFAS in sediments.

Table 4 PFAS water criteria summary: Human health

Media	Pathway	Chemical	Criteria	Comment/Reference
Water – Groundwater	Drinking water	PFOS+PFHxS	0.07 µg/L	The values presented in the PFAS NEMP (HEPA, 2025) are from DoH (2017) which published final health-based guidance values for PFAS for use in site investigations in Australia. DoH utilised the tolerable daily intake (TDI) for PFOS and PFOA from FSANZ (2017) and the methodology described in Chapter 6.3.3 of the NHMRC Australian Drinking Water Guidelines (ADWG, 2022) to determine drinking water values. For PFHxS, DoH 2017 noted that '*FSANZ concluded that there was not enough toxicological and epidemiological information to justify establishing a tolerable daily intake. However, as a precaution, and for the purposes of site investigations, the PFOS tolerable daily intake should apply to PFHxS. In practice, this means that the level of PFHxS exposure should be added to the level of PFOS exposure; and this combined level be compared to the tolerable daily intake for PFOS*'. *All groundwater results were screened against these criteria. It is noted that at the time when this report was prepared, revised guidance values for PFAS in drinking water had been issued in draft form by NHMRC, but not finalised.*
		PFOA	0.56 µg/L	

Media	Pathway	Chemical	Criteria	Comment/Reference
Water – Surface Water and Groundwater	Recreational use	PFOS+PFHxS	2 µg/L	The previous values presented in the 2018 PFAS NEMP were from DoH (2017), which published final health-based guidance values for PFAS for use in site investigations in Australia. However, in 2019 the NHMRC's water quality advisory recommended an alternative methodology to calculate recreational guideline value. Instead of basing it on an ingestion rate of 0.2 L of water per day (as per the *Australian Drinking Water Guidelines* [ADWG] formula), NHMRC (2019) adjusted this rate with consideration of an event frequency (150 events / year) to calculate an annual ingestion rate of 30 L per year. These NHMRC (2019) values have since been adopted under Revision 3.0 of the PFAS NEMP (HEPA, 2025). Given that groundwater at the base is extracted for irrigation purposes (post treatment), the recreational guidelines have been adopted to be protective of this water use activity. *All surface water and groundwater results were screened against these criteria.*
		PFOA	10 µg/L	

Table 5 PFAS water criteria summary: Ecological

Media	Pathway	Chemical	Criteria	Comment/Reference
Water – Groundwater and Surface Water	Freshwater	PFOS	0.00023 µg/L	The values are from the PFAS NEMP (HEPA, 2025) which endorsed the Australian and New Zealand Guidelines for Fresh and Marine Water Quality. The 99% species protection level (high value conservation systems) has been applied. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife. It is proposed that the laboratory LOR is adopted for the purposes of preliminary screening of analytical water results, rather than sole use of the criteria value. *All groundwater and surface water samples were screened against these criteria. Assessment of these criteria against groundwater results are relevant at the point of discharge.*
		PFOA	19 µg/L	

Table 6 PFAS aquatic biota screening criteria

Chemical	Criteria	Comment
FSANZ (2017) 2-6 years Crustaceans (all species)		
PFOS	0.065 mg/kg	*All school prawn sample results will be compared against these criteria*
PFHxS	0.065 mg/kg	
PFOA	0.520 mg/kg	
FSANZ (2017) 2-6 years Finfish (all species)		
PFOS	0.0052 mg/kg	*All luderick and dusky flathead sample results will be compared against these criteria*
PFHxS	0.0052 mg/kg	
PFOA	0.0410 mg/kg	

6.0 Contextual and Ancillary Information

6.1 PFAS Remediation Projects

Defence has implemented multiple remedial actions that were identified in the 2019 PMAP (Defence 2019), and subsequent updated 2023 PMAP (Defence 2023a), to manage potential PFAS exposure risks and progressively reduce PFAS migration from the base in surface water and groundwater.

PFAS remediation projects conducted within the monitoring period consisted of groundwater extraction and treatment at the three on-base water treatment plants. A summary of the three water treatment plants' performance up to November 2024 is provided below in **Table 7**.

Table 7 Water Treatment Plant performance summary

Item	MD WTP	FFTA WTP	SA WTP
Treatment commencement	June 2017	July 2018	May 2019
Volume treated since commencement (as of 20 November 2024)	983 ML	2,047 ML	1,197 ML
Average total PFAS concentrations prior to treatment (since commencement) in µg/L	4.08	18.07	12.72
Average PFOS+PFHxS concentrations prior to treatment (since commencement) in µg/L	3.56	16.73	11.34
Average PFOS+PFHxS treated water concentration (since commencement) in µg/L	< 0.01	< 0.01	< 0.01
Approx. total PFAS removed since commencement (as of 20 November 2024)	3.48 kg	34.52 kg	15.27 kg
PFAS removed in this monitoring period	0.29 kg	2.67 kg	1.77 kg

Overall, approximately 4.7 kg of PFAS was removed from the environment (groundwater and surface water) via the three water treatment plants (WTP) during this monitoring period. Further detail on each WTP is provided in the following sections.

6.1.1 FFTA Water Treatment Plant project

Defence continued the extraction and treatment of PFAS-impacted groundwater in the area of the FFTA by a pump and treat system using ionic exchange resin treatment technology. Treated water is disposed by on-base irrigation.

The annual average PFAS concentration treated by the FFTA WTP is provided in **Figure 1** and the PFAS mass removed annually by the FFTA WTP is provided in **Figure 2**. The concentrations are those measured at the inlet of the water treatment plant. **Figure 1** shows that the average influent PFAS concentration in 2023-2024 was less than half of that when the plant commenced its operation in 2018.

The PFAS mass removed has reduced from around 8.5 kg between 2018 and 2019 to about 2.76 kg between 2023 and 2024, as shown on **Figure 2**.

Defence is currently planning for the extraction of groundwater from the core of the FFTA plume via a new extraction wellfield (known as the Western Region wellfield) at the southern boundary of the base. This will involve the movement of the extraction system of the FFTA WTP to the southern boundary. This change has been made in response to the migration of the centre of mass of the plume beyond the capture zone of the current extraction system, as evidenced by the reduction in treatment concentrations and PFAS mass from the current extraction area. The commissioning of the new extraction wellfield is expected to commence in 2025.

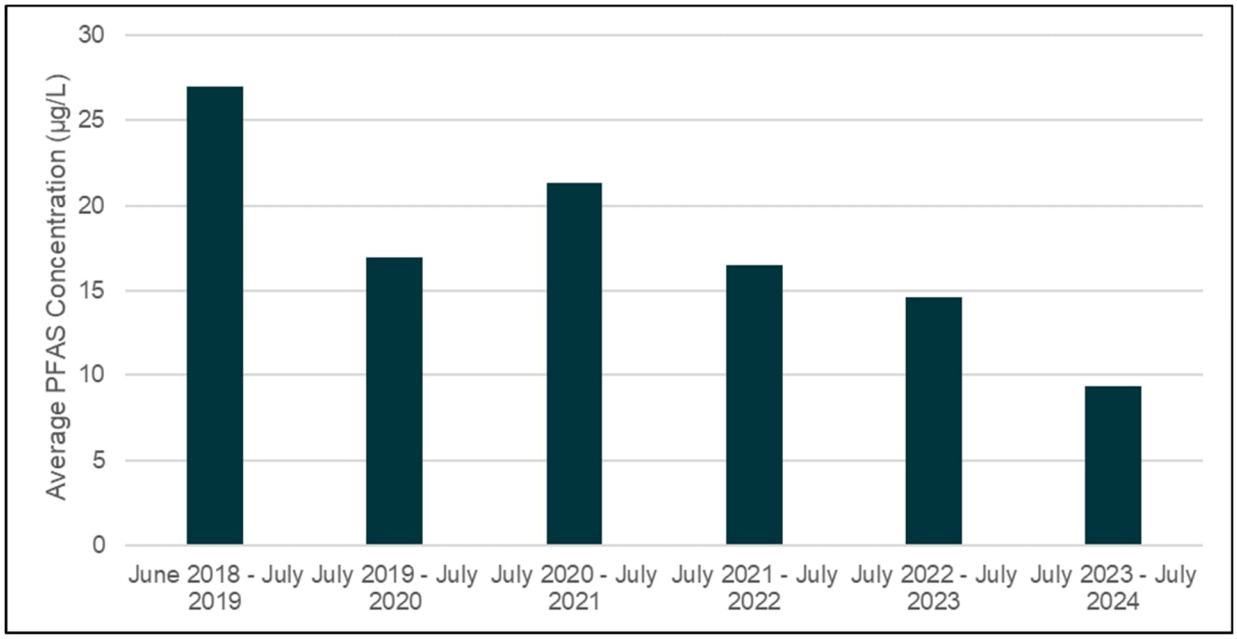

Figure 1 Annual average PFAS concentration treated by FFTA WTP

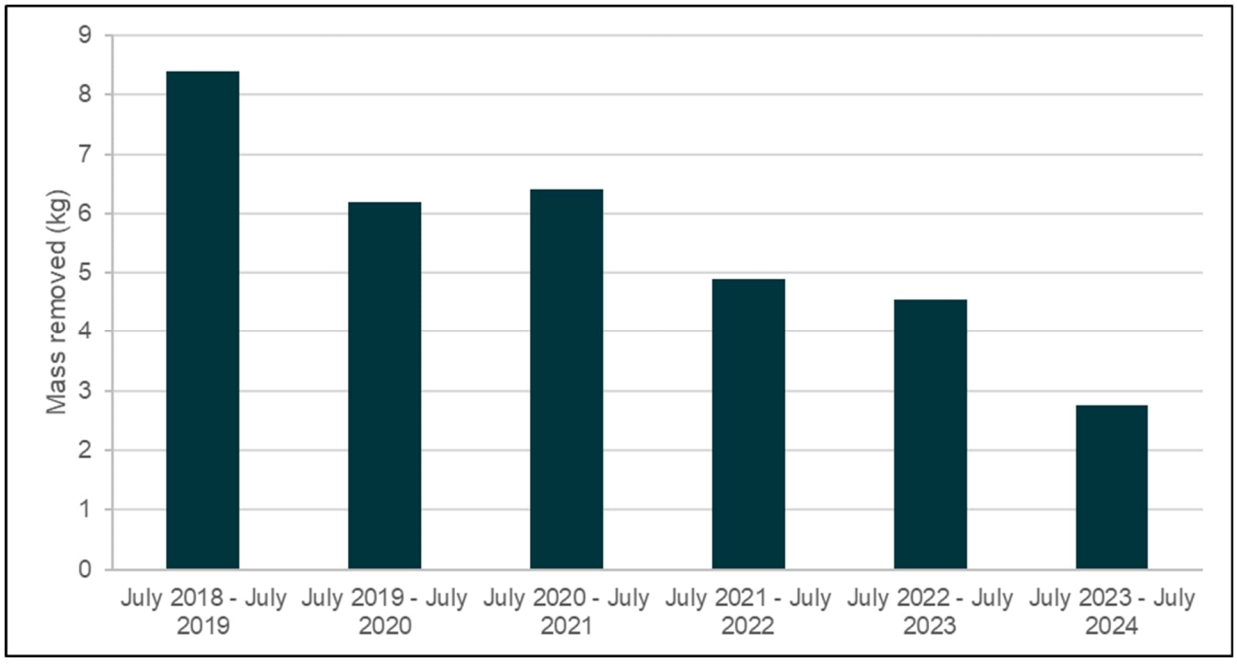

Figure 2 Annual PFAS mass removed by FFTA WTP

6.1.2 Southern Area (SA) WTP project

Defence continued the extraction of groundwater from the Southern Area (area immediately south of Lake Cochran, within the base) using ionic exchange resin treatment technology. Treated water is disposed via irrigation on the base.

The annual average PFAS concentration treated by the SA WTP is provided in **Figure 3** and the PFAS mass removed annually by the SA WTP is provided in **Figure 4**. PFAS concentrations are measured at the inlet of the water treatment plant.

The influent PFAS concentrations have decreased since WTP commencement in 2019, with about 30% decrease in 2023-2024 concentrations when compared to 2019-2020, as shown on **Figure 3**.

The annual PFAS mass removal has reduced from around 4.8 kg between 2019 and 2020 to about 2 kg between 2023 and 2024 is shown on **Figure 4**. The decrease in PFAS concentrations and PFAS mass removal values is supported by groundwater modelling that indicates the majority of the central plume PFAS mass has migrated south beyond the extraction wellfield.

Defence is currently designing and planning for an off-base groundwater extraction wellfield (and associated pipeline) between the southern base boundary and Cabbage Tree Road. The new extraction wellfield would allow treatment of off-base portions of the central plume and would result in the cessation of groundwater extraction from the current extraction wellfield located south of Lake Cochran.

Defence is also planning to trial an in-ground permeable reactive barrier to treat groundwater along the southern boundary of Lake Cochran, upgradient of the current extraction wellfield, to continue remediation of remaining PFAS mass in this area. The design of the trial permeable reactive barrier is expected to commence in 2025.

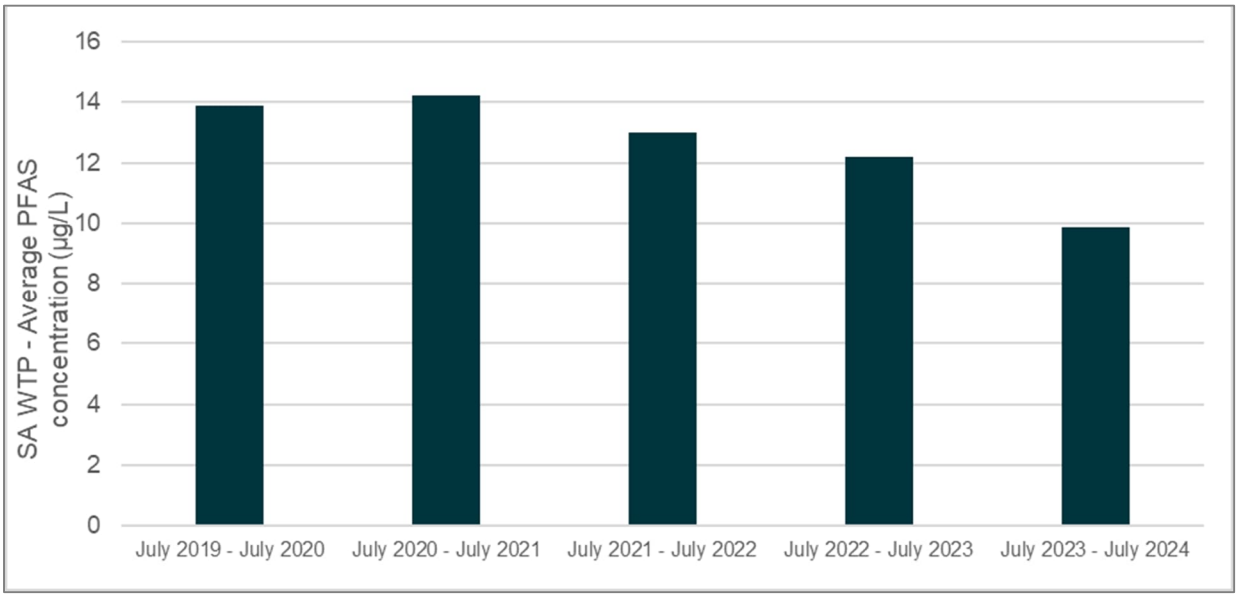

Figure 3 Annual average PFAS concentration treated by SA WTP

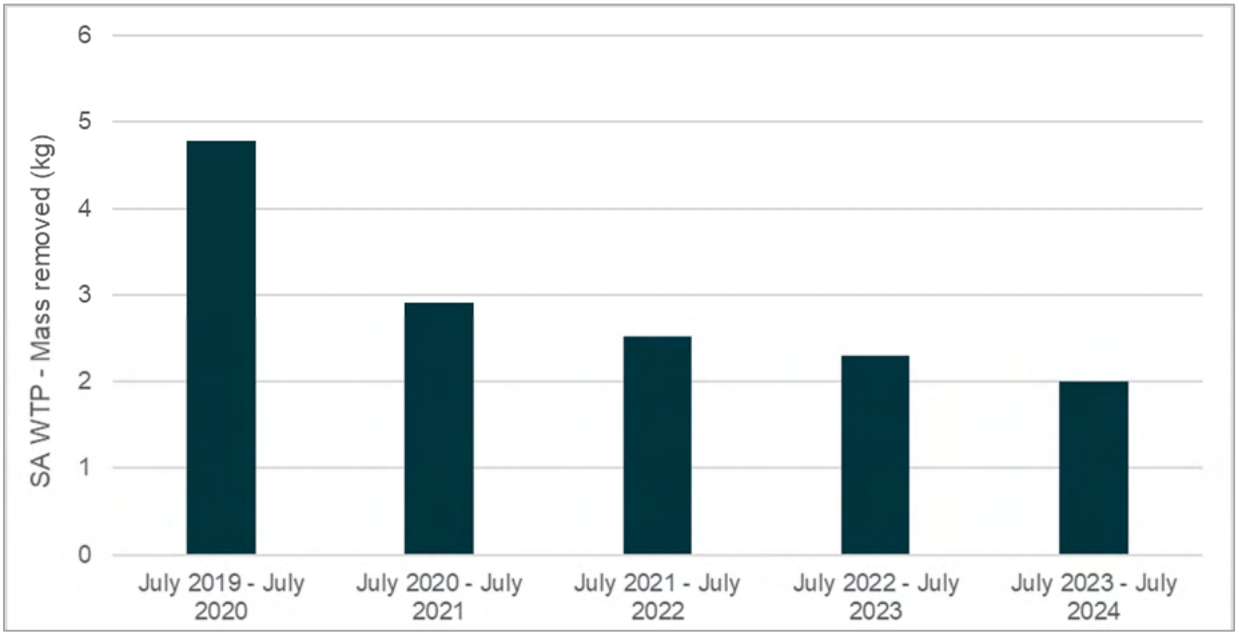

Figure 4 Annual PFAS mass removed by SA WTP

6.1.3 Moors Drain WTP project

Defence continued the treatment of PFAS-impacted stormwater discharging under Medowie Road to the northern branch of Moors Drain, via the Moors Drain WTP (MD WTP). The MD WTP extracts water from a stormwater pit which receives flow from stormwater pipes draining the northern areas of the base. Stormwater is treated using ionic exchange resin technology and treated water is discharged back to Moors Drain approximately 3 m downstream from the stormwater pit extraction point.

Defence is undertaking further characterisation of PFAS impacts and PFAS migration mechanisms in the Eastern Region (i.e. on-base Moors Drain catchment) to optimise MD WTP performance and inform other PFAS management strategies (potentially targeting source areas). A summary of these investigations is outlined in **Section 6.2**.

The annual average PFAS concentration in influent received at MD WTP is shown on **Figure 5**. Given that the WTP influent is derived from stormwater influent, PFAS concentrations may potentially be diluted in the short term by significant rainfall events (refer to **Figure 6**). However influent concentrations have decreased steadily from approximately 5.7 µg/L in 2017-2018 to approximately 2.35 µg/L in 2023-2024, independent of short term rainfall impact.

The annual mass of PFAS removed by the WTP has varied over time, peaking between 2019 and 2021, when the treatment capacity was increased. The PFAS mass removed has reduced from around 0.7 kg between 2020 and 2021 to about 0.4 kg between 2023 and 2024, as shown on **Figure 7**.

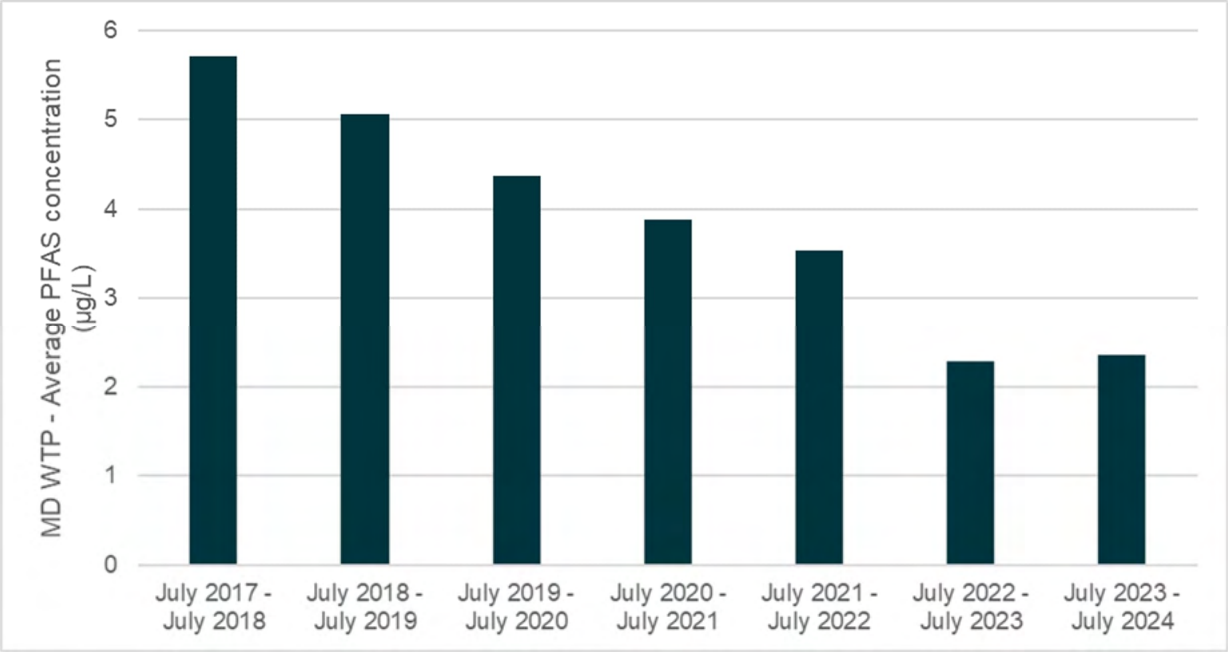

Figure 5 Annual average PFAS concentration treated by MD WTP

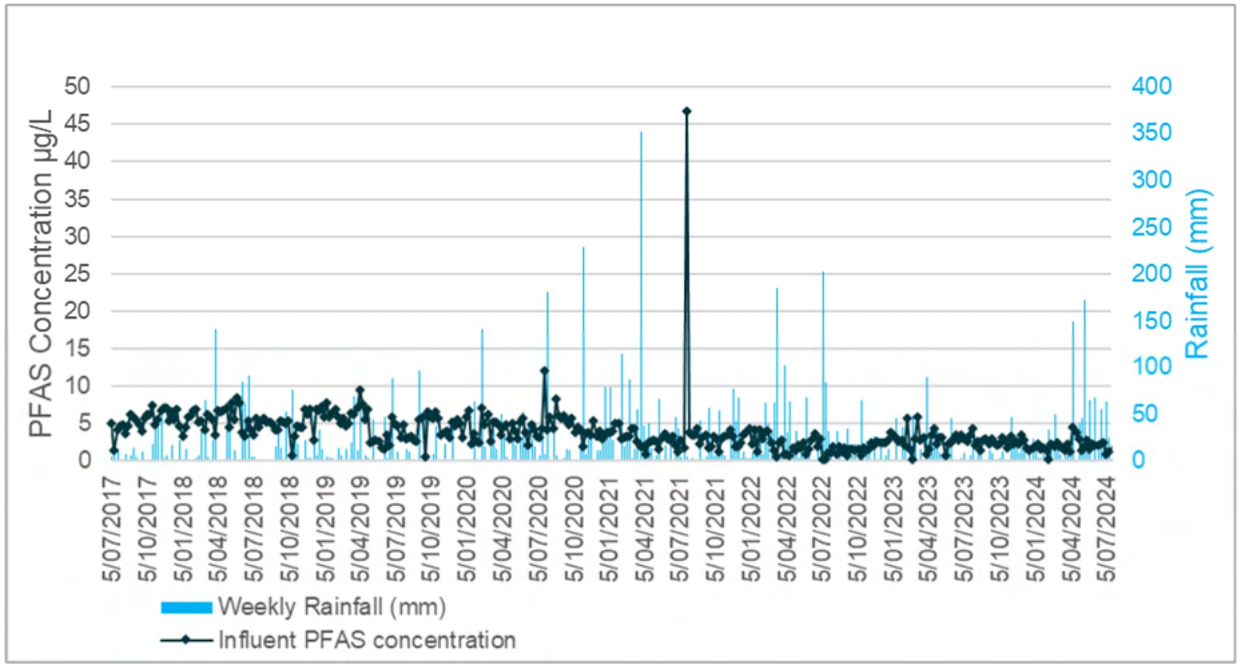

Figure 6 Influent PFAS concentration vs local rainfall (*Source*: ETC2, 2024)

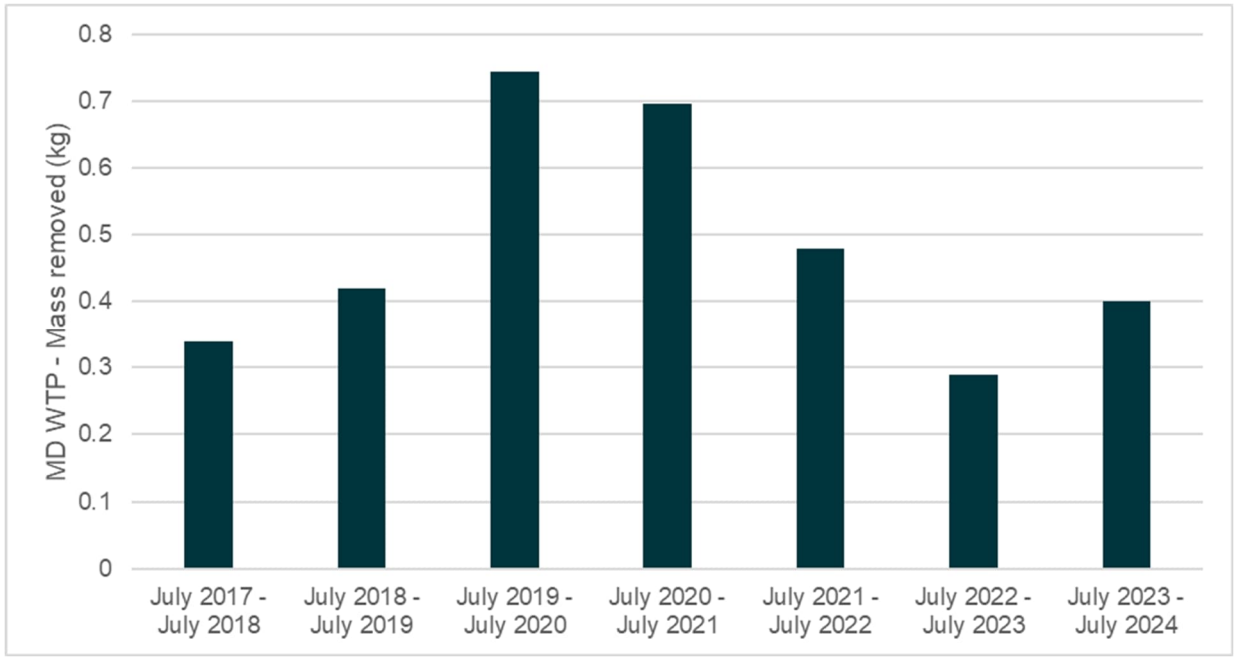

Figure 7 Annual PFAS mass removed by MD WTP

6.1.4 Lake Cochran Passive Barrier System

A trial passive surface water treatment system was installed on the discharge point of Lake Cochran in 2019 to evaluate the feasibility of a passive surface water treatment option for the waterbody. The system consisted of a four stage in-situ design at the Lake Cochran inflow and outflow channels. Each of the stages use coal-based and coconut-based Granular Activated Carbon (GAC) in specific sequence to absorb PFAS and treated water flows to Dawsons Drain.

The trial was delayed due to high rainfall and groundwater levels and was eventually completed in April 2024. The trial was successful under controlled conditions, and ongoing performance will be monitored under the OMP.

6.2 PFAS Characterisation Projects

Data from the following current PFAS characterisation projects have been included in the dataset referenced by this OMR. Where applicable, the data from these projects have been used to update the understanding of the CSM and evaluate changes in the characteristics of the PFAS plume.

6.2.1 Eastern Catchment Study

AECOM undertook two rounds of sampling at 53 surface water locations across the Eastern Region catchment in September and November 2024. The works were initiated as per the recommendations of the Groundwater Strategy Review (GWSR) (Geosyntec, 2022) and updated PMAP (Defence, 2023a) to refine the understanding of PFAS sources and transport mechanisms within the catchment.

The study also includes rain event sampling to be completed in 2025. The findings from the study will be used to optimise PFAS management actions within the Eastern Region, in particular the performance of the MD WTP.

6.2.2 Former and Current Fire Station Data Gap Assessment

Defence is currently reviewing previous investigation and remedial works completed at the Former and Current Fire Station area. The purpose of the review is to identify where data gaps exist, identify constraints, and determine what further remedial actions may be undertaken to manage PFAS sources at this area of the base. Further characterisation works to address data gaps will be completed in 2025. The works were initiated as per the recommendations of the Groundwater Strategy Review (GWSR) (Geosyntec, 2022) and updated PMAP (Defence, 2023a).

6.2.3 Ad Hoc Sampling

AECOM completed ad hoc sampling (i.e. outside of the OMP) of properties within the Management Area during the monitoring period.

6.3 Infrastructure Projects

6.3.1 National Airfield Works (P0008)

Infrastructure works associated with the National Airfield Works (project P0008) commenced in 2022 and continued through the monitoring period. These works involve the delivery of a major aircraft pavement, stormwater drainage and maintenance works. It is understood that the project requires soil management and dewatering as part of runway and stormwater drainage upgrade works.

A large material stockpile associated with the project was established adjacent the northern edge of Lake Cochran in 2022, with standard construction erosion and sediment controls in place. The stockpile is located adjacent to groundwater monitoring locations MW179S and MW179D, and surface water monitoring locations SW108 and SW110 within Lake Cochran. Note that PFAS concentrations in MW179S, MW179D, SW108 and SW110 were either within historical ranges or within an order of magnitude of historical ranges during the monitoring period (refer to Section 7.0 and Section 8.0), indicating that the potential for impact from the stockpiled material at these locations is low.

6.3.2 Stormwater Dewatering Project

Localised dewatering was undertaken as part of stormwater drain network upgrade north of Lake Cochran between 22 August 2023 and 12 January 2024. Over 155 ML of water was removed and directed to Lake Cochran via the inflow drain during dewatering activities.

Surface water monitoring data were collected prior to dewatering commenced (from 5 July 2022), during dewatering activities, and following completion of dewatering activities (until 22 January 2024). Samples were collected at the entry point from the base drain to Lake Cochran, and at the exit of the lake (but still within Lake Cochran) and have been provided by Defence for consideration. However it is noted that the majority of the dataset was reported outside of the monitoring period.

6.3.3 Greater Newcastle Aerotropolis

Land clearing and earthworks associated with the Greater Newcastle Aerotropolis development has continued beyond the southern base boundary south of Lake Cochran. These activities are however not expected to impact the results of the monitoring data.

6.4 Significant Weather Events

During the monitoring period, the Hunter Region experienced higher precipitation than the previous monitoring period as recorded at the BoM monitoring station located at RAAF Base Williamtown (Station ID 061078). The data for the monitoring period is presented in **Figure 8** against historical ranges on record since the weather station commenced operation in 1942.

Included in **Figure 8** is a 6-month Standardised Precipitation Index (SPI), which presents monthly rainfall against the average monthly rainfall as a value, where 1 is average rainfall, and where 2 is twice the average monthly rainfall. This allows for medium term assessment on the rainfall experienced by the area over the monitoring period.

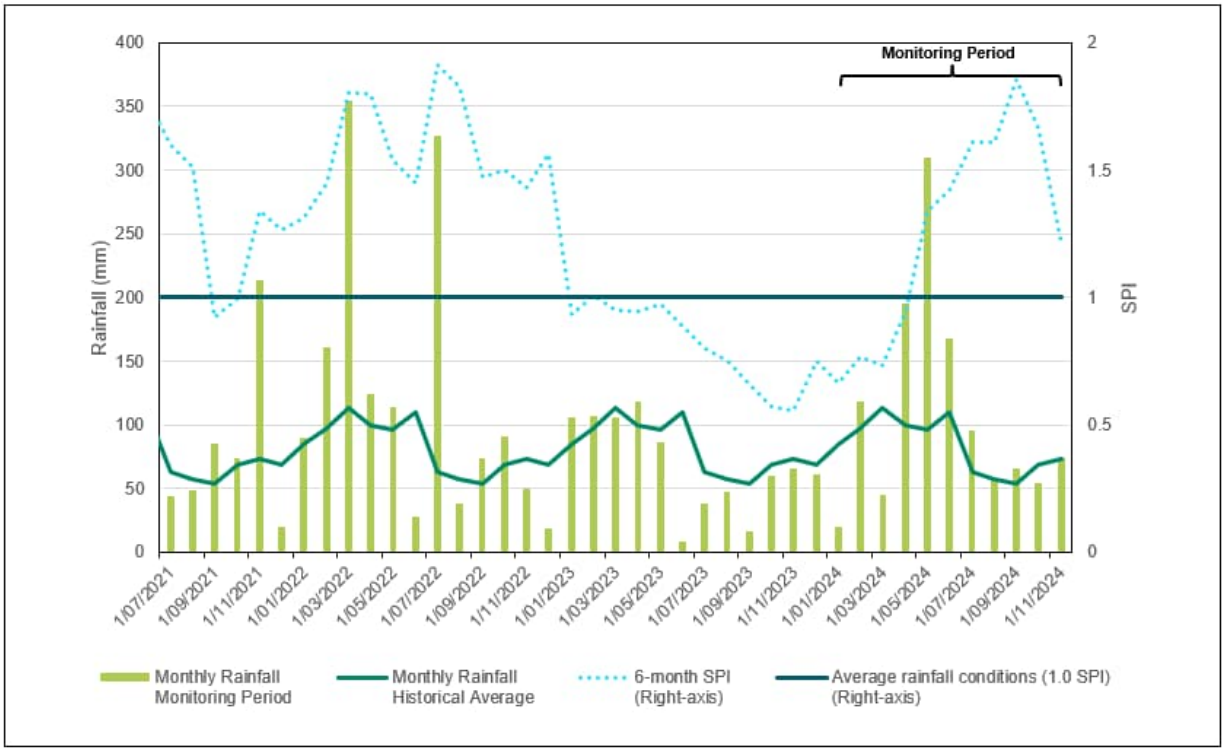

Figure 8 Rainfall data from January 2024 to November 2024. Rainfall data from Williamtown RAAF monitoring station (station 061078) (BoM, 2024)

The rainfall activity during the sampling events over the monitoring period for the BoM monitoring station (Station ID 061078) and the occurrence of wet weather event (days with rainfall >15 mm) are summarised in **Table 8** below.

Table 8 Rainfall during monitoring period

Sampling Event and Dates	Recorded rainfall (mm) (BoM, 2024) for month	Wet weather events immediately prior or during the sampling period (days with rainfall >15 mm)
April 2024 Annual Sampling Event 15 April to 24 April 2024 (main event)	195.4 (April 2024, total)	5 April 2024 (42.8 mm) 6 April 2024 (103.6 mm) 21 April 2024 (23.4 mm)
September 2024 Biannual Sampling Event 19 September to 27 September 2024	65.8 (September 2024, total)	27 September 2024 (24 mm)

From the review it is noted that the area typically experienced above average rainfall in the first half of the monitoring period (i.e. late summer, autumn and winter) with one month in this period (May 2024) experiencing greater than double the historical average rainfall.

The higher-than-average rainfall experienced between April 2024 and August 2024 has the potential to impact upon the interpretation of the data, as follows:

- The increased volume of surface waters being present in the broader catchment has the potential to increase the distribution of PFAS compounds within the surface water bodies. PFAS concentrations may become diluted, report lower than historical concentrations and result in PFAS being detected at greater distances from the source.
- Potential to disperse PFAS to shallow soils via increased surface run off from source areas.
- Potential for increased mixing between shallow groundwater and surface water.
- Increase in groundwater elevation may result in longer contact with impacted soils.

However, it is acknowledged that the Management Area has been subject to multiple significant flood events historically, and PFAS concentrations in stormwater discharges from the base would have been higher when PFAS containing AFFF was regularly being used. As a result, it is unlikely that these flood events have significantly changed the lateral extent of PFAS impacts within the Management Area. The potential impact of rainfall on PFAS impact and migration during the monitoring period is discussed further in **Section 8.0**.

Rainfall between September 2024 and November 2024 was closer to the historical average albeit with minor fluctuations above and below long-term monthly averages.

6.5 Off Base Activities

Whilst ongoing development associated with the Newcastle Airport precinct to the south of the base continued during the monitoring period, there were no changes in residential land use or water usage observed during field activities and /or reported in the off-base monitoring areas during the monitoring period.

7.0 Monitoring Data Summary

As part of the OMP, the following three scheduled monitoring events were completed by AECOM over the monitoring period:

- Biennial biota sampling undertaken in January 2024 (supplementary sampling undertaken on 28 March and 22 April 2024).
- Annual surface water, sediment and groundwater sampling undertaken in April 2024 (15 April 2024 to 9 May 2024, with resampling and additional sampling undertaken on 31 July 2024 and 2 August 2024).
- Biannual surface water, sediment and groundwater sampling undertaken in September 2024 (19 September 2024 to 27 September 2024).

The sample locations are shown on **Figure F2** to **Figure F4** in **Appendix A**. Results are summarised in following sections.

The monitoring activities are summarised in the OMP Sampling Event Reports provided in **Appendix G**. In addition to the OMP data, AECOM also considered the historical data for the base and off-base areas that are available in the Defence database.

7.1 Groundwater Results

7.1.1 Groundwater Field Observations

Groundwater monitoring well condition and field observations at the locations visited are provided in **Table T1** and **Table T2** in **Appendix B** and key observations are summarised below:

April 2024

- MW208 was identified to potentially be blocked based on gauged depth, however a sample was still able to be collected from this location.
- No visible indications of contamination were observed in groundwater during the sampling. Sulphurous like odours were noted at 38 groundwater locations. Organic odours were noted at 17 groundwater locations.

September 2024

- MW106S, MW264D, MW268D, MW897D: wells may have a blockage close to the base of the wells. Note that groundwater was able to be sampled from within the screen interval.
- MW230S, MW278D: well gatic was full of water to above top of casing. The water was removed prior to sampling at each location. Given the J-caps were secure, water ingress into the wells was unlikely, and the groundwater sampled was considered representative.
- No visible signs of contamination in groundwater were noted at the locations sampled. Sulphurous odours were observed at 35 groundwater locations. Organic odours were noted at six groundwater locations (MW128S, MW166, MW167, MW175D, MW178, MW271D).

7.1.2 Groundwater Elevations

The standing water level (SWL) was measured in each monitoring well prior to sampling, and in select monitoring wells during a targeted gauging round conducted during each monitoring event, to evaluate groundwater elevations (GWE). The SWL and GWE from the monitoring period are presented in **Table T1** in **Appendix B** and are summarised below in **Table 9** for shallow/intermediate and deep aquifers.

Table 9 Summary of groundwater elevations

Gauging Event	No. Wells	Min. SWL (mbTOC)	Max. SWL (mbTOC)	Min. GWE (mAHD)	Max. GWE (mAHD)
Shallow/Intermediate aquifer					
April 2024	84	0.000 (MW252S)	3.769 (MW304)	-0.063 (MW128S)	8.180 (MW264S)
September 2024	50	0.120 (MW230S)	2.346 (MW132I)	-0.198 (MW231S)	8.936 (MW264S)
Deep aquifer					
April 2024	58	0.000 (MW231D)	2.904 (MW210D)	0.337 (MW316D)	8.177 (MW264D)
September 2024	35	0.140 (MW231D)	2.351 (MW132D)	0.431 (MW231D)	8.941 (MW264D)

Note: mAHD = metres relative to Australian Height datum, mbTOC = metres below Top of Casing.
Min = Minimum, Max = Maximum

GWEs for both shallow and deep groundwater aquifers were similar between April 2024 and September 2024 events, however fluctuations of up to 0.7 m were reported at some locations, likely due to elevated rainfall reported during the monitoring period (in particular in May 2024). GWEs remained within the historical ranges reported in monitoring periods between 2019 and 2023.

7.1.3 Groundwater Flow Directions

The sampling events were timed to target different rainfall periods, based on historical rainfall data recorded at the BoM weather station (061078) located at the base. In general, historical rainfall data indicates the greatest rainfall occurs in late summer and autumn with the least rainfall occurring in winter and spring. In general, this trend was observed during the monitoring period, noting rainfall significantly above the historical average was observed in late April 2024 to June 2024.

The SWLs measured in groundwater monitoring wells during each event were converted to groundwater elevations (in mAHD). Depth to groundwater measurements are presented in **Table T1** in **Appendix B**. The inferred potentiometric contours for:

- April 2024 sampling event is presented in **Figures F5** (shallow aquifer interval) **Figures F6** (deep aquifer interval), in **Appendix A**.
- The September 2024 sampling event are presented in **Figures F7** (shallow aquifer interval) and **F8** (deep aquifer interval) in **Appendix A**.

The data from the monitoring period indicates that:

- Groundwater on the base, and south and east of the base, flows to the south and southeast towards Fullerton Cove (Tomago Sand Beds Aquifer) and Tilligerry Creek.
- To the south of Ten Foot Drain and Fourteen Foot Drain, groundwater is flowing to the north/northwest (Stockton Sand Beds Aquifer).

The flow directions were consistent across both the shallow and deep groundwater profiles with those measured in 2017 (AECOM, 2017a) and throughout the previous monitoring periods.

On average GWEs for both shallow and deep groundwater were typically within the historic range of measurements at each well location.

Historically a strong correlation between rainfall and groundwater level fluctuation at the base has been observed. Typically, large rainfall events result in a rapid rise in groundwater levels, in excess of 0.8 m, followed by a relatively slow decline. However, above average rainfall received in late April 2024 (213 mm above average), May 2024 (58 mm above average), and June 2024 (33 mm above average) appear to have attenuated by the September 2024 sampling event.

Groundwater flow directions in the Tomago Sand Beds aquifer within the monitored area remained consistent with historical trends, with flow inferred to the south/south-west towards Fullerton Cove in the western portion of base, and southeast towards Tilligerry Creek in the eastern portion of the base. Groundwater flow in the Stockton Sand Beds aquifer, located between Tilligerry Creek and the Newcastle Bight, was inferred in a northwest direction, towards Tilligerry Creek.

7.1.4 Groundwater Quality Parameters

Groundwater quality parameters were measured during the collection of groundwater samples. The stabilised readings of groundwater quality parameters from the monitoring period are presented in **Table T2** in **Appendix B**, and summarised below in **Table 10** for locations on-base and within the management zones.

Table 10 Summary of groundwater quality parameters

Sampling Event	Dissolved Oxygen (mg/L)		Temperature (°C)		Electrical Conductivity (µS/cm)		pH (pH units)		Oxidation-Reduction Potential, corrected (mV)	
	Min	Max	Min	Max	Min	Max	Min	Max	Min	Max
On-base										
April 2024	0.34 (MW171D)	5.48 (MW171S)	15.6 (MW155)	24.9 (MW304)	5.0 (MW169S)	1,826 (MW109D)	4.19 (MW340S)	7.02 (MW342D)	48.9 (MW171D)	447.8 (MW886)
September 2024	0.70 (MW108S)	6.70 (MW167)	16.3 (MW340S)	22.7 (MW175D)	43.6 (MW168)	267 (MW172)	4.5 (MW340S)	6.79 (MW342D)	152 (MW344D)	428.4 (MW166)
Primary Management Zone										
April 2024	0.54 (MW278S)	4.34 (MW238S)	16.3 (MW731S)	28.6 (MW126S)	5 (MW731D)	1,921 (MW271S)	4.49 (MW238S)	6.74 (MW731D)	29.7 (MW278D)	443.1 (MW238S)
September 2024	0.36 (MW238D)	3.82 (MW271S)	17.9 (MW278S)	20.8 (MW238D)	169.7 (MW731S)	1,102 (MW238S)	5.39 (MW178)	6.64 (MW278D)	96.1 (MW238S)	291.5 (MW178)
Secondary Management Zone										
April 2024	0.30 (MW150S)	9.30 (MW121)	13.6 (MW132I)	25.7 (MW146S)	66.6 (MW130D)	25,702 (MW147D)	4.47 (MW130S)	7.18 (MW256D)	-2.5 (MW279S)	441.1 (MW829)
September 2024	0.52 (MW130S)	5.54 (MW829)	14.5 (MW107S)	20.6 (multiple)	78.5 (MW146AD)	1,011 (MW279S)	4.6 (MW130S)	6.99 (MW279S)	135.3 (MW279S)	335.7 (MW132I)
Broader Management Zone										
April 2024	0.02 (MW844)	3.32 (POT144)	13.7 (MW159S)	24.3 (MW252S)	68.6 (MW159S)	24,857 (MW316D)	4.86 (MW280S)	7.88 (POT382)	-5.2 (MW163)	342.3 (MW159S)
September 2024	0.35 (MW231S)	5.09 (MW128S)	16.1 (MW280S)	22.4 (POT382)	133.6 (MW280S)	16,477 (MW231D)	5.07 (MW280S)	8.02 (POT382)	47.1 (POT382)	298.2 (MW280S)

The readings presented in **Table 10** indicate groundwater conditions during the monitoring period to be:

- Poor to well oxygenated.
- Fresh to saline.
- Moderately acidic to neutral.
- Mild to moderately reducing conditions.

The water quality parameters reported in each event during the monitoring period were within previous data ranges, with the exception of higher dissolved oxygen and electric conductivity in groundwater at discrete locations on-base, in the Southern Area, Tilligerry Creek, Fourteen Foot Drain and Fullerton Cove Ring Drain.

7.1.5 Groundwater Analytical Results

Groundwater analytical results from the monitoring period as well as available historical groundwater analytical results for OMP sampling locations (including data from other projects) are presented in **Table T5** in **Appendix B**.

Groundwater results for the monitoring period are presented spatially on **Figure F9** to **Figure F12** in **Appendix A**. The interpretive assessment of the groundwater analytical results is discussed in **Section 8.0**.

Additionally, OMP and other historical groundwater concentrations of PFOS+PFHxS and PFOA have been displayed graphically on temporal trend graphs in **Appendix C**, grouped by management zone and areas on the base, for the locations in **Table 11** below.

Table 11 Temporal trend graphs of groundwater locations

Graph ID	Management Zone/Source Area	Groundwater locations
G1, G2	Primary Management Zone	MW126S, MW126D, MW178, MW188S, MW188D, MW238S, MW238D, MW271S, MW271D, MW278S, MW278D, MW731S, MW731D
G3, G4	Secondary Management Zone	MW123, MW132I, MW132D, MW161S, MW161D, MW247S, MW279S

		PFOS	<LOR (multiple)	0	NA	0
		PFOS+PFHxS	<LOR (multiple)	0	0	NA

Notes:

[1] = Sample counts include intra-laboratory and inter-laboratory duplicates

multiple = the value applies to multiple locations

NA = Not applicable – where there are no applicable Human Health screening criteria for PFOS, and no applicable Ecological screening criteria for the Sum of PFOS and PFHxS.

QC = Quality Control (sample)

Human health criteria relates to recreational criteria for locations on the base and both drinking water and recreational criteria for locations within the Management Area.

Deviations from the historical dataset for groundwater recorded during the monitoring period are summarised in **Table E1** in **Appendix E**, and in **Table 13** below.

Table 13 Groundwater deviations

Deviation Type	Analyte	Area	Location ID
First-time detections	PFOA	On-base	MW201D, MW340D, MW344D
		Secondary Management Zone	MW146AD
	PFOS	Primary Management Zone	MW271D
		Secondary Management Zone	MW257S
		Broader Management Zone	MW270D
	PFOS+ PFHxS	Secondary Management Zone	MW257S
		Broader Management Zone	MW270D
New exceedances of drinking water guidelines	PFOA	Primary Management Zone	MW731S, MW731D
	PFOS+ PFHxS	Broader Management Zone	MW270S
New exceedances of recreational water guidelines	PFOS+ PFHxS	On-base	MW201D
		Secondary Management Zone	MW146AD
New exceedances of ecological guidelines (freshwater 99%)	PFOS	Primary Management Zone	MW271D
		Secondary Management Zone	MW257S
		Broader Management Zone	MW270D

7.2 Surface Water Results

The location of key surface water features and pathways, as well as PFAS sources, are presented on **Figure F1** in **Appendix A** and surface water sample locations are shown on **Figure F3** in **Appendix A**.

As noted in **Section 6.4** above-average rainfall was recorded in the first half of the monitoring period, including three days where rainfall exceeded 20 mm in a 24-hour period. Additionally, 103.6 mm of rainfall was reported in 24 hours on 6 April 2024. While no direct observations were reported on this date, it is inferred that low-lying areas of the base and drainage network were temporarily inundated.

7.2.1 Surface Water Field Observations

Surface water field observations from the monitoring period are presented in **Table T3** in **Appendix B** and key observations are summarised below.

April 2024

- No odours were noted, with the exception of SW005 and SW014 which had sulphurous odours, and SW019 and SW600 which had organic odours.
- No visible signs of contamination were observed at the locations sampled.
- Water flows were observed at most locations (with the exception of SW588, located on-base which was dry) with water depths varying between 0.1 m deep (at SW011) and 1m deep at multiple off-base locations. The water observed in the surface water bodies appeared to be a result of rainfall prior to sampling being undertaken. The recorded depths at each location are included with the descriptions in **Table T3**, **Appendix B**.

September 2024

- Organic odours were noted at seven surface water locations (SW001, SW011, SW047, SW055, SW079, SW081 and SW259).
- No visible signs of contamination were observed at the locations sampled.
- Water flows were observed at most locations with the recorded depths shallower than those in the April 2024 sampling event. The observations are provided in **Table T3**, **Appendix B**.

7.2.2 Surface Water Quality Parameters

Surface water quality parameters were measured during the collection of surface water samples. The surface water quality parameters for each event during the monitoring period are presented in **Table T3** in **Appendix B**, and summarised below in **Table 14** for locations on-base and within the management zones.

Table 14 Summary of surface water quality parameters

Sampling Event	Dissolved Oxygen (mg/L)		Temperature (°C)		Electrical Conductivity (µS/cm)		pH (pH units)		Oxidation-Reduction Potential, corrected (mV)	
	Min	Max	Min	Max	Min	Max	Min	Max	Min	Max
On-base										
April 2024	2.90 (SW055)	10.28 (SW048)	21.0 (SW055)	28.3 (SW047)	65.2 (SW108)	174.9 (SW110)	5.76 (SW582)	6.53 (SW108)	222.6 (SW048)	272.7 (SW110)
September 2024	2.27 (SW588)	7.18 (SW048)	18.6 (SW055)	27.6 (SW048)	98.1 (SW048)	192.6 (SW588)	5.42 (SW047)	6.82 (SW108)	191.0 (SW588)	377.8 (SW047)
Primary Management Zone										
April 2024	2.71 (SW060)	4.21 (SW333)	21.0 (SW333)	21.5 (SW060)	177.5 (SW333)	1,476 (SW060)	4.21 (SW333)	5.59 (SW060)	271.9 (SW060)	488.3 (SW333)
September 2024	2.05 (SW060)	4.32 (SW333)	18.3 (SW333)	19.6 (SW060)	173.1 (SW060)	192.6 (SW333)	5.69 (SW060)	5.97 (SW333)	276.5 (SW333)	311.7 (SW060)
Secondary Management Zone										
April 2024	2.64 (multiple)	8.14 (SW007)	21.5 (SW019)	25.0 (SW001)	129.3 (SW009)	2,372 (SW023)	4.45 (SW059)	7.46 (SW023)	112.0 (SW600)	485.1 (SW059)
September 2024	4.16 (SW006)	6.87 (SW019)	15.2 (SW011)	25.8 (SW059)	129.5 (SW007)	3,382 (SW600)	5.94 (SW011)	7.96 (SW019)	229.6 (SW600)	358.5 (SW001)
Broader Management Zone										
April 2024	1.44 (SW079)	5.15 (SW024)	18.3 (SW259)	23.1 (SW062)	1,488.0 (SW014)	11,173 (SW024)	5.84 (SW014)	7.05 (SW024)	191.1 (SW062)	485.9 (SW259)
September 2024	1.80 (SW079)	6.08 (SW005)	15.3 (SW014)	21.7 (SW081)	178.5 (SW014)	15,035 (SW259)	6.00 (SW014)	7.32 (SW062)	142.8 (SW079)	344.3 (SW005)

The readings presented in **Table 14** indicate:

- Generally oxygenated conditions.
- Generally fresh, with some brackish water (over 1,500 µS/cm) or saline conditions noted in off-base locations.
- Acidic to near neutral conditions.
- Oxidising to moderately reducing conditions.
- Temperature ranges are considered consistent with background conditions for the time of year of the sampling being conducted in each event.

7.2.3 Surface Water Analytical Results

Surface water analytical results from the monitoring period as well as the available historical surface water analytical results for OMP sampling locations (including data from other projects) are presented in **Table T6** in **Appendix B**.

Surface water results for each event during the monitoring period are presented spatially on **Figure F13** to **Figure F16** in **Appendix A**. The interpretive assessment of the surface water analytical results by region is discussed in **Section 8.0**.

Additionally, OMP and other historical surface water concentrations of PFOS+PFHxS and PFOA have been displayed graphically on temporal trend graphs in **Appendix C**, grouped by catchment/area of interest, for the locations in **Table 15** below.

Table 15 Temporal trend graphs of surface water locations

Graph ID	Catchment /Area of interest	Surface Water locations
15, 16	Lake Cochran and On-base Drains	SW047, SW048, SW108, SW110
17, 18	Dawsons Drain	SW055, SW059, SW060, SW333
19, 20	Fourteen Foot and Ten Foot Drains and Fullerton Ring Drain	SW062, SW081, SW259, SW600
21, 22	Moors Drain	SW001, SW005, SW006, SW007, SW009, SW014
23, 24	Tilligerry Creek	SW019, SW023, SW024, SW079

A summary of surface water results for each event during the monitoring period are provided in **Table 16** for locations on-base and within the management zones.

Table 16 Summary of PFOA, PFOS and PFOS+PFHxS concentrations in surface water

Sampling Event	No. of Samples[1]	Compound	Concentration Range (µg/L) in Sampling Event	No. of Samples[1] with Concentration > LOR	No. of Samples[1] with Exceedances of Human Health Criteria	No. of Samples[1] with Exceedances of Ecological Criteria

7.3 Sediment Results

7.3.1 Sediment Field Observations

Sediment field observations from the monitoring period are presented in **Table T4** in **Appendix B**.

The sediment observations during the monitoring period varied between sand/silt/clayey sand and trace gravels which were light brown to dark brown, black or grey, and generally included organic matter in the form of rootlets and/or algae and/or leaves.

7.3.2 Sediment Analytical Results

Sediment analytical results from the monitoring period as well as the available historical sediment analytical results for OMP sampling locations (including data from other projects) are presented in **Table T7** in **Appendix B**.

Sediment results for each event during the monitoring period are presented spatially on **Figure F17** to **Figure F20** in **Appendix A.** The interpretive assessment of the sediment analytical results is discussed in **Section 8.0**.

Additionally, OMP and other historical PFOS+PFHxS and PFOA concentrations for sediment are displayed graphically on temporal trend graphs in **Appendix C**, grouped by catchment/area of interest, for the locations in Table 18 below.

Table 18 Temporal trend graphs for sediment concentrations by catchment / area of interest

Graph ID	Catchment /Area of interest	Sediment locations
G25, G26	Lake Cochran and on-base drains	SD047, SD048, SD108, SD110
G27, G28	Dawsons Drain	SD055, SD059, SD060, SD333
G29, G30	Fourteen Foot and Ten Foot Drains, Fullerton Cove Ring Drain and Tidal Gate Outlet	SD062, SD081, SD259, SD600
G31, G32	Moors Drain	SD001, SD005, SD006, SD007, SD009, SD011, SD014
G33, G34	Tilligerry Creek	SD019, SD023, SD024, SD079

A summary of sediment results for each event during the monitoring period are provided in Table 19 for locations on-base and within the management zones.

Deviations from the historical dataset for sediment are summarised in **Table E3** in **Appendix E**.

Table 19 Summary of PFOA, PFOS and PFOS+PFHxS concentrations in sediment

Sampling Event	No. of Samples[1]	Compound	Concentration Range (mg/kg) in Sampling Event	No. of Samples[1] with Concentration > LOR

		PFOS+PFHxS	0.0004 (SD259) to 0.0657 (SD024)	9
September 2024	7 Primary	PFOA	<LOR (multiple) to 0.0003 (SD024)	1
		PFOS	0.0004 (SD014) to 0.0318 (SD259)	7
		PFOS+PFHxS	0.0004 (SD014) to 0.0535 (SD259)	7

Other (Fullerton Cove tidal gate outlet)				
April 2024	3 Primary	PFOA	<LOR (multiple) to 0.0005 (SD254)	1
		PFOS	0.0109 (SD255) to 0.0229 (SD254)	3
		PFOS+PFHxS	0.0109 (SD255) to 0.0247 (SD254)	3
September 2024	3 Primary	PFOA	<LOR (SD254) to 0.0005 (SD255)	2
		PFOS	0.0078 (SD254) to 0.0366 (SD255)	3
		PFOS+PFHxS	0.0078 (SD254) to 0.038 (SD255)	3

Notes:

[1] = Sample counts include intra-laboratory and inter-laboratory duplicates

multiple = the value applies to multiple locations

QC = Quality Control (sample)

Deviations from the historical dataset for sediment, recorded during the monitoring period are presented in **Table E3** in **Appendix E**, and summarised in **Table 20** below.

Table 20 Sediment deviations

Deviation Type	Analyte	Area	Location ID	Number of Deviations
First-time detection	PFOA	Primary Management Zone	SD333	1
		Secondary Management Zone	SD600	1
	PFOS	Primary Management Zone	SD333	1
	PFOS+ PFHxS	Primary Management Zone	SD333	1
New Maximum	PFOA	Primary Management Zone	SD333	1
		Secondary Management Zone	SD600	2
		Broader Management Zone	SD024	1
	PFOS	Primary Management Zone	SD333	1
		Secondary Management Zone	SD001, SD023, SD600	3
		Broader Management Zone	SD259	1
	PFOS+ PFHxS	Primary Management Zone	SD333	1
		Secondary Management Zone	SD001	1
		Broader Management Zone	SD259	1
New Minimum	PFOA	Primary Management Zone	SD333	2
	PFOS	Primary Management Zone	SD333	2
		Secondary Management Zone	SD600	1
	PFOS+ PFHxS	Primary Management Zone	SD333	2
		Secondary Management Zone	SD600	1
		Broader Management Zone	SD259	1

Note: * SD333 was sampled for the first time in the monitoring period, commencing during the April 2024 sampling event, as such there is no historical dataset for this location. The detections and exceedances were flagged as first-time detections and new minimums/maximums.

7.4 Aquatic Biota Results

Aquatic biota analytical results from the monitoring period as well as the available historical aquatic biota analytical results are presented in **Table T8** in **Appendix B**.

The monitoring activities are provided in the biota sampling event report (AECOM, 2024c) in **Appendix G**, and a summary of the results from the 2024 event is provided in **Table 21** for each species. The interpretive assessment of the aquatic biota analytical results is discussed in **Section 8.5**.

Table 21 Summary of PFOA, PFOS and PFHxS concentrations in aquatic biota

Analyte	Number of samples analysed	Number of detections	Minimum concentration (mg/kg)	Maximum concentration (mg/kg)
Dusky Flathead (*Platycephalus fuscus*)				
PFOS	4	4	0.0054	0.010
PFHxS	4	1	<0.0001	0.0002
PFOA	4	0	<0.0001	<0.0001
Luderick (*Girella tricuspidata*)				
PFOS	4	4	0.0036	0.0042
PFHxS	4	0	<0.0001	<0.0001
PFOA	4	0	<0.0001	<0.0001
School Prawn (*Metapenaeus macleayi*)				
PFOS	4	4	0.0048	0.012
PFHxS	4	4	0.0015	0.0017
PFOA	4	4	0.00031	0.00037

A summary of the PFAS concentrations detected in the tissue samples are as follows:

- PFOS was detected in all biota composite samples with concentrations ranging between 0.0036 mg/kg and 0.012 mg/kg.
- The PFOS concentrations in the four dusky flathead composite samples analysed were above the FSANZ (2017) finfish trigger value of 0.0052 mg/kg (for children aged between two and six years). PFHxS was reported in one dusky flathead composite sample (0.00017 mg/kg), however the concentration was an order of magnitude below the FSANZ (2017) finfish trigger value of 0.0052 mg/kg (for children aged between two and six years).
- The PFOS concentrations in the four luderick composite samples analysed were below the FSANZ (2017) finfish trigger value of 0.0052 mg/kg (for children aged between two and six years).
- The PFOS concentrations in the four school prawn composite samples analysed were below the FSANZ (2017) crustacean trigger value of 0.065 mg/kg (for children aged between two and six years).
- PFHxS was detected for the first time at a concentration above the laboratory limit of reporting (LOR) in dusky flathead. The reported concentration of PFHxS (0.0002 mg/kg) was below the FSANZ (2017) finfish trigger of 0.0052 mg/kg.
- PFHxS and PFOA were also reported in the composite samples collected from the school prawn with concentrations ranging between 0.0015 and 0.0017 mg/kg for PFHxS and between 0.00031 to 0.00037 mg/kg for PFOA, which were all below the adopted FSANZ (2017) crustacean trigger value.

The concentrations of PFAS were reported within the historical range (for samples collected between 2016 and 2022) for the respective sentinel species analysed with the exception of the first-time detection of PFHxS in dusky flathead. It is noted that the concentration of 0.0002 mg/kg reported during the current monitoring period is below the historical laboratory LOR of 0.0005 mg/kg, which suggests

that this compound was likely present at trace concentrations during historical sampling events, however they were below the laboratories limit of reporting at the time.

No other PFAS were detected at concentrations above the laboratory LORs in the luderick and dusky flathead composite samples analysed. Trace concentrations of PFNA, PFDA, PFPeS, PFHpS and N-MeFOSAA were reported in the school prawn composite samples above the laboratory LOR, however there are currently no screening criteria for these compounds.

The water quality parameters at the time of sampling are summarised in AECOM (2024e) (in **Appendix G**).

7.5 Non-OMP data

Groundwater, surface water and soil/sediment samples were collected in association with PFAS characterisation projects or ad-hoc sampling at properties within Management Area as summarised in Table 23 to Table 22, below.

Table 22 Summary of non-OMP sampling – Surface Water

Sampling Project (date)	Locations sampled	Compound	Concentration range (µg/L) (location)
Eastern Region (2 baseline events) (Sep 2024 – Nov 2024)	34	PFOS+PFHxS	0.03 – 55.4 (SW637, November 2024)
		PFOA	<0.01 – 0.59 (SW637, November 2024)

Table 23 Summary of non-OMP sampling – Groundwater

Sampling Project	Locations sampled	Compound	Concentration range (µg/L) (location)
Management Area (November 2024)	9	PFOS+PFHxS	<0.002
		PFOA	<0.002

Table 24 Summary of non-OMP sampling – Soil

Sampling Project (date)	Locations sampled	Compound	Concentration range (mg/kg) (location)
Management Area (November 2024)	9	PFOS+PFHxS	<0.0002 – 0.0006
		PFOA	<0.0001 - <0.0002

8.0 Interpretive Analysis

8.1 Overview

Key changes observed during the monitoring period with respect to the OMR objectives (**Section 1.1**), OMP Triggers (**Section 8.6**), and general plume characteristics are provided in the following sections. The key changes in PFAS results are presented in **Figures F21** to **Figure F23** (in **Appendix A**).

The current inferred PFAS plume is presented on **Figure F24** (in **Appendix A**).

8.1.1 Groundwater Temporal Trend Analysis

Mann Kendall analysis was used to assess trends in groundwater PFAS concentrations at representative on-base source areas, and off-base management zones (as presented in **Table 11**, in **Section 7.1.5**). The analysis is used to determine whether temporal datasets have a monotonic upward or downward trend. The significance of these trends is determined by the confidence factor, or *p* value, of the analysis, as follows.

- a confidence factor over 95% indicates that there is an ‘increasing’ or ‘decreasing’ trend.
- a confidence factor over 90% indicates the there is a ‘probably increasing’ or ‘probably decreasing’ trend.
- a confidence factor less than 90% indicates ‘stable’ or ‘no change’.

Trend analysis was only undertaken for locations which were sampled in the monitoring period, and for locations at which PFAS were consistently reported greater than the LOR. The data used in this analysis was sourced from up to the last 40 concentrations reported for each sample location. Where sample results were less than the LOR, half the LOR[1] was adopted for the Mann Kendall analysis.

It is noted that the significance of calculated trends may be overstated where outliers and results close to the LOR are included in the dataset of interest. These potential limitations to trend analysis have been considered during assessment of the trend data.

Where appropriate, temporal graphs and Mann Kendall analysis for PFOS+PFHxS and PFOA concentrations are discussed in the following sections.

8.1.2 Surface Water and Sediment Temporal Trend Analysis

An assessment of temporal trends for PFOS+PFHxS and PFOA concentrations in surface water and sediment has been undertaken for select monitoring locations representative of on-base sources and off-base management areas of interest (as presented in **Table 15** and **Table 18**, in **Section 7.3.2**).

Note that Mann Kendall analysis was not used to assess the trends in PFAS concentrations in surface water and sediment, given that variables such as rainfall, which influence PFAS concentrations, are not factored into the analysis.

The 30-day average daily rainfall total (in mm) has been included on the temporal trend graphs to allow for assessment of the influence of rainfall on PFAS concentrations.

Continued monitoring will provide a greater temporal dataset and enable more refined assessment of whether any actual increasing trends represent defined contamination migration pathways from source areas, or merely fluctuation in concentrations.

Where appropriate, temporal trends for PFOS+PFHxS and PFOA concentrations are discussed in the following sections.

8.2 Western Region

PFAS concentrations at the former FFTA footprint (MW166, MW167 and MW168) continued to decrease in the monitoring period following the excavation of PFAS impacted soil in 2018, and ongoing treatment of groundwater (2018 to present). PFOA and PFOS+PFHxS concentrations in the monitoring period were up to one order of magnitude lower than concentrations reported prior to remediation

[1] Where multiple LOR thresholds were present for a sample location, the average of half the LOR values was used.

works. The northern extent of the groundwater plume, in the vicinity of the FFTA, now appears to be disconnecting from the source area.

PFAS concentrations in groundwater wells to the west and southwest of the western region plume (off-base locations MW107S/D, MW280S and MW315S) remained similar or decreased indicating plume extent is relatively stable in these directions.

Notwithstanding, PFAS concentrations at the eastern edge of the plume (MW172), and south of the plume (MW108S) continued to demonstrate increasing trends, indicative of the plume core's continued southerly migration from the FFTA. This southerly migration is further evidenced by first time detections of PFOA in the deep groundwater unit at MW340D and MW344D on the southern base boundary.

MW340D and MW344D are located within the new Western Region extraction wellfield where Defence plans to commence groundwater extraction and treatment in 2025. This is an action from the updated PMAP (Defence, 2023a) with the aim of reducing PFAS mass flux across the boundary (refer to **Section 6.1.1**).

Future monitoring, both via the OMP and the western region wellfield-specific operational monitoring, will provide further information on mass reduction of the plume in this area.

Refer to **Graph G7** and **Graph G8** (in **Appendix C**) and the relevant Mann Kendall analysis (in **Appendix C**) and **Table 25** below.

Table 25 Summary of trend analysis: FFTA

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann Kendall Analysis	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW108S	PFOA	< LOR – 0.58	0.01 – 0.02	*No Trend*	78.6%
	PFOS+PFHxS	< LOR – 6.89	2.2 – 2.95	Probably Increasing	91.2%
MW166	PFOA	0.02 – 0.4	0.02	*Decreasing*	*95.2%*
	PFOS+PFHxS	7.58 – 126.2	12.2 – 12.4	Decreasing	>99.9%
MW167	PFOA	< LOR – 6.85	0.05 – 0.10	Decreasing	>99.9%
	PFOS+PFHxS	2.75 – 563.00	25.4 – 28.1	Decreasing	>99.9%
MW168	PFOA	< LOR – 1.30	0.26 – 1.97	No Trend	50.8%
	PFOS+PFHxS	3.53 – 94.43	4.86 – 28.6	Decreasing	>99.9%
MW169D	PFOA	< LOR – 0.13	< LOR	*Decreasing*	99.4%
	PFOS+PFHxS	0.09 – 8.32	0.06 – 0.18	Decreasing	99.9%
MW169S	PFOA	< LOR – 0.08	< LOR	*Decreasing*	*99.9%*
	PFOS+PFHxS	0.18 – 1.06	0.16 – 0.32	Decreasing	99.9%
MW172	PFOA	< LOR – 0.14	0.02 – 0.08	*Increasing*	>99.9%
	PFOS+PFHxS	< LOR – 2.03	0.72 – 4.31	Increasing	>99.9%
MW281S	PFOA	1.67 – 8.75	0.71 – 1.43	Decreasing	>99.9%
	PFOS+PFHxS	51.00 – 283.00	26.8 – 113.00	Decreasing	99.8%
MW282S	PFOA	< LOR – 3.41	0.1 – 0.31	No trend	88.6%
	PFOS+PFHxS	0.11 – 70.7	2.7 – 3.12	Probably Decreasing	95%
MW354S	PFOA	3.21 – 5.77	1.72 – 4.34	Stable	59.2%
	PFOS+PFHxS	40.6 – 120	42.1 – 81.8	Stable	59.2%

Note:
Only one result is reported in the Min-Max Range where the values are the same.
Italics: indicate low confidence in the Mann Kendall trend analysis given concentrations are within 1 to 2 orders of magnitude of the LOR.

8.3 Central Region

An assessment of PFAS impacts within the Central Region is provided by source area (on-base) and management zone (off-base) in the following sections.

8.3.1 On-base: Former and Current Fire Station

Groundwater

PFAS concentrations in groundwater at, and downgradient of, the Former and Current Fire Station continued to reduce during this monitoring period. The continued decreasing trends were observed at MW196 (on the western edge of the former and Current Fire Station) and MW201S and MW202S (downgradient of Former and Current Fire Station) following the completion of targeted soil remediation works in 2020 and indicative of the core of the plume associated with this source area continuing to migrate south.

Refer to **Graph G11** and **Graph G12** and the relevant Mann Kendall analysis (in **Appendix C** and **Table 26** below).

Table 26 Summary of trend analysis: Former and Current Fire Station

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann Kendall Analysis	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW196	PFOA	0.05 – 0.68	0.11	*Decreasing*	98.1%
	PFOS+PFHxS	4.08 – 47.5	11.6	Decreasing	97.9%
MW198	PFOA	0.02 – 0.59	0.1	*No Trend*	98.6%
	PFOS+PFHxS	0.71 – 24.45	4.9	No Trend	75.5%
MW200	PFOA	< LOR – 0.01	< LOR	Not assessed*	
	PFOS+PFHxS	0.14 – 0.59	0.47	*No Trend*	72.9%
MW201S	PFOA	0.02 – 0.35	0.01	*No Trend*	52.7%
	PFOS+PFHxS	1.56 – 24.90	1.24	Probably Decreasing	90.2%
MW202S	PFOA	< LOR – 0.03	0.01	*Stable*	85.3%
	PFOS+PFHxS	0.20 – 2.45	0.87	Decreasing	95.2%

Note:
Only one result is reported in the Min-Max Range where the values are the same.
Italics: indicate low confidence in the Mann Kendall trend analysis given concentrations are within 1 to 2 orders of magnitude of the LOR.
* Insufficient sample numbers (less than four results over LOR) at this location to allow for statistical assessment.

8.3.2 On-Base: South of Lake Cochran

Groundwater

PFAS concentrations in shallow groundwater south of Lake Cochran generally continued to demonstrate stable or decreasing trends. However, increasing trends for both PFOA and PFOS+PFHxS were reported in deep well MW175D to the south of Lake Cochran, and may be associated with this well's proximity to the discharge point of Lake Cochran. Although an increasing trend is reported, the PFOA and PFOS+PFHxS concentrations have remained within the same order of magnitude since 2019.

Defence is planning to trial a groundwater permeable barrier south of Lake Cochran to intercept residual PFAS impacts migrating in groundwater at this portion of the base. This is an action from the updated PMAP (Defence, 2023a) and aims to reduce PFAS mass flux from the base.

Refer to **Graph G9** and **Graph G10** and the relevant Mann Kendall analysis (in **Appendix C** and **Table 27** below).

Table 27 Summary of trend analysis: South of Lake Cochran

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann Kendall Analysis	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW109D	PFOA	0.01 – 0.89	0.01 – 0.10	Stable	73.5%
	PFOS+PFHxS	1.53 – 56.7	1.27 – 8.38	Probably Decreasing	93.0%
MW175D	PFOA	< LOR – 0.20	0.10 – 0.11	*Increasing*	99.9%
	PFOS+PFHxS	0.04 – 10.40	4.73 – 5.80	Increasing	99.8%
MW466*	PFOA	< LOR – 1.33	0.12 – 0.18	Stable	73.4%
	PFOS+PFHxS	1.79 – 42.3	6.80 – 19.00	Decreasing	97.9%
MW468	PFOA	< LOR – 0.79	0.11 – 0.27	*Decreasing*	95.8%
	PFOS+PFHxS	1.92 – 53.6	8.34 – 15.70	Decreasing	98.3%

Note:
Italics: indicate low confidence in the Mann Kendall trend analysis given concentrations are within 1 to 2 orders of magnitude of the LOR.
* Mann Kendall Analysis is based on 40 data points from 2016 to 2023, excluding data from 2014.

Surface Water and Sediment

PFAS concentrations in surface water and sediment were measured at four surface water drains associated with Lake Cochran as follows:

- Northern inflow drain to Lake Cochran (SW047/SD047 and SW108/SD108).
- Outflow drain from Lake Cochran to Dawsons Drain (SW110/SD110).
- Northwestern drain that bypasses Lake Cochran and connects to the Lake Cochran outflow drain (SW048/SD048).

PFAS concentrations were typically stable within historical ranges at these locations. However, concentrations appear to be increasing in surface water and sediment since 2018 at:

- SW048: (PFOA and PFOS+PFHxS).
- SD048: (PFOS+PFHxS, though concentrations have generally remained below 0.01 mg/kg).
- SD110 (PFOS+PFHxS).

Although, the concentrations may be increasing, there is however fluctuations in concentrations which require further data to confirm whether there is an increasing trend.

Temporal data are presented on **Graph G15** and **Graph G16** (surface water) and **Graph 25** and **Graph 26** (sediment) in **Appendix C**.

8.3.3 Primary Management Zone

Groundwater

South from Lake Cochran, within the Primary Management Zone, PFAS concentrations to the east and west of the plume appear to be stable (including some locations reported <LOR) or have no trend indicating the lateral extents of the plume are well defined. However, the plume core continued to migrate south towards Cabbage Tree Road as evidenced by:

- Continued increasing PFOS+PFHxS trends in groundwater at the toe of the plume (southern front) at MW126S, MW178, MW271S and MW731S.
- The first-time detection of PFOS in the deep groundwater unit at MW271D, and new exceedances of PFOA drinking water criterion in both shallow and deep groundwater at MW731S and MW731D.

Note that the southerly movement and extents of the plume are supported by the groundwater modelling (Watershed Hydrogeo, 2024), and therefore the above impacts observed during the monitoring period are not unexpected.

Defence is currently planning for the implementation of the off-base groundwater extraction wellfield between the southern base boundary and Cabbage Tree Road to mitigate PFAS mass flux from this area to the Primary Management Zone.

Refer to **Graph G1** and **Graph G2** and the relevant Mann Kendall analysis (in **Appendix C**) and **Table 28** below.

Table 28 Summary of trend analysis: Primary Management Zone

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann Kendall Analysis	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW126S	PFOA	0.04 – 0.68	0.17 – 0.28	*Probably increasing*	*93.6%*
	PFOS+PFHxS	0.49 – 23.00	6.63 – 10.3	Increasing	97.7%

	PFOS+PFHxS	< LOR – 0.44	0.15 – 0.27	*Increasing*	*>99.9%*
MW188S	PFOA	< LOR – 0.09	0.01	*No Trend*	*85.9%*
	PFOS+PFHxS	0.02 – 3.80	0.25	No Trend	84.0%
MW188D	PFOA	0.05 – 0.25	0.19	*No Trend*	64.0%
	PFOS + PFHxS	0.79 – 8.52	5.29	No Trend	86.2%
MW238S	PFOA	< LOR	< LOR	Not assessed*	
	PFOS+PFHxS	< LOR	< LOR	Not assessed*	
MW238D	PFOA	< LOR	< LOR	Not assessed*	
	PFOS+PFHxS	< LOR	< LOR	Not assessed*	
MW271S	PFOA	< LOR	< LOR	Not assessed*	
	PFOS+PFHxS	< LOR – 0.08	0.03 – 0.13	*Increasing*	*98.2%*
MW271D	PFOA	< LOR	< LOR	Not assessed*	
	PFOS+PFHxS	< LOR – 0.05	< LOR – 0.05	Not assessed*	
MW278S	PFOA	< LOR	< LOR	Not assessed*	
	PFOS+PFHxS	< LOR – 0.02	< LOR	Not assessed*	

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann Kendall Analysis	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW278D	PFOA	< LOR	< LOR	Not assessed*	
	PFOS+PFHxS	< LOR – 0.05	< LOR	Not assessed*	
MW731S	PFOA	0.3 – 0.36	0.59 – 0.90	*Increasing*	95.8%
	PFOS+PFHxS	21.6 – 22.10	25.00 – 26.80	Increasing	95.8%
MW731D	PFOA	0.16	0.58 – 0.61	Not assessed*	
	PFOS+PFHxS	5.22	20.9 – 23.5	Not assessed*	

Note:

Only one result is reported in the Min-Max Range where the values are the same.

Italics: indicate low confidence in the Mann Kendall trend analysis given concentrations are within 1 to 2 orders of magnitude of the LOR.

* Insufficient sample numbers (less than four results over LOR) at this location to allow for statistical assessment.

Surface Water and Sediment

Groundwater migrating from the base to the Primary Management Zone is known to up well into surface water drains providing a significant migration pathway for PFAS-impacted groundwater in the area. Groundwater impacted by the central region plume is known to discharge to Leary's Drain which feeds to Fourteen Foot Drain and eventually Fullerton Cove. To a lesser extent, PFAS-impacted groundwater associated with the western region plume is inferred to upwell along the length of Dawsons Drain, which also drains to Fullerton Cove.

PFOA and PFOS+PFHxS concentrations along Leary's Drain (SW060/SD060) and Dawsons Drain (SW055/SD055, SW059/SD059 and SW333/SD333) historically show considerable fluctuations over time coinciding with rainfall, and no consistent trends are evident in the datasets.

PFAS concentrations in surface water at Leary's Drain remained approximately an order of magnitude higher than Dawsons Drain during the monitoring period, which is due to upwelling of the central region plume into Leary's Drain. This is the dominant PFAS migration pathway in the Primary Management Zone.

Temporal trend graphs for surface water (**Graph G17** and **Graph G18)** and sediment (**Graph G27** and **Graph G28)** are presented in **Appendix C**.

8.3.4 Secondary Management Zone and Broader Management Zone (South)

Groundwater

PFAS concentrations in groundwater within the Secondary Management Zone, south of the Primary Management Zone, remained stable (including <LOR) or had no trend, indicating the relative stability of the plume extent. A first-time exceedance of the drinking water criteria was reported at MW270S in the southern Broader Management Zone in September 2024. However, PFAS impacts have historically been present at this area during the OMP and previous investigations and do not indicate recent southern migration of the plume.

At MW146AD, a first-time detection of PFOA, and a first-time exceedance of the recreational criteria for PFOS+PFHxS, was reported in Apil 2024. However, results at this location in September 2024 were reports less than LOR. MW146AD is located at the boundary of the Primary Management Zone and Secondary Management Zone and may be influenced by the southerly migration of the central region plume. Additional monitoring will confirm if any consistent trends are apparent at this location.

Surface Water and Sediment

PFAS concentrations in surface water and sediment at Fourteen Foot Drain, Ten Foot Drains and Fullerton Cove Ring Drain continued to fluctuate over time with no consistent trends identified in the datasets. The results reaffirm, alongside groundwater trend data, that the plume in the southern extent of the Secondary Management Zone is stable.

Apparent increasing trends were identified for PFOA and PFOS+PFHxS in sediment at SD600 (within Fourteen Foot Drain) however, the dataset is currently limited to five data points noting monitoring commenced at this location in 2022. Further monitoring is required to assess whether this is an actual increasing trend or just ongoing variability in concentrations.

Temporal trend graphs for surface water (**Graphs G19** and **G20**), and sediment (**Graphs G29** and **G30**) are presented in **Appendix C**).

8.4 Eastern Region

8.4.1 On-base: Trade Waste Treatment

Groundwater

Decreasing, 'probably decreasing' and 'stable' trends continued to be demonstrated in groundwater at and downgradient of the TWT during the monitoring period. The findings indicate PFAS mass in groundwater is reducing at the TWT area, likely due to a reduction in PFAS mass entering the TWT from base operational areas (e.g. apron areas) following the base-wide transition to Ansulite from legacy AFFF products and targeted PFAS source removal activities in the Former and Current Fire Station area.

As noted in **Section 6.2**, Defence is currently undertaking further characterisation of potential PFAS sources and migration mechanisms in the Eastern Region which includes the TWT area. The outcomes of the study will serve to refine current operations at the MD WTP and inform further source removal and management actions, where appropriate.

Refer to **Graph G13** and **Graph G14** and the relevant Mann Kendall analysis (in **Appendix C** and **Table 28** below).

Table 29 Summary of trend analysis: Trade Waste Treatment

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann Kendall Analysis	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW106S	PFOA	< LOR – 0.02	< LOR – 0.01	*No trend*	78.1%
	PFOS+PFHxS	0.03 – 0.71	0.19 – 0.28	*Stable*	*67.3%*
MW106D	PFOA	< LOR – 0.66	< LOR – 0.06	*Probably Decreasing*	*94.2%*
	PFOS+PFHxS	0.51 – 4.21	0.27 – 2.35	Stable	74.5%
MW208	PFOA	0.09 – 0.92	0.18 – 0.24	*No Trend*	70.1%
	PFOS+PFHxS	8.11 – 29.2	26.4	No Trend	59.6%
MW210S	PFOA	0.03 – 0.19	0.08	*Probably Decreasing*	94.2%
	PFOS+PFHxS	1.32 – 20.6	15.5	Probably Decreasing	90.2%
MW210D	PFOA	< LOR – 0.02	< LOR	Not assessed*	
	PFOS+PFHxS	0.01 – 0.5	0.02	*Decreasing*	100%
MW304	PFOA	0.08 – 0.18	0.33	*No Trend*	62.5%
	PFOS+PFHxS	15 – 26.9	44.40	No Trend	83.3%
MW441	PFOA	0.43 – 2.10	0.02	Probably Decreasing	91.1%
	PFOS+PFHxS	6.80 – 225.20	10.30	Stable	54.8%
MW886	PFOA	0.28 – 0.55	0.20	Not assessed*	

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann Kendall Analysis	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
	PFOS+PFHxS	50.40 – 63.30	68.00	Not assessed*	

Note:

Only one result is reported in the Min-Max Range where the values are the same.

Italics: indicate low confidence in the Mann Kendall trend analysis given concentrations are within 1 to 2 orders of magnitude of the LOR.

* Insufficient sample numbers (less than four results over LOR) at this location to allow for statistical assessment.

Surface Water and Sediment

Previous investigations have determined that groundwater periodically infiltrates the underground portions of the stormwater network providing a direct migration pathway to the surface water environment in Moors Drain.

PFAS impacts at SW001 (base stormwater outflow to the northern branch of Moors Drain) continued to demonstrate a decreasing trend evident since 2021 indicating the MD WTP (located upstream on-base) continues to reduce PFAS impacts in surface water flowing off-base. Impacts in sediment at SD001 continue to demonstrate 'no trend' likely due to the effects of rainfall and ongoing erosion/deposition regimes within the drain.

In contrast, sampling locations SW582 and SW588, located upstream within the eastern region stormwater network continued to demonstrate 'stable' trends indicating PFAS inputs from upstream in the stormwater catchment area remain unchanged.

As noted in **Section 6.2.1**, Defence is currently undertaking further characterisation of PFAS sources and impacts to surface water and groundwater within the Eastern Region of the Base. The study will allow optimisation of MD WTP treatment regime and inform further remedial actions, including source management.

8.4.2 Secondary Management Zone (East)

Groundwater

Groundwater impacts in the Secondary Management Zone to the east of the base are primarily related to the infiltration of PFAS-impacted surface water from Moors Drain into groundwater.

Overall, PFAS concentrations in the area remain stable, with 'decreasing' or 'probably decreasing' trends were identified at several locations proximate to Moors Drain, and closer to the base. These trends suggest that the PFAS plume in this area is unlikely to be expanding.

Continued operation of the MD WTP and further supplementary investigation currently in progress to refine data gaps and improve source management actions on base (refer to **Section 6.2.1**) are anticipated to continue reducing PFAS mass discharge from the Eastern Region to Moors Drain, and therefore to groundwater east of the base.

Refer to **Graph G3** and **Graph G4** and the relevant Mann Kendall analysis (in **Appendix C** and **Table 30** below).

Table 30 Summary of trend analysis: Secondary Management Zone

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann Kendall Analysis	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor
MW123	PFOA	< LOR – 0.04	< LOR – 0.01	*Probably Decreasing*	90.8%
	PFOS+PFHxS	0.10 – 1.93	0.14 – 0.56	Stable	84.8%
MW132I	PFOA	< LOR – 0.02	< LOR	Not assessed*	
	PFOS+PFHxS	0.05 – 1.29	0.23 – 0.26	Decreasing	98.0%
MW132D	PFOA	0.01 – 0.1	0.01 – 0.02	*No Trend*	53.6%
	PFOS+PFHxS	0.07 – 2.33	1.17 – 1.33	No Trend	84.7%
MW161S	PFOA	0.03 – 0.08	< LOR	*Probably Decreasing*	92.9%
	PFOS+PFHxS	2.56 – 4.60	< LOR	Probably Decreasing	91.1%
MW161D	PFOA	< LOR – 0.14	< LOR	*Stable*	88.7%
	PFOS+PFHxS	0.13 – 5.58	< LOR	Probably Decreasing	91.1%
MW247S	PFOA	< LOR – 0.09	< LOR – 0.01	*Decreasing*	99.8%
	PFOS+PFHxS	0.31 – 2.31	0.17 – 1.09	Decreasing	96.8%
MW279S	PFOA	0.01 – 113.00	0.03 – 0.04	No Trend	63.9%
	PFOS+PFHxS	0.71 – 70.30	1.41 – 4.3	No Trend	57.1%

Note:
Only one result is reported in the Min-Max Range where the values are the same.
Italics: indicate low confidence in the Mann Kendall trend analysis given concentrations are within 1 to 2 orders of magnitude of the LOR.
* Insufficient sample numbers (less than four results over LOR) at this location to allow for statistical assessment.

Surface Water and Sediment

PFAS concentrations in Moors Drain (presented in **Graph G21** and **Graph G22**, respectively in **Appendix C**) have fluctuated over time with no consistent trends observed. The results from this monitoring period remained within the historical ranges and no trends were apparent.

PFAS concentrations in Moors Drain continue to fluctuate however appear stable and within historical ranges (presented in **Graph G31** and **Graph G32** in **Appendix C**). It is noted that surface water and sediment PFAS impacts are more susceptible to fluctuation due to variable environmental conditions than groundwater and the lack of trends in these media do not preclude the trends observed in groundwater outlined above.

Notwithstanding, a potential increasing PFOS+PFHxS trend may be present at SD006 in the short-term, however further monitoring is required to assess whether a definitive increasing trend is apparent.

8.4.3 Broader Management Zone (East)

Groundwater

PFAS has typically not been detected in groundwater in the Broader Management Zone east of the base. With the exception of one detection of PFHxS at MW159S, PFAS were not detected above the LOR during the monitoring period in this management zone. Accordingly, trends in historical PFAS concentrations could not statistically assessed and therefore are generally considered ‘stable’ below the LOR.

These results are expected given that the Broader Management Zone (including the Salt Ash area) is outside the known extent of the groundwater plume.

Refer to **Graph G5** and **Graph G6** (in **Appendix C**).

Table 31 Summary of trend analysis: Broader Management Zone

Location ID	Analyte	Historical Range	OMP Events (Current Period)	Mann Kendall Analysis	
		Min – Max (µg/L)	Min – Max (µg/L)	Trend	Confidence Factor

MW232S	PFOA	< LOR	< LOR	Not assessed*	
	PFOS+PFHxS	< LOR	< LOR	Not assessed*	
MW232D	PFOA	< LOR	< LOR	Not assessed*	
	PFOS+PFHxS	< LOR – 0.18	< LOR	Not assessed*	
POT144	PFOA	< LOR	< LOR	Not assessed*	
	PFOS+PFHxS	< LOR – 0.05	< LOR	Not assessed*	

Note:

Only one result is reported in the Min-Max Range where the values are the same.

* Insufficient sample numbers (less than four results over LOR) at this location to allow for statistical assessment.

Surface Water and Sediment

PFAS concentrations in surface water and sediment within Tilligerry Creek remained within the historical ranges during this monitoring period. No consistent trends have been identified in the dataset to date. Surface water data are presented in **Graphs G23** and **G24**, and sediment data presented in **Graphs G34** and **G35** of **Appendix C**.

8.5 Aquatic Biota Results

Aquatic biota sampling was undertaken between 24 January 2024 and 22 April 2024 to target sentinel species in Fullerton Cove that have been identified to accumulate elevated concentrations of PFAS relative to other species.

As summarised in **Section 7.4**, concentrations of PFOS were detected in the biota composite samples, ranging from 0.0036 mg/kg (in Luderick) to 0.012 mg/kg (in School Prawn). The composite samples for Dusky Flathead exceeded the FSANZ 2017 2-6 years Finfish trigger value for PFOS. There were no exceedances of the FSANZ 2017 2-6 Crustaceans for school prawn samples.

PFOS analytical concentrations reported in Luderick, Dusky Flathead and School Prawn collected during the monitoring period were compared to the historical PFOS concentrations reported in the same species between February 2016 and January 2020 in **Table 32**, **Table 33** and **Table 34**.

Note that the aquatic biota data between 2016 and 2017 are in the 2016 Human Health Risk Assessment (HHRA) (AECOM, 2016) and 2017 HHRA (AECOM, 2017b). The 2016 HHRA included aquatic biota samples that were collected and analysed by the NSW Department of Primary Industries (NSW DPI) between September 2015 and March 2016.

The data has been separated to show comparisons to Fullerton Cove only data, and data collected from Fullerton Cove, Raymond Terrace, Tomago, Stockton and Hunter River Port (all locations).

A review of the 2024 and historical PFOS concentrations in aquatic biota caught in Fullerton Cove and surrounding areas, indicated:

- The mean PFOS concentration (0.0074 mg/kg) for dusky flathead in 2024 was above the FSANZ (2017) finfish trigger value of 0.0052 mg/kg (for children aged between two and six years). The mean PFOS concentration reported in 2024 is an order of magnitude less than the mean PFOS level reported in 2022 and 2021. The concentrations of PFOS reported in the 2024 sampling event is below the 2016 DPI mean PFOS concentration (0.023 mg/kg) (AECOM, 2017b), which was used to inform the 2017 HHRA.
- The mean PFOS concentration (0.00375 mg/kg) for luderick in 2024 was below the FSANZ (2017) finfish trigger value of 0.0052 mg/kg (for children aged between two and six years) and consistent with historical concentration ranges. The mean PFOS concentration in 2024 is an order of magnitude lower than the 2016 DPI mean PFOS concentration (0.011 mg/kg) (AECOM, 2017b), which was used to inform the 2017 HHRA.
- The mean PFOS concentration (0.0066 mg/kg) for school prawn in 2024 was below the FSANZ (2017) crustacean (all species) trigger value of 0.065 mg/kg (for children aged between two and six years), and an order of magnitude lower than the mean in 2019.
- Concentrations of PFOS in sampled dusky flathead and luderick have decreased when compared to 2016 data.
- Concentrations of PFOS in sampled school prawn have fluctuated between 2016 and 2022, with the highest concentrations reported in 2021, however still below the FSANZ (2017) crustacean (all species) trigger value (for children aged between two and six years).

Based on the above, the overall conclusions of the 2017 HHRA (AECOM, 2017b) for the off-base area does not require reconsideration.

AECOM concludes that the following conclusions made in the 2017 HHRA (AECOM, 2017b) still apply:

- *“Consumption of low to moderate quantities of locally sourced seafood (including finfish, crabs and prawns) gave rise to low and acceptable risk for residents of the Williamtown Area. There further analysis of biota at that time was not required to inform the HHRA.*
- *Consumption of high quantities of locally sourced finfish was identified as an exposure pathway with potentially elevated or unacceptable risks”*

8.6 Influence of Rainfall

The base and Management Area experienced above average rainfall between April 2024 and June 2024, as outlined in **Section 6.4**. Increased rainfall at the base and surrounds results in an increase in groundwater levels and interaction with surface water which potentially increases migration of PFAS.

However, the potential impacts PFAS migration, measured in the form of first-time detections outside of plume footprints (i.e. within the Secondary Management Zone or Broader Management Zone), or increasing trends were typically not observed in the September 2024 sampling event.

An exception was the first-time exceedance of the drinking water guideline reported at MW270S (0.1 µg/L), located within the Broader Management Zone to the south of the base. It is noted that the PFAS concentrations are variable at this location and possibly influenced by surface water interaction following rainfall events, however additional temporal data and / or investigation into other potential PFAS source areas may be required to assess the reason for the increase. Note that PFOS+PFHxS concentrations were below LOR in April 2024 and 0.04 µg/L in August 2023.

8.7 OMP Trigger Levels Assessment

The OMP (Defence, 2023b) presents a series of trigger levels which were developed to alert Defence and the regulators of any adverse trends in environmental monitoring data. The trigger levels, prescribed responses and commentary on the data set from the monitoring period are summarised in **Table 35**.

Table 35 Trigger levels and responses

Trigger	Response
First-time detection of PFAS in groundwater/surface water	
First-time detections of PFOA, PFOS and/or PFOS+PFHxS for groundwater and surface water during the monitoring period are summarised in **Table 13** and **Table 17**. Below are the wells that reported first-time detections of PFOA: On-base • MW201D (0.05 µg/L, April 2024) • MW340D (0.04 µg/L, April 2024) • MW344D (0.02 µg/L, April 2024) Secondary Management Zone • MW146AD (0.04 µg/L, April 2024) Below are the wells that reported first-time detections of PFOS: Primary Management Zone • MW271D (0.02 µg/L, April 2024) Secondary Management Zone • MW257S (0.01 µg/L, April 2024) Broader Management Zone • MW270D (0.02 µg/L, April 2024) Below are the wells that reported first-time detections of PFOS+PFHxS: Secondary Management Zone • MW257S (0.01 µg/L, April 2024) Broader Management Zone • MW270D (0.02 µg/L, April 2024) There were no first-time detections reported in surface water during the monitoring period.	AECOM reviewed the first-time detections reported during the monitoring period and notes the following: • Concentrations at MW146AD, MW270D and MW271D returned to below LOR in September 2024. • Concentrations at MWW257S returned to below LOR in November 2024 (non-OMP sampling event). • PFOA concentrations reported at MW201D will be assessed in subsequent sampling events. • MW340D and MW344D: limited historical data associated with these locations. Concentrations from September 2024 sampling event were consistent with the April 2024 results. The PFAS concentrations in these monitoring wells will continue to be monitored to confirm results. With the exception of MW257S and MW201D, all locations are monitored on a biannual frequency. It is considered that no changes to the current monitoring frequencies for the above locations are warranted. AECOM notes that there are no changes to the CSM or associated risk profile due to the currency of the NSW Government's precautionary advice for each management zone.

Trigger	Response
First time exceedance of the drinking water guideline in groundwater	
New exceedances for PFOA and/or PFOS+PFHxS of drinking water guidelines in groundwater during the monitoring period are summarised in **Table 13**. Below are the wells that reported new exceedances of drinking water guidelines for PFOA: Primary Management Zone • MW731D (0.58 µg/L, April 2024) • MW731S (0.59 µg/L, April 2024) Below are the wells that reported new exceedances of drinking water guidelines for PFOS+PFHxS: Broader Management Zone • MW270S (0.1 µg/L, September 2024)	AECOM reviewed the first-time exceedances reported during the monitoring period and notes the following: • MW731S and MW731D: limited historical data associated with these locations. Concentrations from September 2024 sampling event were consistent with the April 2024 results. • The sample from MW270S was reanalysed, and the exceedance was confirmed. The rolling average over a three-year period (2022-2024) for PFOS+PFHxS results from MW270S (0.03 µg/L) remain below the drinking water guidelines. AECOM notes that there are no changes to the CSM or associated risk profile due to the currency of the NSW Government's precautionary advice for each management zone. The PFAS concentrations in these monitoring wells will continue to be monitored to confirm results. It is considered that no changes to the current monitoring frequencies for the above locations are warranted.
New exceedance in groundwater of the groundwater exposure point concentration (EPC) used in the Off-Site HHRA (AECOM, 2017b) for the relevant Risk Zone (refer to Appendix H): **Risk Zone A – PFOS+PFHxS: 190.3 µg/L** **Risk Zone B – PFOS+PFHxS: 5.67 µg/L** **Risk Zone C/D – PFOS+PFHxS: 0.05 µg/L**	
The Risk Zone is displayed in groundwater analytical tables (in both **Table T5** in **Appendix B** and in **Table E1** in **Appendix E**). The Risk Zones are displayed on **Figure F19** of **Appendix H**.	-

Trigger	Response
There were no new exceedances of the groundwater EPC for PFOS+PFHxS (AECOM, 2017b) in groundwater samples collected from Risk Zone A, Risk Zone B and Risk Zone C & D during the monitoring period.	
First time exceedance in surface water of the surface water EPC for 95th percentile used in the Off-Site HHRA (AECOM, 2017b): • **Marine Water – PFOS: 1.78 µg/L, PFHxS: 1.48 µg/L** • **Region 1 – PFOS: 5.035 µg/L, PFHxS: 1.666 µg/L** • **Region 2 – PFOS: 1.47 µg/L, PFHxS: 1.009 µg/L** • **Region 3 – PFOS: 7.743 µg/L, PFHxS: 6.773 µg/L**	
The Regions referred to in the Off-base HHRA are displayed in surface water analytical tables (in both **Table T6** in **Appendix B** and in **Table E2** in **Appendix E**). The Regions are displayed on **Figure F2** of **Appendix H**. There were no new exceedances of the surface water EPC for PFOS and PFHxS (AECOM, 2017b) in surface water samples collected from Marine Water, Region 1, Region 2 and Region 3 during the monitoring period.	-
First time exceedance of the recreational water guideline in surface water	
New exceedances for PFOA and/or PFOS+PFHxS of recreational water guidelines in surface water during the monitoring period are summarised in **Table 17**. There were no new exceedance of recreational guidelines for PFOA and/or PFOS+PFHxS reported in surface water samples collected during the monitoring period.	-
Sediment PFAS (i.e. Sum of PFAS) concentration increase* in two consecutive sampling events ***(where increases in two consecutive sampling events were also above historical maximums)**	
There were no Sum of PFAS concentration increases in two consecutive sampling events(were also above historical maximums) in sediment samples collected during the monitoring period.	-

Trigger	Response
Increasing PFAS trends	
Groundwater • On-base FFTA: - MW108S (PFOS+PFHxS*) - MW172 (PFOA, PFOS+PFHxS) • On-base South of Lake Cochran: - MW175D (PFOA, PFOS+PFHxS) • On-base Former and Current Fire Station: - Nil • On-base Trade Waste Treatment: - Nil • Primary Management Zone: - MW126S (PFOA*, PFOS+PFHxS) - MW178 (PFOS+PFHxS) - MW271S (PFOS+PFHxS) - MW731S (PFOA, PFOS+PFHxS) • Secondary Management Zone: - Nil • Broader Management Zone: - Nil. Insufficient sample numbers (less than four results over LOR) at monitoring locations to allow for statistical assessment	The increasing trends in PFAS concentrations in groundwater on-base and off-base within the Primary Management Zone (at the leading edge of the central plume) are not unanticipated based on groundwater modelling and as a result do not change the CSM or associated risk profile. Note that Mann-Kendall analysis was not used to assess PFAS trends in concentrations in surface water and sediment given that variables such as rainfall, which influence PFAS concentrations, are not factored into the analysis. Notwithstanding, analytical results and temporal trends in these datasets have been reviewed against the CSM, and assessment criteria, with risk profiles for each monitoring location updated where required.
Decreasing PFAS trends	
Groundwater • On-base FFTA: - MW166 (PFOA, PFOS+PFHxS) - MW167 (PFOA, PFOS+PFHxS) - MW168 (PFOS+PFHxS)	The decreasing concentrations on-base in the vicinity of areas where Defence has undertaken PFAS remediation / management actions are not unexpected and as such do not change the CSM or associated risk profile. The reason for the localised decreasing PFAS concentrations in MW132I and MW247S within the Secondary Management Zone is currently unknown. While

Trigger	Response
- MW169D (PFOA, PFOS+PFHxS) - MW169S (PFOA, PFOS+PFHxS) - MW281S (PFOA, PFOS+PFHxS) - MW282S (PFOS+PFHxS*) • On-base South of Lake Cochran: - MW109D (PFOS+PFHxS*) - MW466 (PFOS+PFHxS) - MW468 (PFOA, PFOS+PFHxS) • On-base Former and Current Fire Station: - MW196 (PFOA, PFOS+PFHxS) - MW201S (PFOS+PFHxS*) - MW202S (PFOS+PFHxS) • On-base Trade Waste Treatment: - MW106D (PFOA*) - MW210S (PFOA*, PFOS+PFHxS*) - MW210D (PFOS+PFHxS) - MW441 (PFOA*) • Primary Management Zone: - Nil • Secondary Management Zone: - MW132I (PFOS+PFHxS) - MW247S (PFOA, PFOS+PFHxS) • Broader Management Zone: - Nil. Insufficient sample numbers (less than four results over LOR) at monitoring locations to allow for statistical assessment	these locations will continue to be monitored, there is no change to the CSM or associated Risk Profile given that the NSW Governments precautionary advice continues to apply to both locations.

Trigger	Response
No triggers or acceptable levels are exceeded	
Exceedances of the triggers or acceptable levels were reported for: • First time detections of PFAS in groundwater and surface water • First time exceedance of the drinking water guideline in groundwater • Increasing PFAS trends • Decreasing PFAS trends	Continue monitoring of all locations as per the OMP.

Notes: Risk Zones and Regions as defined in the HHRA (AECOM, 2017b), detailed below.

- **Marine Water:** various water bodies such as those associated with Port Stephens and Hunter River (i.e. Fullerton Cove for the purpose of the OMP)
- **Region 1**: the area east of the base, generally following Moors Drain and discharging at the tidal portion of Tilligerry Creek.
- **Region 2**: the area along Tilligerry Creek southeast of the base which discharges in the tidal portion of Tilligerry Creek
- **Region 3**: the surface water drainage network south of the base, which predominantly discharges at Fullerton Cove.
- **Risk Zone A** is defined by the footprint of the Southern Area, which includes a portion of Region 3.
- **Risk Zone B** is defined by the footprint of the Eastern Area, which includes a portion of both Region 1 and Region 3.
- **Risk Zone C** is defined by that portion of the footprint of the remaining area, which corresponds with Region 1 and Region 3.
- **Risk Zone D** is defined by that portion of the footprint of the remaining area, which corresponds with Region 2.
- Asterisk (*) indicates a trend was determined as Probably Increasing or Probably Decreasing

9.0 Conceptual Site Model

The updated PMAP (Defence, 2023a) provides a revised CSM summarising the linkages between sources, exposure pathways and receptors.

The OMP sampling events over the monitoring period have provided additional data to further understand the changing conditions of the PFAS concentrations in groundwater, surface water, sediment and biota.

Although some localised changes were noted to the plume extents on-base as a result of remediation activities, the PFAS transport mechanisms and the general extent of the plume (size and shape) are inferred to remain similar to that reported previously.

Groundwater remains the primary pathway for PFAS migration from the base. The ongoing treatment of groundwater at the Western Region (FFTA), and Central Region (Area south of Lake Cochran) coupled with previous source removal (excavation) activities at the sources in these areas, have reduced the localised PFAS concentrations in groundwater at the base. However, the on-base source-pathway-receptor (SPR) linkages identified in the CSM remain unchanged. PFAS-impacted groundwater continues to migrate south from these source areas beyond the base boundary and SPR linkages for off-base areas remain unchanged.

Surface water drainage, including interaction between surface water drains and groundwater, remains the other a significant pathway for PFAS migration from the base. The key drainage channels that drain surface water from the base to off-base areas include:

- Western and Central Regions: Dawsons Drain and Leary's Drain and (indirectly) Fourteen Foot Drain and Ten Foot Drain to the southwest of the base, which discharge to Fullerton Cove. Groundwater is known to upwell into Dawsons Drain and Leary's Drain, providing a direct migration pathway for PFAS-impacted groundwater to enter these drainage lines and Fullerton Cove beyond.
- Eastern Region: Moors Drain which receives runoff from the on-base piped stormwater drainage network and discharges to Tilligerry Creek. Notably the on-base stormwater network within the Eastern Region is known to interact with the shallow groundwater and provides a direct migration pathway for PFAS impacted groundwater to enter the off-base surface water environment at Moors Drain.

Despite the sandy, porous nature of the soils in the Management Area, heavy rainfall can exceed the soil infiltration rate, resulting in ponding and/or runoff on the surface and flooding, and influence the migration of PFAS into downstream sediments. Given the shallow depth to groundwater, it is also likely that these occurrences, which are transient, represent water table outcrop. Concentrations of PFAS in sediment have fluctuated over time however generally remain within the same order of magnitude as historical ranges.

No significant changes to the SPR linkages and migration mechanisms identified for surface water and sediment were apparent during the monitoring period.

The current CSM is presented in **Table 36** below and illustrated as a conceptual schematic figure in **Appendix I**.

Table 36 Conceptual Site Model

Primary Sources	Secondary Sources	Transport Mechanisms	Exposure Pathways	Exposed Population Characterisation / Receptor	Exposure pathway complete?	Risk	Risk Management
On-base areas where fire-fighting retardants/ suppression foams (primarily AFFF) have been discharged or released to the environment. PFAS soaks into soil and/or infrastructure from where it can be eroded as sediment or leached by rainwater or flood water and migrate to groundwater, or dissolve in surface water runoff and potentially travel to affect other media.	PFAS in shallow soil (<1.9 m).	Water and wind erosion of soil and atmospheric dispersion of soil and dust. Excavation and re-location of soil during construction activities.	Human health: direct contact with PFAS in soil during intrusive works (i.e. excavations)	Commercial/ Intrusive maintenance workers	Potentially complete	Potential for exposure to occur under incidental ingestion of soil and direct contact with soil (including during intrusive works) with concentrations of PFOS+PFHxS above the adopted commercial/industrial land use screening criteria (on-base source areas).	The potential risks associated with direct contact with PFAS in soils are effectively managed by existing administrative controls (required for all excavation works on-base), OHS practices and personal protective equipment (PPE)
			Ecological: Flora - direct contact with, root uptake from PFAS in soil. Fauna - ingestion of PFAS in soil and ingestion of plants which may have taken up PFAS from the soil.	On-base flora and fauna.	Complete	Reported concentrations of PFOS in surface soils, have the potential to pose an unacceptable risk to ecological receptors due to direct and indirect contact.	Ongoing remediation to reduce PFAS levels at the base. Restricting access for fauna to PFAS impacted areas on base through engineering controls (i.e. fencing)
	PFAS in groundwater.	Groundwater transport in shallow aquifer.	Human health: Direct contact with groundwater (indoor and outdoor use); via extraction from bore, irrigation spear points (on and off-base).	Commercial/ Intrusive maintenance workers	Potentially complete	Potential for exposure to occur should indirect or direct contact with concentrations of PFAS in groundwater above relevant criteria.	On-base: Managed by provision of potable water and OHS practices.
				Residential	Potentially complete*	Potential for elevated exposure to occur under typical[2] and upper[3] scenarios in Risk Zone A (refer to Appendix H). The severity is variable[1] and dependant on the type and number of pathways	Off-base: Managed by provision of an alternative water supply and ongoing management via the NSW Government precautionary advice.
	PFAS in surface water.	Surface water transport; in drains and on ground surface on and off-base.	Ecological (on and off-base): Toxicity to flora and fauna from direct exposure to PFAS in surface water.	Ecosystem (on-base and off-base).	Complete	Reported concentrations of PFOS in surface water were above 90% species protection criteria in all waterways except Fullerton Cove. The Ecological Risk Assessment (ERA) (AECOM, 2018) noted that there was the potential for unacceptable risks to native flora and fauna associated with direct contact and/or consumption of PFAS impacted surface water	Ongoing management of surface water to reduce PFAS discharges from the base. The potential risks associated with direct contact with PFAS in sediment and surface water in on-base drains and water bodies are effectively managed by existing administrative controls (required for all maintenance works on-base), OHS practices, PPE and off-base via the NSW Government precautionary advice.
			Human Health: Direct contact with surface water (on-base commercial workers, off-base recreational)	Commercial / Recreational	Potentially complete*	Elevated concentrations of PFOS in surface water within on-base and off-base drains and surface water bodies	
	PFAS in sediment.	Dispersion via surface water or via drain maintenance activities.	Ecological (on and off-base): Direct contact of terrestrial and aquatic organisms to PFAS in sediment.	Ecosystem (on-base and off-base).	Complete	Reported concentrations of PFOS in sediment (on-base drains and Dawsons Drain/ Moors Drain) have the potential for unacceptable risks to aquatic organisms.	
			Human Health: Direct contact with PFAS in sediment for commercial workers (on base)	Commercial	Potentially complete	Elevated concentrations of PFOS in sediment within on-base drains and surface water bodies	

Primary Sources	Secondary Sources	Transport Mechanisms	Exposure Pathways	Exposed Population Characterisation / Receptor	Exposure pathway complete?	Risk	Risk Management
	PFAS in pore water in sediments.	Surface water transport; in un-lined drains and as surface flow on-base and off-base.	Ecological (on and off-base): Direct contact of terrestrial and aquatic organisms to PFAS in surface water.	Ecosystem (on-base and off-base).	Complete	Reported concentrations of PFOS in surface water were above 90% species protection criteria in all waterways except Fullerton Cove. The ERA (AECOM, 2018) noted that there was the potential for unacceptable risks to native flora and fauna associated with direct contact and/or consumption of PFAS impacted surface water	
	Home grown produce.	Uptake of PFAS in soil / water by biota	Human health: Consumption of home grown produce (including fruit and vegetables, chicken eggs).	Residential	Potentially complete*	Potential for elevated exposure to occur under typical[2] and upper[3] scenarios in Risk Zones A, B, C and D when eating eggs from home grown backyard poultry that have consumed soil or plants that have accumulated PFAS from irrigation water. Potential for elevated exposure to occur when eating vegetables that have been in irrigated or flooded with water containing detectable PFAS concentrations, under: • typical[2] and upper[3] scenarios in Risk Zone A (refer to Appendix H). • upper[3] scenarios in Risk Zone B (refer to Appendix H). The severity is variable[1] and dependant on the type and number of pathways .	Ongoing management via the NSW Government precautionary advice.
	Aquatic biota.	Uptake of PFAS in sediment / water by aquatic biota	Human health: Ingestion of aquatic organisms (including fish and shell fish).	Residential/ Commercial fishers	Potentially complete*	Potential risk of harm to human health from consumption of high quantities of locally sourced finfish, including dusky flat head, luderick, silver biddy and mulloway. Potential for elevated exposure to occur for commercial fishers under upper[3] scenarios in marine environment.	Ongoing management via the NSW Government precautionary advice.

Notes:

* = Pathway considered to be potentially complete for this receptor; however, management measures are currently in place to reduce the potential for exposure via this pathway. Management measures include precautions to minimise exposure recommended by NSW Government (consistent with the 2017 HHRA), and provision of an alternative water supply to eligible stakeholders by Defence.

1. Combined with other exposure pathways, this has the potential to result in overall exceedances of the tolerable daily intake (TDI). Exceeding the TDI does not mean that health effects will occur, and there is currently no conclusive evidence that exposure to PFAS will lead to health effects in humans.
2. ‘Typical’ represents typical and average exposure scenarios for majority of the population.
3. ‘Upper’ represents receptors that undertake activities at a higher frequency or ingestion, therefore apply to a small percentage of the population.

10.0 Risk Profile Review

10.1 Risk Assessment Summary

The HHRA (AECOM, 2017b) and the ERA (AECOM, 2018) assessed the potential off-base human health and environmental risks resulting from exposure to base derived PFAS in soil, sediment, groundwater and / or surface water.

The data collected during OMP monitoring between January 2024 and December 2024 indicates that the risk profile to human health and ecological receptors within the Management Area as presented in the HHRA, ERA and the PMAP (Defence, 2023a) remains unchanged. This is based on the following assessment of OMP data, particularly with reference to the OMP trigger levels assessment outlined in **Section 8.7**.

It is noted that potential PFAS exposure for land users within the Williamtown Management Area via water use and locally sourced food consumption, is managed through NSW Government Precautionary Advice which currently remains in place.

10.2 Human Health Risk Assessment

The exposure pathways where potential risks were identified as elevated in the HHRA (AECOM, 2017b) were as follows:

- Drinking groundwater (including use in cooking) where the average PFAS concentration exceeds the drinking water guidelines (FSANZ, 2017).
- Incidental ingestion of groundwater when used indoors for showering or bathing or food preparation.
- Incidental ingestion of groundwater when used outdoors (including filling swimming pools and children's wading pools, sprinkler play and domestic irrigation).
- Incidental ingestion of surface water during recreational activities (including swimming in creeks and/or drains).
- Eating home grown vegetables.
- Eating eggs from backyard poultry.
- Eating home grown red meat.
- Drinking milk from home grown cattle or using it in cooking.
- Eating high quantities of locally sourced finfish.

The current data set collected under the OMP does not indicate that there is a change in the identified HHRA exposure pathways described above.

10.3 Ecological Risk Assessment

The exposure pathways where potential risks were identified as elevated in the ERA (AECOM, 2018) were as follows

- Ingestion of PFAS impacted soil, sediment or surface water by ecological receptors.
- Ingestion of organisms that have been exposed to PFAS where bioaccumulation is occurring, including aquatic and terrestrial organisms.

The current data set collected under the OMP does not indicate that there is a change in the identified ERA exposure pathways described above.

11.0 Conclusions

Groundwater, surface water, sediment, and aquatic biota sampling was completed as part of the OMP between January 2024 and December 2024. The following conclusions are based on the data collected during the monitoring period.

PFAS Plume Characteristics

Overall, the concentrations of PFAS in groundwater were generally similar to previous results. In several upper and mid-plume locations on-base ‘decreasing’ or ‘probably decreasing’ trends were identified, indicating that targeted treatment of on-base source areas has and continues to remove PFAS mass from the environment and mitigate replenishment of PFAS plumes.

At some monitoring locations downgradient of the plume fronts increasing trends were identified suggesting the cores of the plumes continue to migrate away from on-base source areas. However, PFAS concentrations and the shape of the groundwater plume in the Primary and Secondary Management Zones, including Salt Ash area to the east of the base, were generally stable.

The overall extent of the off-base plume remains relatively consistent with the extents identified in the 2017 ESA (AECOM, 2017a).

Conceptual Site Model and Risk Summary

The CSM was reviewed, and no changes were identified to PFAS sources, pathways or receptors at the base and off-base Management Area.

While there have been localised changes in PFAS concentrations during the monitoring period, the risks profiles associated with exposure to PFAS in groundwater, surface water and sediment, and as described in the HHRA (AECOM, 2017b), have not changed and no review of exposure assumptions is required.

The potential PFAS exposure of land users off-base, within the Williamtown Management Area, regarding water use and locally sourced food consumption is currently managed through NSW Government Precautionary Advice and remains in place.

Remediation Progress

- The three water treatment plants on-base removed approximately 4.7 kg of PFAS from the environment (groundwater and surface water) during this monitoring period.
- The decrease in concentrations of the northern portion of the Western Region is likely to be attributable to the soil remediation and ongoing groundwater treatment at the FFTA.
- The Lake Cochran Passive Barrier system trial was successful under controlled conditions and ongoing performance will be monitored under the OMP scheme.
- Defence is also planning to implement additional management actions to target the western plume and central plume, and potentially upgrade the Moors Drain water treatment plant, it is estimated that these proposed additional works will reduce PFAS flux entering the environment by around 30 kg per year.
- Whilst remediation progress continues across the base, the management of risks to PFAS continues to be undertaken in accordance with the actions outlined in the PMAP.

Notes:

1. At least four independent sampling events per well are required for calculating the trend. *Methodology is valid for 4 to 40 samples.*
2. Confidence in Trend = Confidence (in percent) that constituent concentration is increasing (S>0) or decreasing (S<0): >95% = Increasing or Decreasing; ≥ 90% = Probably Increasing or Probably Decreasing; < 90% and S>0 = No Trend; < 90%, S≤0, and COV ≥ 1 = No Trend; < 90% and COV < 1 = Stable.
3. Methodology based on "MAROS: A Decision Support System for Optimizing Monitoring Plans", J.J. Aziz, M. Ling, H.S. Rifai, C.J. Newell, and J.R. Gonzales, *Ground Water* , 41(3):355-367, 2003.

NSW GOVERNMENT

Williamtown Management Area Map

The Williamtown Management Area comprises three zones:

- **Primary Management Zone –** this area has significantly higher levels of PFAS and therefore the strongest advice applies.
- **Secondary Management Zone –** this area has some elevated levels of PFAS.
- **Broader Management Zone –** the topography and hydrology of the area means PFAS detections could occur now and into the future.

Each zone has tailored precautionary advice for residents to minimise exposure to PFAS originating from the RAAF Base Williamtown.

The map is based on many sources of information, including:

- The Defence Human Health Risk Assessment monitoring data (released 5 December 2017)
- The location of drainage lines, creeks and other surface water features
- The height of land above sea level
- The location of property boundaries and roads
- Surface water and groundwater flow information based on actual measured data, and modelled data for where contamination may flow in the future.

The map also shows drains leading from the Primary Management Zone (marked as dark blue arrows) and Moors Drain in the Secondary Management Zone (marked with a blue line). The precautionary advice for the area in which the drain is located applies.

Following feedback from the community, the EPA has been working with a group of water experts and the Williamtown Community Reference Group to improve the maps for the various management zones:

- Property boundaries have been overlaid to easily identify individual properties.
- Names of main roads have been included for easy reference
- The three zones within the Management Area are now identified by three shades of blue, representing the concentrations of PFAS detected. This also improves ease of access for visually-impaired people.
- There are now three close-up versions of Fullerton Cove, Williamtown and Salt Ash

Appendix E

Data Deviations

Table E1 - Historical Groundwater Analytical Results and Deviations
