PFAS OMP data in 2024 monitoring period

Any historical data identified as anomalous in the databse is not displayed in this table.

Table E2 - Historical Surface Water Analytical Results and Deviations

									PFAS Results and Deviations							
									PFOA	PFOA Deviations	PFOS	PFOS Deviations	PFHxS	PFHxS Deviations *(only for surface water EPC for 95th percentile)*	PFOS+ PFHxS	PFOS+PFHxS Deviations
									µg/L		µg/L		µg/L		µg/L	
LOR									0.002		0.002		0.002		0.01	
PFAS NEMP 2020 Recreational Water									**10**						**2**	
PFAS NEMP 2020 Freshwater 99%									*19*		*0.00023*					
Location Code	**Date**	**Field ID**	**Sample Type**	**Project ID**	**On-base/Management Zone**	**Region**

1.0 Introduction

1.1 Preamble

AECOM Australia Pty Ltd (AECOM) has prepared this Sampling and Analysis Quality Plan (SAQP) for the implementation of the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) at RAAF Base Williamtown (the 'base') and the surrounding off-base areas, including the Williamtown Management Area (refer to **Figure 1** in **Appendix A**).

The SAQP supports the *PFAS Ongoing Monitoring Plan – November 2023, RAAF Base Williamtown* (Defence, 2023a), here-in referred to as OMP (Defence, 2023a).

The purpose of the OMP (Defence, 2023a) is to collect data that will enable Defence to maintain an up to date understanding of the distribution, concentration, transport (migration pathways and rates) and transformation of PFAS at the base and Williamtown Management Area.

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PFAS Management Area Plan (PMAP) (Defence, 2023b).

Note that the initial three-year monitoring period was completed in June 2022, and this SAQP covers the upcoming sampling event that completes the two-year extension period, between July 2022 and June 2024.

1.2 SAQP Objectives

The objectives of this SAQP are to:

- define the proposed scope of works in detail
- outline the proposed sampling methodology to be adopted
- outline the proposed quality assurance and quality control (QA/QC) measures to be adopted
- define the data collection requirements for the project.

1.3 Scope of Works

To meet the objectives, the following scope of works are proposed as per the OMP (Defence, 2023a):

- monitor the nature and extent (spatial and temporal) of PFAS impact in groundwater, surface water, sediment and biota pathways associated with PFAS sources on the base derived from the historical use of aqueous film forming foam (AFFF)
- monitor the migration of PFAS in groundwater and surface water from the base, utilising newly obtained and historical data
- provide confirmation of the current understanding of risk
- provide supporting data for assessment of management actions, where relevant.

1.4 Guidelines and Legislation

The SAQP has been developed with reference to the following guidelines and legislation:

- Australian and New Zealand Guidelines, 2018. *Australian and New Zealand Guidelines for Fresh and Marine Water Quality*
- Department of Defence, 2018. *Contamination Management Manual – Annex L Data Management*. August 2018, Amended June 2021
- Department of Defence, 2022. *PFAS Investigation and Management, Guidance Document E Standard PFAS Analytical Suite*. June 2022

D R A F T

- Department of Health (DoH), 2017. *Health Based Guidance Values for PFAS for use in site investigations in Australia*. April 2017. This document is based on the works undertaken by Food Standards Australia New Zealand (FSANZ) in 2017 (FSANZ 2017)
- Heads of EPAs Australia and New Zealand (HEPA) 2020. *PFAS National Environmental Management Plan 2.0*. January 2020
- National Environment Protection Council (NEPC), 2013. *National Environment Protection (Assessment of Site Contamination) Measure 1999 (as amended 2013)*
- National Health and Medical Research Council (NHMRC), 2019. *Guidance on PFAS in Recreational Water.* August 2019
- Standards Australia, 1998. AS/NZ 5667:1998 Water Quality – Sampling. Part 11: Guidance on sampling of groundwaters.

1.5 Background

The previous investigations carried out at the base prior to the implementation of the OMP include the Environmental Site Assessment (ESA) (AECOM, 2017a), the Off-Site Human Health Risk Assessment (HHRA) (AECOM, 2017b) and the Ecological Risk Assessment (ERA) (AECOM, 2018). These reports detailed the nature and extent of PFAS at the base and its associated risks, to both human and ecological receptors from sources of PFAS contamination related to legacy use of AFFF at the base.

The 2019 PMAP (Defence, 2019) was subsequently developed, and outlined the overall purpose and requirements of the OMP (AECOM, 2019a to 2019c).

To date, the following reports have been prepared under the previous OMP (AECOM, 2019a to 2019c):

- 21 OMP Sampling Event Factual Reports, as well as other flood or surface water specific event reports (AECOM, 2020a to 2020c, 2021b to 2021m, 2022a, 2022b, 2022d, 2023b, 2023c, 2024a, 2024b)
- three OMP Ongoing Monitoring Reports (AECOM, 2021a, 2022c and 2024c).

In 2023, Defence completed a review of the OMP following the initial three-year monitoring period, and the findings were provided in the OMP Review Report (AECOM, 2023a), which led to the development of an updated OMP (Defence, 2023a) in consultation with the New South Wales Environment Protection Authority (NSW EPA).

Since the 2019 PMAP, Defence has implemented much of the plan and reassessed what is now needed to best manage the contamination risks. The PMAP was updated in 2023 (Defence, 2023b), that sets out the updated plan to manage risks to human health and the environment from exposure to PFAS contamination.

D R A F T

2.0 Site Setting

2.1 Site Description

The base is located on Medowie Road, approximately 15 km north of the City of Newcastle, in a rural and semi-rural setting. The base is an active airbase and occupies an area of approximately 800 ha and comprises 'landside' and 'airside' areas:

- landside areas are partially covered by hardstand and pavement consisting of concrete, asphalt roadways, and contain a large number of low-rise buildings, accommodation properties, workshops, aircraft hangars, fuel storage areas and storage facilities
- airside areas consist of taxiways, aprons and the main runway.

The base is located within the Tomago Sandbeds, with Newcastle Airport and rural residential properties located at the southern boundary. The base is located within the Port Stephens Council Local Government Area.

In November 2017, the NSW Government released the map of the Williamtown Management Area (refer to **Appendix B**), which comprises three zones that have been defined by the NSW government:

- **Primary Management Zone** – this area has significantly higher levels of PFAS detected and, therefore, the strongest precautionary advice applies
- **Secondary Management Zone** – this area has some detected levels of PFAS
- **Broader Management Zone** – the topography and hydrology of the area means PFAS detections could occur now and into the future.

The NSW government noted that each zone has tailored precautionary advice for residents to minimise exposure to PFAS coming from the base.

2.1.1 Regional Meteorology

The Bureau of Meteorology (BoM) RAAF Base Williamtown (station number 061078), located on-base, recorded data since 1942 to current day, presenting a record of approximately 82 years. The following is a summary of temperature and rainfall data for this period:

- mean monthly maximum temperatures have varied from 17.2°C in July to 28.3°C in January
- mean rainfall at the base is 1,124.7 mm per annum. The lowest recorded annual rainfall was 541.0 mm in 1980 and the highest annual rainfall was 1,793.7 mm in 1963. The highest monthly rainfall generally occurs between February and June (averaging approximately 117 mm per month), with the lowest rainfall in July to December (averaging approximately 74 mm per month).

The temperature and rainfall data for recent monitoring events is summarised below:

- mean monthly maximum temperature was 20.3 °C in May 2023 and 25.7 °C in November 2023
- total monthly rainfall was 86.6 mm in May 2023 and 65.4 mm in November 2023.

2.1.2 Topography and Geology

The Management Area is situated in an area associated with the Lower Hunter River. Its topography is dominated by dune systems to the north-north-west and the Stockton Dunes to the south-east, with flat, low-lying former swamp lands between.

The region is generally low lying and characterised by low sand dunes, sand sheets and estuarine mud flats. The topography is relatively flat with ground elevation ranging between approximately 10 m Australian Height Datum (m AHD) at the north of the base and approximately 2 m AHD in the south, near Fullerton Cove. A low lying, flat topography characterises the areas between Fullerton Cove and Tilligerry Creek with elevations between 1 and 3 m AHD.

The base and the majority of the northern half of the Management Area are underlain by the Tomago Sandbeds. The southern/ south-western parts of the Management Area are underlain by the Stockton Sandbeds. The geology of the Management Area can be divided into the following main features:

D R A F T

- basement rocks formed during the Late Permian period
- unconsolidated deposits formed during the Pleistocene (Tomago Sandbeds) and Holocene (Stockton Sandbeds) periods, under marine, beach, back barrier, aeolian and estuarine environments
- Holocene estuarine sediments deposited between the unconsolidated sand deposits (i.e.Tilligerry Mud Member).

2.1.3 Hydrogeology

The hydrogeology of the Lower Hunter region is characterised by two unconfined sand aquifers which occur in the Tomago Sandbeds and the Stockton Sandbeds. PFAS source areas on the base are located on the Tomago Sandbeds and PFAS migration in groundwater appears to occur principally within that aquifer. Further migration of the PFAS plume appears to be restricted by the north-westerly groundwater flow of the Stockton Sandbeds and by the presence of the confining effects of the Tilligerry Mud Member.

Aquifer recharge is predominately from rainfall, with groundwater levels fluctuating markedly in response to rainfall patterns. Recharge of the aquifer has been reported to be at about 30% of the mean annual rainfall. The aquifers support several groundwater dependent ecosystems including wetlands and terrestrial vegetation.

The Tomago Sandbeds aquifer is within a ‘special requirements area’ due to its strategic importance to Hunter Water Corporation (HWC). HWC operates a borefield network of over 500 individual bores within the Tomago Sandbeds aquifer that are connected to pumping stations.

Within the Management Area there are more than 300 groundwater bores located on private land, the majority of which are inferred to draw water from shallow depths in the Tomago Sandbeds.

2.1.4 Vegetation

The base consists of approximately 240 ha of remnant native vegetation. The remnant native vegetation consists of the following dominant vegetation types (AECOM, 2018):

- broad-leaved Paperbark / Swamp Mahogany
- smooth-barked Apple / Red Bloodwood Open Forest
- Scribbly Gum Open Forest
- isolated mature Drooping Red Gum trees.

The base is surrounded on three sides (west, north and east) by the Tilligerry State Conservation Area (TSCA). The base and the TSCA are located on the Tomago Sandbeds which provide habitat to a variety of coastal vegetation communities, including the following (AECOM, 2018):

- Clay Wallum Scrub
- Earp’s Gum Sedge Woodland
- Paperbark-Apple-Mahogany Dry Swamp Forest
- Scribbly Gum-Apple-Bloodwood Forest
- Scribbly Gum-Bloodwood Wallum Woodland
- Swamp Mahogany Forest
- Tomago Blackbutt-Apple-Bloodwood Forest.

2.1.5 Surface Water Drainage

Surface water drainage at the base occurs via a number of sub catchments controlled by topography and a complex network of open and buried drains, discharging to the western/ southern boundary (to

D R A F T

Dawsons Drain) and the eastern boundary of the base (to Moors Drain). Drainage patterns within the base continue to be modified by on-going redevelopment works.

The shallow groundwater table across the base fluctuates in response to rainfall conditions. On-base drains may gain (receive) groundwater when the groundwater table is elevated or lose (soak) to groundwater when the groundwater table is lower. It appears that the on-base piped stormwater drainage network interacts with the shallow groundwater.

A large proportion of surface runoff from central and western areas of the base is collected by Lake Cochran, which is considered to be a source of localised groundwater recharge.

Key drainage channels that receive surface water from the base include Dawsons Drain, Moors Drain, and (indirectly) Fourteen Foot Drain and Ten Foot Drain to the south-west of the base, which discharge towards the Fullerton Cove Ring Drain and hence Fullerton Cove via tidal gates.

2.1.6 Current Surrounding Land Use

The current land uses of the surrounding off-base areas include the following:

- a mix of commercial/ industrial activities adjacent to the southern boundary of the base. This area is likely to expand over the coming years as demand increases at Newcastle Airport
- a mix of residential and rural residential holdings with some agricultural properties
- Tilligerry State Conservation Areas to the west, north and east
- Hunter Water Corporation lands to the west
- sand mining and quarry operations to the west of the base on Cabbage Tree Road.

2.2 Conceptual Site Model

The Conceptual Site Model (CSM) is presented in the PMAP (Defence, 2023b) which summarises the linkages between sources, exposure pathways and receptors, which was based on the assessments of risk exposure pathways.

The CSM identified key primary PFAS source areas (where AFFF containing PFAS is understood to have been used or disposed of in the past) and secondary PFAS source areas (where PFAS has migrated to a location where it creates a concentration of impact). Additional monitoring and investigation has improved the understanding of these source areas to inform the management requirements. The key sources are as follows:

- Western Region - characterised by the Former Fire Training Area (FFTA) source that is now remediated, and a PFAS groundwater plume extending south away from the source.
- Central Region - characterised by ongoing sources at the Former Fire Training Pad / Current Fire Station (Facility 165) and the Sewage Treatment Plant (Facility 410); with PFAS groundwater plumes extending south across the base boundary.
- Eastern Region - characterised by likely sources at the Trade Waste Treatment Plant (Facility 480) and a Former Fuelling Area, with PFAS groundwater plumes extending east across the base boundary, and PFAS impacted surface water discharges to Moors Drain.

The concentrations of PFAS south of the site and north of Cabbage Tree Rd were likely sourced from Lake Cochran, which was impacted when AFFF foams were still in use at the base. However, Lake Cochran is no longer considered a significant ongoing PFAS source to groundwater. PFAS in the central southern plume discharges into Leary's and Dawsons Drain.

The HHRA (AECOM, 2017b) considered potential PFAS exposure pathways that could contribute to overall PFAS exposure. These pathways included consideration of human health risks to identified off-base human receptors as a result of exposure to elevated PFAS concentrations reported in soil, groundwater, surface water, sediment, terrestrial biota and seafood within the Management Area (excluding the base). The HHRA (AECOM, 2017b) concluded that if people within the Williamtown Management Area follow the NSW Government precautionary advice, their exposure to PFAS is unlikely to exceed the tolerable daily intake.

D R A F T

The exposure pathways with elevated PFAS exposure, included but not limited to:

- drinking groundwater (Management Area)
- incidental ingestion of groundwater from indoor use (Primary Management Zone) and outdoor use (Primary and Secondary Management Zones)
- eating home produced eggs, beef and milk (Management Area)
- eating home grown vegetables (Management Area)
- eating high quantities of locally sourced finfish (Hunter River Estuary, Fullerton Cove and Tilligerry Creek)

Ecological receptors who may be exposed to PFAS via the following:

- toxicity to terrestrial and aquatic organisms from direct exposure to PFAS in soil, sediment or surface water. Applies to drains in Management Area, including Dawsons Drain and Moors Drain
- consumption of organisms that have been exposed to PFAS where bioaccumulation is occurring.

D R A F T

3.0 Data Quality Objectives

3.1 DQO Process

The amended National Environmental Protection Measure (NEPM, Schedule B [2]) *Guideline on Site Characterisation* (2013) specifies that the nature and quality of the data produced in an investigation will be determined by the Data Quality Objectives (DQOs). As referenced by the NEPM, the DQO process is detailed in the United States Environmental Protection Agency (US EPA) *Guidance on Systematic Planning Using the Data Quality Objectives Process (EPA QA/G-4: EPA/240/B-06/001), February 2006.*

The US EPA defines the process as *'a strategic planning approach based on the Scientific Method that is used to prepare for a data collection activity. It provides a systematic procedure for defining the criteria that a data collection design should satisfy, including when to collect samples, where to collect samples, the tolerable level of decision errors for the study, and how many samples to collect'.*

The process of establishing appropriate DQOs is defined according to the following seven steps:

Table 1 The seven steps in defining DQOs

Step	Data Quality Objective Step
1	**State the problem** – Define the problem that necessitates the study; identify the planning team, examine budget, schedule.
2	**Identify the goal of the study** – State how environmental data will be used in meeting objectives and solving the problem, identify study questions, define alternative outcomes.
3	**Identify information inputs** – Identify data and information needed to answer study questions.
4	**Define the boundaries of the study** – Specify the target population and characteristics of interest, define spatial and temporal limits, scale of inference.
5	**Develop the analytic approach** – Define the parameter of interest, specify the type of inference, and develop the logic for drawing conclusions from findings.
6	**Specify performance or acceptance criteria** – Develop performance criteria for new data being collected or acceptable criteria for existing data being considered for use.
7	**Develop the plan for obtaining data** – Select the resource-effective sampling and analysis plan that meets the performance criteria.

The approach adopted relative to the seven steps presented above is discussed below.

3.1.1 Step 1 – State the Problem

Defence and State agencies require up-to-date data to enable informed risk management decisions to protect human health and the environment, given that elevated concentrations of PFAS have been identified in environmental media.

Defence requires an understanding of the holistic effect of PFAS management response activities that have and will be implemented.

The data collected by implementing this OMP (Defence, 2023a) will provide a detailed dataset that can be used to assist with assessment of temporal changes in PFAS concentrations in groundwater, surface water and sediment on- and off-base, and biota (sentinel species) in Fullerton Cove. This will facilitate refinement of the CSM, allow update of the human health and ecological risk assessment and inform management decisions by Defence and NSW EPA, and possibly other government agencies, if required.

Additionally, the temporal monitoring of PFAS concentrations in selected biota aims to provide data necessary to support and/or update the ongoing advice relating to minimising exposure (e.g. consumption of seafood).

D R A F T

3.1.2 Step 2 – Identify the Decision / Goal of the Study

The goal of the study is to establish a systematic routine groundwater, surface water, sediment and biota sampling and analysis program to provide current and on-going information on the distribution of PFAS (contaminants of potential concern) in groundwater, surface water, sediment and biota.

The information can be utilised by Defence and State agencies. The key issues are:

1. What is the optimum monitoring well network, surface water / sediment and biota locations that can be sampled to meet the objectives of the OMP?
2. What is analytical suite for each monitoring well / sampling point?
3. What frequency of sampling required?
4. Are the laboratory Limits of Reporting (LOR) appropriate for the objectives of the OMP?
5. Are the reported concentrations similar, greater than or less than those previously reported?
6. Are the concentration trends increasing, decreasing or stable?
7. If the concentrations of contaminants are found to be outside of an acceptable range, what actions should be implemented?
8. If the concentrations of contaminants are found to be inside a trigger value or acceptable range, what actions should be implemented?
9. Are the data reliable and adequate to enable informed decisions to be made by Defence / State agencies?
10. Is the approach scientifically suitable and defensible?

3.1.3 Step 3 – Identify Information Inputs

To allow assessment of the data against the study goal listed in Step 2 above, the following inputs will be considered:

- PFAS results from previous environmental investigations
- Meteorological data including rainfall
- Previous data collected during the implementation of the 2019 OMP
- Data collected during PFAS remediation management activities
- Groundwater, surface water, sediment and biota data collected and analysed for PFAS, as part of this OMP (Defence, 2023a)
- Advances in laboratory analytical approaches and changes in regulatory requirements.

3.1.4 Step 4 – Define the Boundaries of the Study

The spatial and temporal boundaries that apply for data collection are detailed below and will influence the decision-making process for ongoing monitoring:

- The spatial boundary for data collection is the base and Management Area
- The sampling completed as part of the OMP will be limited to groundwater, surface water, sediment and biota, at the frequencies defined in **Section 4.2**
- The monitoring will be ongoing.

The OMP has covered the initial four year monitoring period (November 2019 – November 2023) of the PMAP and will continue after the remediation / management actions have ended. This is the timeframe over which PMAP remediation actions (or other short-medium term actions) have been completed, and the monitoring following this period will be assessed with advice from NSW Government.

The OMP will also cover the extended implementation period to the extent required by specific characteristics of the base and surrounds and behaviour of the plume, measured against specified data trends.

D R A F T

3.1.5 Step 5 – Develop the Analytical Approach

The decision rules can be defined as:

- Analytical selection; all samples will be analysed for PFAS standard analytical suite at the standard limit of reporting (LOR)
- Analytical method selection for PFAS is based on achieving appropriate laboratory LOR in the various media to be analysed
- Sample locations have been selected with the objective of monitoring PFAS trends (temporal and seasonal), providing early warning of changes in the migration of PFAS in surface water and groundwater
- If the laboratory QA/QC data are within the acceptable ranges, the data will be considered suitable for use
- If PFAS concentrations are reported above the laboratory LOR, where it was previously <LOR, then it will be considered whether further assessment of the data will be required
- If the PFAS is reported at a concentration that is above drinking water guideline in groundwater, where it was previously below the adopted screening criteria value, then it will be considered that further assessment is required and / or notification
- If the PFAS is reported at a concentration that is above recreational use water guideline in surface water, where it was previously below the adopted screening criteria value, then it will be considered that further assessment is required and / or notification
- If the PFAS is reported at a concentration that is inside a trigger value or acceptable range, then it will be considered whether monitoring is continued or reduced, **this assessment will be undertaken after two years of monitoring.**

The decision on the acceptance of the analytical data should be made on the basis of the Data Quality Indicators (DQIs) as follows:

- **Precision:** A quantitative measure of the variability (or reproducibility) of data
- **Accuracy**: A quantitative measure of the closeness of reported data to the “true” value
- **Representativeness**: The confidence (expressed qualitatively) that data are representative of each media present on base
- **Completeness**: A measure of the amount of useable data from a data collection activity
- **Comparability**: The confidence (expressed qualitatively) that data may be considered to be equivalent for each sampling and analytical event.

3.1.6 Step 6 – Specify Performance or Acceptance Criteria

Specific limits for the works included in the OMP (Defence, 2023a) are in accordance with the appropriate guidance made or endorsed by state and national regulations, appropriate indicators of data quality, and standard procedures for field sampling and handling.

This step also examines the certainty of conclusive statements based on the available new data collected. This should include the following points to quantify tolerable limits:

- A decision can be made based on a certainty assumption of 95% confidence in any given data set. A limit on the decision error will be 5% that a conclusive statement may be a false positive or false negative
- A decision error in the context of the decision rule presented above would lead to either underestimation or overestimation of the risk level associated with a particular sampling area
- Sampling errors may occur when the sampling program does not adequately detect the variability of a contaminant from point to point across the base. To address this, the OMP outlines minimum numbers of samples proposed to be collected from each media

D R A F T

- As such, there may be limitations in the data if aspects of the OMP cannot be implemented. Some examples of this scenario include but are not limited to:
  - proposed surface water sample locations may be dry at the time of sampling
  - proposed groundwater well locations are damaged or destroyed and therefore cannot be sampled
  - proposed samples are not collected due to access being restricted to a given location.
- Limitations in ability to acquire useful and representative information from the data collected. The data are proposed to be collected from multiple locations and sample media. An example of this scenario includes:
  - Some of the data are proposed to be collected from landholder bores, which are not purpose-built for groundwater monitoring. In some cases, there is limited information on the bore construction, and the likely presence of dedicated pumps may prevent groundwater depths being accurately recorded while also preventing groundwater being sampled using HydraSleeves™.
- Measurement errors can occur during sample collection, handling, preparation, analysis and data reduction. To address this the following measures are proposed:
  - Collection of sufficient sample mass to facilitate analysis reported to standard laboratory detections limits. Collection of insufficient sample mass may result in raised detection limits
  - Field staff to follow a standard procedure when collecting samples, including decontamination of tools, and use of appropriate sample containers and preservation methods
  - Laboratories to follow a standard procedure when preparing samples for analysis and undertaking analysis
  - Laboratories to report QA/QC data for comparison with the DQIs established for the OMP (Defence, 2023a).

3.1.7 Step 7 – Optimise the Design for Obtaining Data

The methodology presented in this SAQP is designed to meet the Project objectives and to achieve the nominated DQOs. Optimisation of the data collection process will be achieved by:

- Working closely with the analytical laboratories and sampling equipment suppliers to ensure that appropriate procedures and processes are developed and implemented prior to and during the fieldwork, to ensure that sample handling, and transport to and processing by the analytical laboratories is appropriate
- Conducting sampling according to Australian Standards for the type of sampling being conducted (i.e. groundwater monitoring well sampling versus landholder bore water sampling). This standard is: Standards Australia (AS/NZS5667.11–1998) *Water Quality – Sampling, part 11: Guidance on sampling of groundwater*
- Basing the sampling upon a CSM developed using the information available at the implementation of the OMP (Defence, 2023a). Updating the CSM as new data becomes available in the course of the implementation of the OMP (Defence, 2023a), as required.

If the objectives of the OMP (Defence, 2023a) are not being met, the sampling design and approach will be reviewed and amended, as required.

3.2 Assessment of Data Quality

The quality of data collected as part of the sampling will be assessed on a range of factors including:

- documentation and data completeness; and

D R A F T

- data quality – comparability, representativeness, precision and accuracy of the analytical data.

The project target for data completeness is to achieve 95% of data as suitable for use. The acceptance criteria for DQIs for samples are specified in **Table 2**.

Table 2 Acceptance Criteria for Data Quality Indicators for Sample Analysis

Data Quality Indicators (Water and Sediment Samples)	**Acceptance Criteria**
Field Program	Sampling to be completed by suitably qualified and experienced field teams employing appropriate sampling procedures.
Rinsate Blanks	Rinsate blank samples are to be collected at a rate of one per day of sampling (where sampling equipment is reused). Concentrations of PFAS should be less than the laboratory LOR.
Field duplicates/Inter-laboratory duplicates	Field duplicates and inter-laboratory duplicates are to be collected and analysed at a rate of 10% (1 per 10 primary samples). The relative percentage differences (RPD) will be assessed as acceptable if less than or equal to 30% as per the NEPM Schedule B3. Where the results show greater than 30% difference a review of the cause will be conducted (NEPM, 2013). It is noted that RPDs that exceed this range may be considered acceptable where: • results are less than 10 times the LOR (no limit) • results are between 10 and 20 times the LOR and the RPD is less than 50% • heterogeneous materials are encountered.
Laboratory duplicates	The RPD will be assessed as acceptable based on the magnitude of the result: • 0-20% for results more than 20 times the LOR • 0-50% for results between 10 and 20 times the LOR • No limit for results between 0 and 10 times the LOR
Matrix spikes	Recoveries between 70-130% of the theoretical recovery or as nominated in the laboratory's Quality Control report.
Method blanks	Less than the laboratory LOR.
Laboratory control samples	Recoveries between the laboratory-specified range for each particular analyte/analytical suite.

D R A F T

4.0 Sampling Location Rationale and Methodology

4.1 OMP

The OMP (Defence, 2023a) presents an overview of specific monitoring works to be undertaken and provides the basis for the preparation of this SAQP. This scope of works presented in this SAQP is consistent with that detailed in the OMP (Defence, 2023a).

4.2 Proposed Schedule

The key element of the OMP (Defence, 2023a) is six monthly groundwater, surface water and sediment sampling on- and off-base, and biota sampling biennially (every two years). This includes:

- An autumn comprehensive sampling and analysis event for the first of the biannual groundwater, surface water and sediment sampling events timed to occur in March / April
- A spring targeted sampling and analysis event for the second of the biannual groundwater, surface water and sediment sampling events timed to occur in September / October to target key monitoring wells
- Biota sampling for sentinel species in Fullerton Cove to occur every second year.

The rationale for these elements is summarised below:

- The six-monthly monitoring to occur:
    - **Autumn** (March / April), during high average rainfall period (128 mm for March and 109 mm for April) based on Bureau of Meteorology (BoM) Williamtown RAAF weather station (number 061078); and
    - **Spring** (September / October), during low average rainfall period (60 mm for September and 76 mm for October) based on BoM.

  It is considered that relatively higher contamination concentrations may occur in groundwater and surface water systems during the high average rainfall periods due to the effects of higher infiltration rates through the unsaturated zone which may mobilise contaminants.
- The monitoring event targeting low average rainfall period will increase the understanding of changes in PFAS concentrations in groundwater at discrete locations, considered to be of importance for understanding trends (for example bores close to source areas, base boundaries and creek systems), or locations with higher sensitivity (groundwater sample locations with concentrations close to screening criteria, areas with fewer monitoring locations).

The schedule of fieldworks under the OMP (current and previous) is presented in **Table 3** below.

Table 3 Fieldwork Schedule

Sampling Round No.	Description of works	Proposed Schedule
1	Biannual groundwater, surface water, sediment and soil sampling	November 2019 (Completed)
2	Biota sampling	January 2020 (Completed)
3	Annual groundwater, surface water, sediment and soil sampling	May 2020 (Completed)
4	Flood water sampling	July 2020 (Completed)
5	Biannual groundwater, surface water, sediment and soil sampling, surface water max flux baseline sampling	November 2020 (Completed)
6	Surface water mass flux event	December 2020 (Completed)

D R A F T

Sampling Round No.	Description of works	Proposed Schedule
7	Surface water mass flux event	January 2021 (Completed)
8	Biota sampling	February 2021 (Completed)
9	Annual groundwater, surface water, sediment and soil sampling	May 2021 (Completed)
10	Biannual groundwater, surface water, sediment and soil sampling	November 2021 (Completed)
11	Biota sampling	February 2022 (Completed)
12	Annual groundwater, surface water, sediment and soil sampling	May 2022 (Completed)
13	Biannual groundwater, surface water, sediment and soil sampling	November 2022 (Completed)
14	Annual groundwater, surface water, sediment and soil sampling	May 2023 (Completed)
15	Biannual groundwater, surface water and sediment sampling	November 2023 (Completed)
16	Biota sampling	January to April 2024 (Completed)
17	Annual groundwater, surface water and sediment sampling	April 2024 (Completed)
18	Biannual groundwater, surface water and sediment sampling	September 2024

4.3 Sampling Locations

4.3.1 Groundwater Sample Location Rationale

Groundwater monitoring will be undertaken on selected monitoring wells, Hunter Water bores and residential bores. The OMP (Defence, 2023a) will monitor water quality in the shallow and deep portions of the Tomago Sandbeds aquifer. The current understanding of the CSM is that PFAS concentrations in the intermediate groundwater (approximate depth of 12 m bgs) are similar to that of the deeper portions (approximate depth of 20 m bgs) of the aquifer, and hence will not be targeted.

The rationale for monitoring well selection for each area is summarised in **Table 4** below.

D R A F T

Table 4 Groundwater Sample Location Rationale

Area	Rationale
On-base	• Monitor spatial and temporal variations in PFAS concentrations in groundwater concentrations up, down and gross-gradient of source areas • Monitoring of PFAS concentrations in groundwater within and downgradient of the source areas to assess change in response to management measures over time • Monitoring of HWC assets that are in close proximity to the PFAS plume to inform risk to a potential drinking water supply • Monitoring of sentinel wells for Pump Station 7 located on-base • Monitoring of PFAS concentrations in groundwater within the on-base Moors Drain Catchment, targeting elevated PFAS concentrations detected during recent PFAS characterisation studies. • Continue to monitor groundwater wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitoring of groundwater on transects parallel and perpendicular to plume, and at shallow and deep portions of the aquifer to assist with understanding concentrations changes in the nominated transect alignments.
East of base	• Monitor spatial and temporal variation in PFAS concentration in groundwater up and down hydraulic gradient of HWC asset Pumping Station 9 • Continue to monitor groundwater wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitor potential changes in PFAS concentrations at the plume margins to refine model predictions and provide an indication of additional management of PFAS to groundwater users outside the current plume • Monitor groundwater adjacent to Moors Drain to assess PFAS migrating from the drain to groundwater • Monitor groundwater on transects parallel and perpendicular to the plume, and at shallow and deep portions of the aquifer to assist with understanding concentration changes in the nominated transect alignments.
West of base	• Monitor the western edge of the plume in relation to HWC asset Pumping Station 5 at sentinel locations • Monitor the movement of PFAS from the former Fire Training Area (FFTA) towards southern boundary (within the Demolition of Explosive Munitions Site (DEMS) Area) • Monitor groundwater wells on transects parallel and perpendicular to plume, and at shallow and deep portions of the aquifer to assist with understanding concentrations changes in the nominated transect alignments.

D R A F T

Area	Rationale
Southern Area	• Monitor potential changes in PFAS concentrations at the plume margins in the Southern Area (Primary Management Zone) to refine model predictions • Continue to monitor groundwater wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitor groundwater on transects parallel and perpendicular to plume, and at shallow and deep portions of the aquifer to assist with understanding concentrations changes in the nominated transect alignments.
Cabbage Tree Road	• Monitor potential changes in PFAS concentrations to refine model predictions and provide an indication of additional management of PFAS to groundwater users outside the current plume • Continue to monitor the isolated detections of PFAS in groundwater that have been considered to be associated with unconfirmed mechanisms. This may include transport of PFAS via surface water, flooding or an unidentified source • Continue to monitor wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitor groundwater on transects parallel and perpendicular to plume, and at shallow and deep portions of the aquifer to assist with understanding concentrations changes in the nominated transect alignments.
Lavis Lane	• Monitor the plume to the south east of the base and in the Lavis Lane area • Monitor groundwater adjacent to Fourteen Foot Drain • Monitor potential changes in PFAS concentrations at the plume margins to refine model predictions and provide an indication of additional management of PFAS to groundwater users outside the current plume • Continue to monitor wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitor groundwater on transects parallel and perpendicular to plume, and at shallow and deep portions of the aquifer to assist with understanding concentrations changes in the nominated transect alignments.
Salt Ash	• Monitor the isolated detections of PFAS in groundwater in Salt Ash that have been considered to be associated with unconfirmed mechanisms. This may include transport of PFAS via surface water, flooding or an unidentified source • Monitor potential changes in PFAS concentrations at the plume margins to refine model predictions and provide an indication of additional management of PFAS to groundwater users outside the current plume • Continue to monitor wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitor groundwater on transects perpendicular to the plume, and at shallow and deep portions of the aquifer to assist with understanding concentrations changes in the nominated transect alignments.

D R A F T

Area	Rationale
Fullerton Cove	• Monitor the isolated detections of PFAS in groundwater that have been considered to be associated with unconfirmed mechanisms. This may include transport of PFAS via surface water, flooding or an unidentified source • Monitor potential changes in PFAS concentrations to refine model predictions • Continue to monitor wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations.

4.3.2 Groundwater Sampling Locations

The groundwater locations to be monitored on a biannual (six-monthly) and/or annual basis are provided in **Table 5** below and are presented on **Figures 1** to **4** in **Appendix A**.

D R A F T

Table 5 Groundwater Monitoring Locations

On/Off-Base	Area	Location ID	Historical Name	Easting	Northing	Top of Casing Elevation (m AHD)	Screen Interval (mbgl)	Sampling Frequency	Total
On-Base	Former & Current Fire Station (Facility 165)	MW196	-	391067.540	6371029.000	6.760	0.8 - 3.8	Annual	7

D R A F T

4.3.3 Surface Water Sampling Locations

The surface water monitoring locations have been selected to maintain consistency with the monitoring completed during the implementation of the 2019 OMP (AECOM, 2019), and address the requirements of the NSW Government and provide additional data to assess temporal variability.

Four additional locations (SW333, SW582, SW588, SW600) were added within Dawsons Drain, Moors Drain and Fourteen Foot Drain.

The locations to be monitored on a biannual (six monthly) basis are provided in **Table 6** below and are presented on **Figures 1** to **4** in **Appendix A**.

Table 6 Surface Water Monitoring Locations

D R A F T

4.3.4 Sediment Sampling Locations

Sediment sampling will be undertaken at the locations where surface water samples are collected as defined in **Section 4.3.3**.

The sediment sampling locations have been selected to maintain consistency with the monitoring completed during the implementation of the 2019 OMP (AECOM, 2019a) and address the requirements of the NSW Government and provide additional data to assess temporal variability. Two additional locations (SD333, SD600) were added within Dawsons Drain and Fourteen Foot Drain.

The locations to be monitored on a biannual (six-monthly) basis are provided in **Table 7** below and are presented on **Figures 1** to **4** in **Appendix A**.

Table 7 Sediment Sample Locations

On/Off-Base	Area	Location ID	Historical Name	Easting	Northing	Total

D R A F T

Note: Historical Name, Eastings and Northings are sourced from the Defence Esdat database. Some coordinates are not displayed for privacy reasons.

4.3.5 Biota Sampling Locations

Sampling will continue to target sentinel species in Fullerton Cove (refer to **Figure 1** in **Appendix A**) as per the previous OMP (AECOM, 2019) that were identified to accumulate elevated concentrations of PFAS relative to other species, namely:

- Dusky Flathead (Platycephalus fuscus)
- Luderick (Girella tricuspidata)
- School Prawn (Metapenaeus macleayi).

A description of these species is provided in **Table 8** below.

Table 8 Aquatic Biota Description

Species	Description
Finfish	
Dusky Flathead (Platycephalus fuscus)	• Dusky Flathead PFAS levels in the Hunter River were considered to be elevated relative to other species, variable and did not follow spatial patterns evident in the other species • Dusky Flathead is a target recreational and commercial species.
Luderick (*Girella tricuspidata)*	• Found primarily in estuaries and around nearshore rocky reefs • Spawning occurs in surf zones near estuary entrances during winter, the larvae then enter estuaries and small juveniles live in sheltered shallow water habitats. Adults are mainly found in association with weedy habitats such as seagrass and rocky reefs. Adults migrate to near-coastal waters prior to spawning and may then return to estuaries • Mainly herbivorous, feeding on seagrass and green algae, and sometimes small invertebrates • Mature around 25 cm. Minimum legal length is 27 cm • Important recreational species, minor commercial species.
Crustacea	
School Prawn (*Metapenaeus macleayi*)	• Inhabit estuaries and inshore ocean waters • Spawn in near shore ocean waters between December and May. Post-larval prawns enter estuaries and move upstream. Following spring the adolescent prawns return down-stream and migrate to sea to mature and spawn • Prefer soft, muddy substrates and areas of seagrass • Eat a variety of small invertebrates and detritus • Maximum length 16 cm • Important domestic market.

It is noted that not all species above may be present at Fullerton Cove during the sampling event.

The aquatic biota monitoring locations are to be monitored on a biennial (every second year) basis. A summary of the sample numbers is provided in the **Table 9**.

Table 9 Summary of sample numbers

Species	Number of Composite Samples per Event	Total No. of Individual Samples for each Composite
Dusky Flat Head	4	Up to 10
Luderick	4	Up to 10
School Prawn	4	Up to 10

D R A F T

4.4 Sample Collection and Handling

4.4.1 Sampling Methodology

The sampling methodology is presented in **Table 10**.

Table 10 Groundwater Sampling Methodology and Schedule

Item	Details
Groundwater gauging	The depth to groundwater will be measured in each monitoring well prior to collection of groundwater samples. Additionally, during each sampling event a gauging round of selected groundwater locations will be conducted to enable groundwater contours to be developed. The selected locations for the targeted gauging event are as follows: • **shallow wells**: MW106S, MW122, MW123, MW124, MW125S, MW126S, MW146S, MW162S, MW188S, MW232S, MW247S, MW256S, MW257S, MW260S, MW268S and MW897S • **deep monitoring wells**: MW106D, MW125D, MW126D, MW146AD, MW162D, MW188D, MW232D, MW247D, MW256D, MW257D, MW260D, MW268D and MW897D.
Groundwater Sample Collection Methodology	**Groundwater Monitoring Wells** Groundwater samples will be collected from monitoring wells using no-purge methodology with HydraSleeves™ which will be installed within the screened interval of the wells. Care should be taken to avoid placing the base of the HydraSleeves™ at the base of the monitoring well, where a build-up of sediment may be present. The installation depth of the HydraSleeves™ is to be recorded (generally as HydraSleeve™ collar depth in metres below top of casing (mbTOC)). HydraSleeves™ are to be installed / deployed in monitoring wells for a minimum of 4 hours prior to sampling, when deployed with bottom weights only, and for a minimum of 24 hours prior to sampling, when deployed with both top and bottom weights, to allow re-stabilisation of the well following disturbance, and if applicable, for the top weight to compress. Following sampling, water quality parameters are recorded ex-situ, from any excess water available in the HydraSleeve™. In the event that a HydraSleeve™ fails to deploy or has been removed inadvertently (i.e. by a non-OMP project), the sample will be collected using a dedicated disposable high-density polyethylene (HDPE) bailer, if time or access constraints do not permit re-deployment of the HydraSleeve™ and subsequent sampling in the same sampling event. When sampling with a bailer, a minimum of three well volumes should be purged and purging should be continued until stabilisation of water quality parameters (to be collected continuously ex-situ) is achieved. If recharge is insufficient during purging, care will be taken to avoid purging the well dry and collecting the sample when reasonable to do so. Once sampling is completed, a new HydraSleeve™ will be deployed at the screened interval depth at each location in preparation for the next scheduled sampling round, where practicable. HydraSleeve™ sampling will be completed in accordance with the manufacturer's guidance. Due to narrow PVC of monitoring wells MW842 and MW844, groundwater samples will be collected using a peristaltic pump. MW829 is a non-traditional well with no well cap or gatic (pump station bore/sampling point) and will be sampled using a bailer. **Residential Bores**

D R A F T

Item	Details
	Bore water samples will be collected by placing the laboratory provided sample bottle beneath the tap outlet and the tap slowly opened to collect the “first flush” of water. Following sampling, water quality parameters will be recorded ex-situ, by placing the water quality meter (WQM) probe in a cup filled with bore water from the tap outlet.
Surface Water Sample Collection Methodology	Surface water samples will be collected in accordance with the ASC NEPM (NEPC, 2013) and PFAS NEMP (HEPA, 2020). Samples will be collected from either mid-way through the water column or approximately 0.5 m below the surface (if possible) using a ‘grab’ sample method, without disturbing the bottom of the surface water body and without capturing any surface film, to minimise collection of sediment, or floating materials in the samples. At each location, a new, laboratory supplied container should be lowered into the water with the cap immediately applied once the container is full. Where sampling points cannot be accessed safely, surface water samples will be collected with use of a sampling pole. Description of each sampling location will be recorded (including physical setting, flow observations, presence of sheen or foam etc).
Sediment Sample Collection Methodology	Sediment samples will be collected in accordance with the ASC NEPM (NEPC, 2013) and PFAS NEMP (HEPA, 2020). Sediment samples are to be collected from a depth representative of potentially deposited sediments and collected from within the water body, if possible. Where embankment stability and surface water depth permits, sediment samples will be collected using a hand trowel to a maximum depth of 0.3 m below the sediment surface. Where access to sediment is restricted by bank instability or the presence of surface water, samples will be collected using a hand auger or Dormer Piston Sediment Sampler. A new laboratory supplied container will be used at each location for collection of samples, and any reusable sampling equipment utilised will be de-contaminated between locations. Description of each sampling location and the sample material will be recorded.
Biota Sample Collection Methodology	Samples will be captured utilising the following process, similar to the previous methodology adopted during the 2019 OMP, and undertaken in accordance with the appropriate permits and ethics approval: Boats will be used to deploy mesh netting. Nets will be placed over night in the target locations and will be collected the following morning. Observations on the number of target species captured, bycatch and water quality will be recorded. Bycatch will be returned to the water, where possible. A prawn trawler will be used to trawl a net throughout the target area. At the end of each sampling run the net will be inspected. Observations on the number of target species captured, bycatch and water quality will be recorded. Bycatch will be returned to the water, where possible. All target specimens will be retrieved from the nets, euthanised, then prepared for processing to the laboratory. Target fish will be euthanized by blunt force trauma, followed by exsanguination. No compositing will be undertaken in the field. Four composite samples shall be collected per event, per target species. Each composite sample will comprise of up to 10 individual specimens and will be prepared at the laboratory under the laboratory’s supervision. In addition to the

D R A F T

Item	Details
	composite samples, one fillet from each fish will be retained and frozen for future analysis should information on individual variation (or linking of PFAS concentrations to biological attributes such as growth, sex etc.) be required at a later date. A detailed methodology for the collection of biota samples is presented in the Standard Operating Procedure for Aquatic Biota Sampling (**Appendix C**).
QA/QC Samples to be Collected	For water and sediment matrices, field QA/QC samples are to include intra-laboratory duplicate and inter-laboratory duplicate samples (i.e. blind and split duplicates), as well as rinsate blank samples, as specified in **Section 4.12**. AECOM will collect extra sample volume to enable the laboratory to complete their internal QA/QC analysis. AECOM personnel will attempt to reduce potential heterogeneity in the sample media matrix by dividing the sample collected between primary and intra-laboratory jars or bottles during sampling. For biota matrices, no duplicate sampling is proposed as the samples are being composited. Individual specimens of the composite samples will be retained to validate composite results as required.
Field Parameters	Temperature, electrical conductivity (EC), dissolved oxygen (DO), Redox (reduction-oxidation), pH and observations of water quality will be recorded for all groundwater and surface water samples, including: • physical indicators such as the presence (and approximate proportion) of suspended solids, colour • the presence/absence and nature of odours and the presence/absence of slicks or sheens on water.
Sample Analysis	All primary samples will be submitted for the standard PFAS analytical suite using the standard levels of detection. For biota matrices, all composites will be prepared at the laboratory under the laboratory's supervision and will be tested for standard PFAS analytical suite using the standard levels of detection. Biota sample preparation by the laboratory includes removal of scales/shell, head and internal organs. Fillets will be taken with skin intact and homogenised prior to sub-sampling and analysis.

4.4.2 Decontamination of sampling equipment

To avoid cross-contamination between samples and sample locations, all reusable sampling equipment, such as interface probe and trowel, will be de-contaminated between locations. The proposed method of decontamination is summarised below:

- preliminary wash and scrub with tap water, after each sampling location
- wash using Liquinox®
- rinsed with tap water
- rinsed with deionised water (supplied by the laboratory).

Clean, disposable nitrile gloves will be worn and replaced between each sample.

4.4.3 Sample Handling and Transport to Laboratory

All samples will be placed on ice in eskies immediately after sampling. All water and moist sediment samples should be kept, where possible, at low temperatures (≤6°C) during transit to the laboratory, in accordance with ASC NEPM (NEPC, 2013).

D R A F T

Samples will be transported directly to the laboratory for analytical testing under standard chain of custody (CoC) procedures. Primary and associated duplicate QA/QC samples will be analysed by Australian Laboratory Services (ALS). The inter-laboratory duplicate samples will be analysed by Envirolab Services (Envirolab). For biota matrices, samples will be analysed by the National Measurement Institute (NMI).

4.5 Calibration

The calibration of the water quality meter (WQM) will be tested each day via a “bump test” prior to the commencement of field activities with relevant solutions, including pH, EC and Redox. The calibration will be in accordance with manufacturers’ instructions or National Association of Testing Authorities (NATA) publication “General Requirements for Registration: Supplementary Requirement: Chemical Testing (NATA 1993) and Technical Note N0. 19 (NATA 1994)”. Where satisfactory calibration cannot be achieved, the water quality data will not be used for interpretive purposes.

Calibration details will be recorded on field sheets and included in the Sampling Event Factual Reports for each sampling round.

4.6 Logistics

The laboratory sample containers will be shipped from the laboratory to the AECOM office in Sydney or Newcastle prior to the commencement of fieldwork. All samples will be transported by field staff or couriered directly to the relevant laboratory, at the completion of fieldwork. All inter-laboratory duplicate samples will be submitted under a separate CoC for analysis.

4.7 Analytical Suite and Laboratory Analysis Methods

4.7.1 Laboratory NATA Accreditation Details

The laboratory is required to use NATA accredited methods based on NEPM, US EPA, Table B 15 of the US Department of Defence/Department of Energy and American Society for Testing and Materials (ASTM) methods as appropriate.

The primary and secondary laboratories selected for this program are ALS (NATA Accreditation Number 825), NMI (NATA Accreditation Number 198), and Envirolab (NATA Accreditation Number 2901).

4.7.2 Analytical Schedule

All media sampled will be analysed for the standard PFAS analytical suite in accordance with the Defence (2022) *Standard PFAS Analytical Suite - Guidance Document E* (**Appendix D**).

The current standard laboratory LOR for the primary laboratories are described in **Table 11** below.

Table 11 Laboratory Limits of Reporting

Sample Media	Parameter	Technique/Method Reference	LOR
Water	Extended PFAS Suite	LCMS	0.01 – 0.1 µg/L
Sediment	Extended PFAS Suite	LCMS	0.0002 – 0.001 mg/kg
Biota	PFAS (full suite)	AUTLO7 Reference methods USEPA537/821	0.0003 – 0.001 mg/kg

LCMS = Liquid chromatography mass spectrometry

4.7.3 Validation of Analytical Results

Validation of analytical results may be required in the form of re-analysis by the reporting laboratory or through re-sampling and analysis, to confirm original results.

The requirement for re-sampling and/or re-analysis will be determined in consultation with Defence and will generally apply to results that are first-time detections of PFAS in water matrices, new exceedances of human health guidelines or consecutive increases of PFAS concentrations in sediments.

D R A F T

4.8 Sample Nomenclature

In order to meet Defence data management requirements, a consistent sample nomenclature has been adopted for the Program. All primary samples will be labelled using the following naming convention:

PPPP_XX000_ZZZ_YYMMDD

[property ID]_[type of sample][THREE DIGIT sample number]_[top of sample depth]_[yearmonthday]

e.g. 0908_MW001_240515

Location types and codes are prescribed by the Defence Contamination Management Manual, Annex L Data Management (Defence, June 2021) and the Site's investigation history.

Location types relevant to this SAQP include:

- MW = monitoring well
- SW = surface water
- SD = sediment
- BIOAFA = biota aquatic fauna (school prawn, dusky flathead, luderick).

QA/QC Samples will be labelled in accordance with the following convention:

- blind duplicate (intra-laboratory duplicate): PPPP_QC1XX_YYMMDD
- split duplicate (inter-laboratory duplicate): PPPP_QC2XX_YYMMDD
- rinsate blank: PPPP_QC3XX_YYMMDD.

4.9 Defence ESdat Requirements

Defence has contracted Earth Science Information Systems (EScIS), to provide contamination data management services through a cloud instance of its Esdat product.

All field and laboratory data collected by AECOM will be uploaded, stored and managed in Defence's Environmental Data Management System (EDMS (ESdat)) in accordance with Section 6 of Annex L to the Defence Contamination Management Manual. AECOM will refer to historical investigation data to ensure consistent location codes are used to enable analysis of data trends. Where required under Annex L, non-compliant location codes will be resolved under direction from Defence.

AECOM will ensure that electronic data deliverables (EDDs) from the laboratory include required information for automatic upload into the EDMS, such as including the correct Project ID in Esdat files and including the Defence ESdat auto-upload email address (DERP.LabReports@esdat.com.au) in the laboratory report recipient list.

AECOM will ensure that field data is uploaded, and laboratory data is uploaded and approved into the EDMS and that QA/QC data is correctly reconciled for each monitoring event.

4.10 Adopted Screening Criteria

Adopted screening criteria references national guidance in the form of the PFAS National Environmental Management Plan, Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance.

At the time of preparing this SAQP, a number of relevant guidance documents were in circulation in Australia including:

- PFAS National Environmental Management Plan (NEMP) Version 2.0, Heads of EPA (HEPA) Australia and New Zealand. January 2020 (HEPA, 2020)
- Department of Health (DoH), 2017. Health Based Guidance Values for PFAS for use in site investigations in Australia. April 2017 (FSANZ, 2017)
- National Health and Medical Research Council (NHMRC), 2019. Guidance on PFAS in Recreational Water. August 2019 (NHMRC, 2019)

D R A F T

- National Environment Protection (Assessment of Site Contamination) Measure 1999, Schedule B1, as amended in 2013 (ASC NEPM, 2013).

The screening criteria adopted to assess the data generated as part of this SAQP are presented in **Table 12** and **Table 13** below, for human and ecological receptors, respectively. Note that the HEPA NEMP 2.0 (2020) does not provide screening criteria for PFAS in sediments.

Table 12 PFAS Adopted Screening Criteria – Human Receptors

Media	Pathway	Compound	Criteria	Comment/Reference
Water – Groundwater	Drinking water	PFOS + PFHxS	0.07 µg/L	The values presented in the PFAS NEMP, 2020 are from DoH 2017, which published final health-based guidance values for PFAS for use in site investigations in Australia. DoH utilised the TDI for PFOS and PFOA from FSANZ, 2017 and the methodology described in Chapter 6.3.3 of the National Health and Medical Research Council's (NHMRC) Australian Drinking Water Guidelines (ADWG), 2022 to determine drinking water values. For PFHxS, DoH 2017 noted that '*FSANZ concluded that there was not enough toxicological and epidemiological information to justify establishing a tolerable daily intake. However, as a precaution, and for the purposes of site investigations, the PFOS tolerable daily intake should apply to PFHxS. In practice, this means that the level of PFHxS exposure should be added to the level of PFOS exposure; and this combined level be compared to the tolerable daily intake for PFOS*'. *All groundwater results will be compared to these criteria.*
		PFOA	0.56 µg/L	
Water – Surface Water and Groundwater	Recreational use	PFOS + PFHxS	2 µg/L	The previous values presented in the PFAS National Environmental Management Plan (NEMP), 2018 were from DoH 2017, which published final health-based guidance values for PFAS for use in site investigations in Australia. However, in 2019 the NHMRC's water quality advisory recommended an alternative methodology to calculate recreational guideline value. Instead of basing it on an ingestion rate of 0.2 L of water per day (as per the *Australian Drinking Water Guidelines* [ADWG] formula), NHMRC (2019) adjusted this rate with consideration of an event frequency (150 events / year) to calculate an annual ingestion rate of 30 L per year. These NHMRC (2019) values have since been adopted under Revision 2.0 of the PFAS NEMP (HEPA, 2020). Note: given that groundwater at the Base is extracted for irrigation purposes (post treatment), the recreational guidelines have been adopted to be protective of this water use activity.

D R A F T

Media	Pathway	Compound	Criteria	Comment/Reference
				All surface water and groundwater results will be compared to these criteria.

Table 13 PFAS Adopted Screening Criteria - Ecological Receptors

Media	Pathway	Compound	Criteria	Comment/Reference
Water – Groundwater and Surface Water	Freshwater	PFOS	0.00023 µg/L	The values are from the PFAS NEMP (HEPA, 2020) which endorsed the Australian and New Zealand Guidelines for Fresh and Marine Water Quality – draft default guideline values. AECOM understands that these guidelines are currently being reviewed and will consider the appropriateness of considering any future revision. The 99% species protection level has been applied for high value conservation systems. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife. It is proposed that the laboratory LOR is adopted for the purposes of preliminary screening of analytical water results, rather than sole use of the criteria value. *All surface water and groundwater results will be compared to these criteria.*
		PFOA	19 µg/L	

The adopted screening criteria for aquatic biota sampling are sourced from the Food Standards Australia New Zealand (FSANZ) *Perfluorinated chemicals in food* (FSANZ, 2017) and are summarised in **Table 14** below.

Table 14 PFAS Screening Criteria - Aquatic Biota

Compound	Criteria	Comment
FSANZ 2017 2-6 years Crustaceans (all species)		
PFOS	0.065 mg/kg	*All school prawn sample results will be compared against these criteria*
PFHxS	0.065 mg/kg	
PFOA	0.520 mg/kg	
FSANZ 2017 2-6 years Finfish (all species)		
PFOS	0.0052 mg/kg	*All luderick and dusky flathead sample results will be compared against these criteria*
PFHxS	0.0052 mg/kg	
PFOA	0.0410 mg/kg	

4.11 Waste Management

Due to the proposed “no purge” sampling methodology adopted for the majority of the groundwater monitoring locations and the grab samples from the designated surface water sampling locations, it is not anticipated that significant volumes of liquid waste would be generated that would require on-Site management and disposal.

All consumables (i.e. HydraSleeves™, general rubbish) will be bagged and placed in on-Site general waste bins for disposal.

D R A F T

4.12 Field Quality Assurance/Quality Control Sampling

4.12.1 Intra-laboratory and Inter-laboratory Duplicate Samples

Intra-laboratory (blind) duplicate samples and inter-laboratory (split) duplicate samples will be collected and analysed at a minimum frequency of 1 in 10 primary samples, in accordance with the QA/QC requirements outlined in HEPA (2020).

4.12.2 Rinsate Samples

Rinsate blank samples will be collected and analysed at a minimum frequency of 1 per day of fieldworks, in accordance with HEPA (2020).

Rinsate blanks will be collected by pouring laboratory supplied deionised water over decontaminated gauging and sampling equipment that will be re-used (e.g. interface probe, trowel).

4.13 Fieldwork Documentation

4.13.1 Field Notes

Field notes will be maintained to record all field sampling events and include observations made at each sample location. Field notes will include general site setting, location information, and information specific to the sample media, as follows:

- weather conditions, and visual or olfactory conditions at the location
- location coordinates and means of access, and any changes from previous access to a specific location
- groundwater samples – the observed characteristics of the sample (e.g. colour, turbidity, presence/absence and nature of odours, presence/absence of slicks or sheens) and measured field water quality parameters (pH, EC, DO, ORP, temperature) will be recorded. Condition of monitoring wells and gauging details will also be recorded
- surface water samples – the observed characteristics of the sample (e.g. colour, turbidity, presence/absence and nature of odours, presence/absence of slicks or sheens) and field water quality parameters (pH, EC, DO, ORP, temperature) will be recorded. Additionally, a description of each surface water sampling location will be recorded, such as indicating the waterbody type (lake, stream, etc.), presence/absence of water flow, and waterbody width
- sediment samples – the observed characteristics of the sample (e.g. colour, sediment type, moisture, presence/absence and odours) and the depth will be recorded
- the quality control (e.g. duplicate and inter-laboratory duplicate) sample details be recorded.

The ESdat Field Portal will be utilised by field staff to capture consistent field data based on project specific requirements, minimise potential data transcription errors and facilitate efficient data review.

4.13.2 Sample Labels

Sample containers will be labelled, as a minimum, with the following information:

- AECOM project number
- name of sampler
- sample ID
- date of sample collection.

An indelible felt pen will be used for labelling, to ensure that the lettering is not erased during transit to the laboratory. Sample containers that are sent to the primary laboratory, ALS, will also be scanned into the laboratory's custom-built mobile app (by scanning the barcode applied to each laboratory-supplied container) for streamlined labelling and Chain of Custody (CoC) creation and to ensure compliant sample IDs are used in the field.

D R A F T

4.13.3 Chain of Custody Forms

A CoC form will be completed, documenting the sample identification number and analytes. The CoC documents the chain of events from sample collection to delivery at the laboratory and provides a traceable account of sample handling. The CoC form will be signed by both the sample collector and the receiving laboratory.

The CoC form will include the following information:

- job number
- date and time of sample collection
- sample ID
- type of containers
- name of sampler
- laboratory to be used
- analyses required
- any comments
- signatures of the sampler and laboratory receiver.

In the event that additional samples are collected during the field investigations due to observations made by the Field Team, (i.e. samples not proposed in this SAQP), Defence will be provided the rationale for collection of those samples and proposed laboratory analyses. Defence approval will be sought to include these samples on the CoC and to dispatch these samples to the laboratory.

Upon receipt of the original documents accompanying the samples at the laboratory, the laboratory will provide a sample receipt document (noting the temperature of samples upon receipt, analyses required and any non-conformances) and return the signed CoC form and sample receipt notification (SRN) to confirm analyses to be performed and the due date for the analytical results.

4.14 Reporting

4.14.1 Sampling Event Factual Report

AECOM will prepare and submit a Sampling Event Factual Report to Defence following the completion of each sampling event. The Sampling Event Factual Report will include:

- details of the scope completed
- a description of the sampling methodologies used
- identification of any components of the scope that could not be completed
- a summary of field observations (e.g. any visual or olfactory observations that may indicate impacts to surface water or groundwater) and water quality parameter measurements
- evaluation of the applicability of adopted assessment levels
- a presentation of the analysis results in a table that includes comparisons with PFAS guidelines
- a presentation of groundwater levels for the event on a figure with inferred contours and inferred groundwater flow direction
- review of the suitability of the data for assessment purposes (QA/QC evaluation)
- inclusion of the following information as attachments:
    - field data including field water quality parameter and gauging measurements
    - chain of custody forms
    - laboratory analytical certificates

D R A F T

- equipment calibration certificates.

The Sampling Event Factual Report will be provided to Defence no later than four weeks after completion of the field component. AECOM will inform Defence in the case of delays in laboratory results.

4.14.2 Ongoing Monitoring Report

At the end of each 12-month monitoring period, AECOM will prepare and submit an Ongoing Monitoring Report (OMR) to Defence. The OMR will include:

- evidence of compliance with the requirements of the SAQP and meeting stated objectives of the OMP (Defence, 2023a)
- identification of any components of the scope that could not be completed
- a summary of any changes to the monitoring network condition that may affect data integrity, or require rectification works, and recommendations for repair, replacement or decommissioning of a location
- relevant figures depicting sampling locations and site-specific hydrogeological features
- laboratory results and analysis including comparison with relevant screening criteria
- assessment and commentary on appropriate QA/QC procedures
- data interpretation, including trends in groundwater concentration, gradient and flow directions
- assessment of statistically based trends (as described in Step 3 and 5 of the DQOs) that may inform decision making when it comes to the revision of the OMP (Defence, 2023a) including whether a review of the Conceptual Site Model is required or whether the risk profile has changed overall, or for any specific location at the base, and a recommendation as to whether this should trigger an OMP and/or PMAP review, or other action.
- inclusion of the following information as attachments:
  - field data including field water quality parameter and gauging measurements
  - CoC forms
  - laboratory analytical certificates
  - equipment calibration certificates.

D R A F T

5.0 Deviations from OMP

While the scope of works and methodology described in this SAQP are consistent with that presented in the OMP (AECOM, 2023a), a point of deviation is noted (refer to **Table 15** below).

Table 15 Deviations from OMP

No.	Description	Rationale
1	Addition of private property sampling locations MW139, POT046, POT085, POT107, POT144 and POT236	Following the removal of the sampling locations from the OMP (2019a), private property owners requested for the locations to continue to be sampled as part of the OMP (2023a).

SOP for Aquatic Biota Sampling

APPENDIX C:

Standard Operating Procedure for Aquatic Biota Sampling

1.0 Introduction

This procedure describes the methods for collecting representative aquatic biota samples from Fullerton Cove. If followed properly, use of this procedure will promote consistency in sampling collection and ensure regulatory compliance across Australia where best practice guidelines have been developed.

It is assumed that an appropriately experienced sub-contractor will be engaged to undertake the sampling. The subcontractor should hold the appropriate sampling permits and ethics approvals for the specific activity that is being undertaken. The sub-contractor engaged will supply all the necessary equipment to catch and store the samples on the vessel.

It is anticipated that an Environmental Scientist will be present at all times during the sampling stage of the works. However, in instances where this may not be possible due to the restrictions of the vessel, the sub-contractor will be fully briefed by the Environmental Consultant as to the procedure required.

2.0 Health and Safety

Health and Safety Plan (HASP) and task specific Safe Work Method Statements (SWMS) will be prepared prior to field works. The SWMS or Job Safety Analysis (JSA) will also be prepared by the sub-contractor for their specific tasks.

Prior to commencement of the works the project team will review the SWMS/JSA and discuss the potential hazards and mitigation measures.

Once the project team arrive at the sampling location, the hazards must be identified and adequate precautions must be taken to ensure the safety of the sampling team.

All sampling personnel must wear personal flotation devices (life vests). In addition it is assumed that the majority of the sampling will be from a boat, where appropriate protective measures must be identified and implemented in accordance with reviewed and approved HASP and SWMS/JSA. In addition, the use of electronic position indicating radio beacons (EPIRBs) will be considered.

3.0 Equipment

Equipment needed for collection of aquatic biota samples, may include:

- Stainless steel buckets.
- Two stainless steel identification board.
- Stainless steel ruler.
- Laboratory supplied polypropylene containers.
- GPS.
- Camera.
- Clipboard.
- Analytical-quality de-ionised water (15 L).
- Notebook / Felt-tipped markers / Waterproof labels.
- Digital scales.
- Cool box and ice.

- Figures of the sampling sites.
- Life vests.

4.0 Procedure

The following steps will be performed:

Monitoring

The following monitoring will be undertaken:

- Target sentinel species, namely School Prawn, Luderick and Dusky Flathead.
- Collection 4 composites of up to 10 individuals be prepared for each species.
- Monitor in Fullerton Cove.
- Monitor between December to March, every second year.

Planning, Mobilisation and Setup

- Prior to mobilisation, the sampling team will review the SAQP and this SOP to ensure they are familiar with the sampling plan, the sampling methods to be employed, and the types and amounts of equipment and supplies needed. This will be conducted by a project kick-off meeting.
- A kick-off meeting will also be conducted with the sub-contractor to ensure that the appropriate documentation in terms of permits are in place.
- The laboratory will be contacted at a minimum of one week prior to the intended sampling date to confirm the mass of tissue required and to ensure that the laboratory has the appropriate personnel available for preparation.
- Field staff will arrange field sampling equipment, as required.
- Weather forecast will be checked in the lead up to the sampling event. In the event that the forecast indicates stormy conditions, the sampling will be postponed until the weather clears.

On Arrival to Site/ Daily

- The conditions on arrival at site will be evaluated and discussed during the Toolbox talk. The sampling team will review the HASP and any modifications to the HASP and SWMS/JSA will be documented.
- Date, time of arrival on site, and site conditions (including weather) will be recorded.
- General locations for sampling will be marked or identified on a site map with a geo-reference to landmarks/topography. GPS coordinates will be recorded for each location. As required, the proposed locations may be adjusted based on site conditions and access.
- Photographs of the sampling locations and surrounding conditions will be taken.

Sampling

- Prior to sampling all dissection equipment will be decontaminated using laboratory supplied deionized water and three separate rinse stages. Sampling and monitoring equipment will also be decontaminated between sampling events at the same location, and following completion of the sampling event.
- Buckets will be prepared for sample holding and cleaning. One bucket (Bucket 1) will be filled with the local water and labelled and a second (Bucket 2) and third bucket (Bucket 3) with DI water. Scrubbing brushes will be used to clean the sample, where required. All scrubbing brushes will be kept in their appropriate buckets – labelling buckets and scrubbing brushes will ensure they are not mixed.
- Samples will be captured utilising the following process, similar to the previous methodologies used during the DSI, and undertaken in accordance with the appropriate permits and ethics approval:
    - Boats will be used to deploy mesh netting. Nets will be placed over night in the target locations and will be collected the following morning. Observations on the number of target species captured, bycatch and water quality will be recorded. Bycatch will be returned to the water, where possible.

- A prawn trawler will be used to trawl a net throughout the target area. At the end of each sampling run the net will be inspected. Observations on the number of target species captured, bycatch and water quality will be recorded. Bycatch will be returned to the water, where possible.
- All target specimens will be retrieved from the nets, euthanised, then prepared for processing to the laboratory. Target fish will be euthanized by blunt force trauma, followed by exsanguination. No compositing will be undertaken in the field.

- Whole samples will be placed on the first identification board, and assigned one of three groupings; Group PR, Group GX or Group GY by the environmental consultant. Groupings are presented in **Table 1**. The species will be logged and measured to confirm if the sample is the legal length, where applicable.
- Where sample does not meet the legal requirements, the sample details will still be recorded, but returned to the water.
- If sample meets the appropriate requirements, it will be placed in Bucket 1 and rinsed of foreign matter.
- The sample will be assigned a sample ID, as per the sample naming system presented in **Table 2** below. The sample will be moved from Bucket 1 and euthanized.
- The sample will be weighed and the weight recorded together with the biometric information as per **Table 3**. Where the specie is from one of the sample groups that are to be composited, sufficient species will be grouped together, with sufficient mass, to form the one sample (with one sample ID).
- After weighing, the sample will be placed in Bucket 2 (containing DI water), scrubbed with a brush and rinsed, the sample will then be rinsed in Bucket 3. The sample will be photographed after it is rinsed. Rinsate samples will be collected as documented in the OMP.
- The sample will be placed into the appropriate sample containers and labelled with the ID. In addition, the sample will also be labelled with the time the sample was bagged and weight of the sample. The sample will be photographed after it is bagged.
- Samples will be placed on ice, the chain of custody (CoC) documentation completed including the job number. Date and time of sample collection, sample ID, name of sampler, laboratory to be used, analyses required, any comments and signatures of the sampler and laboratory receiver.
- The samples will be transported to the laboratory as soon as practicable.
- Upon receipt of the original documents accompanying the samples at the laboratory, the laboratory will provide a sample receipt document (noting temperature of samples upon receipt, analyses required and any non-conformances) and return the signed CoC form to confirm analyses to be performed. Subject to laboratory processing times the samples will be processed and dissected on the day following capture (within the laboratory).

On Leaving Site

- Place all specimens in appropriate containers and chilled.
- Ensure all samples are appropriately labelled and kept out of sunlight once sampled.
- Call the laboratory and let them know that the samples are being delivered.
- Follow the communications plan detailed in the HASP on demobilisation from site.

5.0 Sample Preparation

As noted in **Section 4.0**, samples are caught whole, washed at the point of sampling and then transported to the laboratory.

The samples will be registered in line with the laboratory procedures (as noted in **Section 4.0**).

Two types of sample preparation will be required depending on the Biota Group:

- Group PR will be prepared as composite samples as detailed in **Section 5.1**; and
- Group X and Group Y will be prepared as whole samples.

5.1 Composite sampling (prawns)

This step relates to samples with an ID relating to Group PR.

The sample will be removed from its storage container and deshelled. The edible portion of the sample will removed from the remainder of the sample. The portion of the sample removed from the shell will be weighed and recorded.

The deshelled potion will be placed into an appropriate container.

All surfaces and equipment discarded or cleaned with scrubbing and clean water between each sample. Knife mill and homogeniser cleaned with PFAS-free detergent and clean water.

All samples to be held will be placed into appropriate storage containers and placed in freezers in the laboratory.

5.2 Whole samples (fillets)

This step relates to samples with an ID relating to Group GX and Group GY.

The sample will be descaled and gutted.

If the contents of the gut are identifiable, it will be recorded.

Where fish gonads (i.e. roe and milt) are present, they will be removed from the fish and recorded. The fish gonads will be placed in separate containers and assigned an ID of the parent fish, with a sub ID GONADS. The sample will be frozen and placed on hold and will be analysed, pending discussion with project team.

Once the sample is descaled and gutted, the sample will be filleted with the skin intact. The right side fillet will be used as the primary sample and the left side fillet will be placed on hold. Where a fish is earmarked for duplicate or triplicate analysis the left fillet of the primary will be used.

All surfaces and equipment discarded or cleaned with scrubbing and clean water between each sample. Knife mill and homogeniser cleaned with PFAS-free detergent and clean water.

5.3 Sample Details

The length for each species is provided in **Table 1**, below.

Table 1 Species List and Groupings

Species	Legal length* cm Saltwater
PR	
School Prawn (Metapenaeus macleayi)	-
Group GX	
Dusky Flathead (Platycephalus fuscus)	36
Group GY	
Luderick (Girella tricuspidata)	27

*Legal Length (should be confirmed with NSW DPI website at the time of sampling)

The sample nomenclature is presented in **Table 2**, the example shows that sampling occurs in Fullerton Cove (FC) with one dusky flathead, one luderick and one school prawn caught.

Table 2 Sampling Nomenclature

Site	Species Group	Sample number	Date	Sample ID	Comment
FC	PR	002	20180111	FC_PR_002_20180111	School Prawn
FC	GX	003	20180111	FC_GX_003_20180111	Dusky Flathead

PFAS INVESTIGATION AND MANAGEMENT

GUIDANCE DOCUMENT E
STANDARD PFAS ANALYTICAL SUITE

Document Version History

Document Reference	Revision	Date
AF29889468	1	10 July 2017
AF32594670	2	21 March 2018
AF32594670	3	6 April 2018
BS24034025	4	1 October 2021
BS24034025	5	29 June 2022

Analytical laboratories analyse a range of PFAS which includes a small subset of all possible PFAS. These analytical suites vary between laboratories and over time as new chemical standards become available. The minimum suite required for Defence PFAS investigations and management is listed in Table 1.

Table 1 Minimum PFAS analytical suite for Defence PFAS investigations and management

Group	Acronym	Chemical Compound	CAS No.
Perfluoroalkane Sulfonic Acids	PFBS	Perfluorobutane sulfonic acid	375-73-5
	PFPeS	Perfluoropentane sulfonic acid	2706-91-4
	PFHxS	Perfluorohexane sulfonic acid	355-46-4
	PFHpS	Perfluoroheptane sulfonic acid	375-92-8
	PFOS	Perfluorooctane sulfonic acid	1763-23-1
	PFDS	Perfluorodecane sulfonic acid	335-77-3
Perfluoroalkane Carboxylic Acids	PFBA	Perfluorobutanoic acid	375-22-4
	PFPeA	Perfluoropentanoic acid	2706-90-3
	PFHxA	Perfluorohexanoic acid	307-24-4
	PFHpA	Perfluoroheptanoic acid	375-85-9
	PFOA	Perfluorooctanoic acid	335-67-1
	PFNA	Perfluorononanoic acid	375-95-1
	PFDA	Perfluorodecanoic acid	335-76-2
	PFUnDA	Perfluoroundecanoic acid	2058-94-8
	PFDoDA	Perfluorododecanoic acid	307-55-1
	PFTrDA	Perfluorotridecanoic acid	72629-94-8
	PFTeDA	Perfluorotetradecanoic acid	376-06-7
Perfluoroalkyl Sulfonamides	FOSA	Perfluorooctane sulfonamide	754-91-6
	MeFOSA	N-Methyl perfluorooctane sulfonamide	31506-32-8
	EtFOSA	N-Ethyl perfluorooctane sulfonamide	4151-50-2
	MeFOSE	N-methyl perfluorooctane sulfonamidoethanol	24448-09-7
	EtFOSE	N-Ethyl perfluorooctane sulfonamidoethanol	1691-99-2
	MeFOSAA	N-methyl perfluorooctane sulfonamidoacetic acid	2355-31-9
	EtFOSAA	N-ethyl perfluorooctane sulfonamidoacetic acid	2991-50-6
(n:2) Fluorotelomer Sulfonic Acids	4:2 FTS	4:2 Fluorotelomer sulfonic acid	757124-72-4
	6:2 FTS	6:2 Fluorotelomer sulfonic acid	27619-97-2
	8:2 FTS	8:2 Fluorotelomer sulfonic acid	39108-34-4
	10:2 FTS	10:2 Fluorotelomer sulfonic acid	120226-60-0

The minimum PFAS analytical suite is based on consideration of analytical capability and the dominant PFAS that are likely to be present in environmental media due to legacy contamination from AFFF used by Defence. In specific instances, for example analysis of AFFF concentrates, it may be necessary to use other methods such as the TOP and/or TOF assays. In these cases, the analytical methods need to be established by data quality objectives (DQOs) for the project.

The laboratory is required to use NATA accredited methods for PFAS quantification based on guidance in the *PFAS National Environmental Management Plan* (NEMP, 2020).

1.0 Introduction

1.1 Preamble

AECOM Australia Pty Ltd (AECOM) has been engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) at the RAAF Base Williamtown ('the Base') and the Williamtown Management Area.

Between 24 January and 22 April 2024, AECOM undertook an aquatic biota sampling event at Fullerton Cove (refer to **Figure F1**, in **Appendix A**) located approximately 4 km southwest of the Base and included selected locations and specific species as outlined in the *Addendum Ongoing Monitoring Plan – Biota Sampling, RAAF Base Williamtown* dated May 2019 (AECOM, 2019).

The monitoring event was undertaken in accordance with the *Sampling and Analysis Quality Plan* (SAQP) Rev K (AECOM, 2023).

1.2 Objectives

The objective of the biota sampling event is to provide the NSW Government with monitoring data of temporal variations of PFAS concentrations in selected sentinel finfish and Crustacea appropriate to support and/or update ongoing advice relating to minimising PFAS exposure.

2.0 Scope of Work

The planned scope of work for the biota sampling event included:

- collection of aquatic biota specimens from Fullerton Cove between 24 January 2024 and 22 April 2024. The target biota species collected comprised dusky flathead (*P. fuscus*), luderick (*G. tricuspidata*) and the school prawn (*M. macleayi*)
- preparation of 12 composite samples (up to 10 individuals for dusky flathead and luderick, and up to 40 individuals for school prawn) by the National Measurement Institute (NMI) laboratory.
- retention of one frozen composite sample at NMI for potential future analysis
- collection of data relating to the type and quantity of any bycatch caught in the sampling equipment
- collection of water quality parameters (dissolved oxygen, electrical conductivity, pH, redox and temperature) during sampling
- photograph the aquatic biota specimens caught and the sampling locations and keep on record in project file
- analysis of the composite samples for the extended PFAS suite at the standard laboratory limit of reporting (LOR)
- preparation of this factual biota sampling event report.

Deviations from this scope are discussed in **Section 3.0**.

3.0 Deviations from the SAQP

The 2024 biota sampling event was completed in general accordance with the SAQP (AECOM, 2023), with the exception of the deviations outlined in **Table 1** below.

Table 1 Deviations from SAQP (AECOM, 2023)

SAQP	January to April 2024 Sampling Event
Annual biota sampling events are to be completed in February	Due to the reported scarcity of sentinel species in Fullerton Cove, NSW Department of Primary Industries (DPI), Port Stephens Fisheries Institute (Fisheries) recommended extending the duration of the annual biota sampling event from January 2024 until April 2024 in an effort to collect the target number of individual specimens.
Method of fish euthanasia	During the 2024 sampling event, fish were euthanised by ice and water, rather than the methodology specified in the SAQP (blunt force trauma followed by exsanguination). This alternative method was considered by DPI Fisheries to be suitable and within their permit. This change in methodology is unlikely to impact the reliability of the results.
Records of water quality parameters	During sample collection events on 19 February 2024, and 28 March 2024, DPI Fisheries did not record water quality parameters. While this is noted to be a deviation from the SAQP, it is not considered to impact the reliability of the analytical data collected.

4.0 Methodology

The biota sampling event was completed at Fullerton Cove between January to April 2024 in accordance with the OMP (AECOM, 2019) and the SAQP (AECOM, 2023).

4.1 Sampling Locations

The sampling was conducted on 24 January 2024, 19 February 2024, 28 March 2024 and 22 April 2024 in Fullerton Cove from two locations shown in **Table 2** below. Samples were collected by the DPI Fisheries.

Refer to **Figure F2** in **Appendix A** for specific biota sampling locations.

Table 2 Biota Sampling Locations

Sample Location ID	Sampling Date	Latitude	Longitude
1	24/01/2024	-32.832225	151.799092
2	19/02/2024 28/03/2024 22/04/2024	-32.850325	151.802096

4.2 Sample Type

The following sentinel species as outlined in the OMP (AECOM, 2019) were sampled:

- Dusky flathead (*P. fuscus*)
- Luderick (*G. tricuspidata)*
- School prawn (*M. macleayi*).

4.3 Sampling Methodology

DPI Fisheries were responsible for obtaining the required sampling permits, and sample collection was conducted under a Section 37 Scientific Collection Permit (Permit FP23-55), and an Animal Research Authority issued by NSW Department of Primary Industries (Permit 22-502).

4.3.1 Sample Collection

Aquatic biota samples were captured utilising the following process:

- boats were used to deploy mesh netting. Nets were placed in the target locations and were collected within 3 hours for luderick and dusky flathead. School prawns were captured using an otter trawl net
- observations on the number of target species and bycatch captured were recorded. Live bycatch was returned to the water, and dead bycatch was retained and disposed
- target specimens were retrieved from the nets and euthanised by ice and water
- target specimens were placed in labelled plastic bags and transported to the Port Stephens Fisheries Institute on ice in a portable cooler.
- target specimen metrics (length, weight, bag number) were recorded at the Fisheries Institute by DPI Fisheries with the exception of eastern school prawns, which were not measured (length).
- water quality parameters including (dissolved oxygen, electrical conductivity, pH, redox and temperature) were recorded by DPI Fisheries.

4.3.2 Sample Preparation

Aquatic biota sample preparation (for analysis) was undertaken utilising the following process:

- Biota sample preparation occurred at the Fisheries Institute which involved descaling the fish, removing the left fillet (with skin remaining on the fillet), and placing it into a clean plastic bag corresponding to that particular composite sample. Prawns were peeled and muscle meat (including vein) placed into the bag.
- DPI Fisheries prepared 12 composite samples of up to 10 individuals for finfish and 87 individuals for school prawn. The bags containing the composites were frozen in readiness for shipment to the laboratory. The composite sample information is presented in **Table 3**.

The biota samples were transported directly from the Fisheries Institute to NMI laboratory, located in North Ryde NSW on ice and under chain-of-custody (CoC). Each composite sample was homogenised at the laboratory in readiness for PFAS analysis.

Table 3 Composite Sample Information

4.4 Laboratory Analysis

The composite biota tissue samples were analysed for the extended PFAS suite.

Laboratory reports and CoC documentation are presented in **Appendix C**.

4.5 Adopted Screening Criteria

The adopted screening criteria for this aquatic biota sampling event are sourced from the Food Standards Australia New Zealand (FSANZ) *Perfluorinated chemicals in food* (FSANZ, 2017) and are summarised in **Table 4** below.

Table 4 PFAS Screening Criteria - Aquatic Biota

Compound	Criteria	Comment
FSANZ 2017 2-6 years Crustaceans (all species)		
PFOS	0.065 mg/kg	*All school prawn sample results will be compared against these criteria*
PFHxS	0.065 mg/kg	
PFOA	0.52 mg/kg	
FSANZ 2017 2-6 years Finfish (all species)		
PFOS	0.0052 mg/kg	*All luderick and dusky flathead sample results will be compared against these criteria*
PFHxS	0.0052 mg/kg	
PFOA	0.041 mg/kg	

4.6 Data Quality Objectives and Data Validation

The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2023).

Data validation assessment is provided in **Appendix D**.

Data validation procedure employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report.

All data collected during this event has been reviewed and uploaded to the Defence ESdat database in accordance with DCMM requirements

5.0 Results

5.1 Conditions During Sampling

Sampling was conducted on 24 January 2024, 19 February 2024, 28 March 2024 and 22 April 2024. Weather conditions recorded by the Bureau of Meteorology (BoM) (Station 061078) on these dates are summarised in **Table 5** below:

Table 5 Weather Observations

Date	Temperature(˚C)	Rainfall (mm)	Max Wind (km/h)
24 January 2024	17.2 – 33.3	0	31
19 February 2024	20.9 – 23.6	0.2	37
28 March 2024	16.5 – 25.2	0.2	37
22 April 2024	13.5 – 23.6	0	30

The water quality parameters collected on 24 January 2024 and 22 April 2024 are summarised in **Table 6**.

Table 6 Water Quality Parameters

Date	Dissolved Oxygen (mg/L)	Electrical Conductivity (mS/cm)	pH	Turbidity (NTU)	Temperature (°C)
24 January 2024	6.04	45.5	7.89	24.5	23.97
22 April 2024	6.93	27.5	7.95	52	18.14

5.2 Number of Sampled Biota and Characteristics

A summary of the bycatch reported by DPI Fisheries during the 2024 biota sampling event is provided below:

- 15 Tailor, two (2) Mulloway, five (5) Mullet and three (3) Blue Swimmer Crabs on 24 January 2024
- Nine (9) Blue Swimmer Crabs, three (3) Mud Crabs and one (1) Yellowfin Bream on 19 February 2024
- Five (5) Blue Swimmer Crabs and three (3) Mulloway on 28 March 2024, and
- No bycatch recorded on 22 April 2024.

The number of luderick (*G. tricuspidata)*, dusky flathead (*P. fuscus*) and school prawn (*M. macleayi*) collected during the 2024 biota sampling event are presented in **Table 7**.

The average length and weight recorded for each species was as follows:

- 2.65 grams (g) for school prawns. Note that the average length of school prawns was not recorded.
- 37 cm and 868 g for luderick.
- 46 cm and 632 g for dusky flathead.

Table 7 Aquatic Biota Sampled

Location ID	No. of School Prawn Samples	No. of Luderick Individuals	No. of Dusky Flathead Individuals
1	339	0	0
2	0	40	38

5.3 Analytical Results

The samples were analysed for the PFAS suite and are provided in **Table T1** in **Appendix B**.

A summary of the reported concentrations of PFOS, PFHxS and PFOA in biota tissues are presented in **Table 8**.

Table 8 Summary of Aquatic Biota PFAS Analytical Concentrations

Analyte	Number of samples analysed	Number of detections	Minimum concentration (mg/kg)	Maximum concentration (mg/kg)
Dusky Flathead (*Platycephalus fuscus*)				
PFOS	4	4	0.0054	0.01
PFHxS	4	1	<0.0001	0.00017
PFOA	4	0	<0.0001	<0.0001
Luderick (*Girella tricuspidata*)				
PFOS	4	4	0.0036	0.0042
PFHxS	4	0	<0.0001	<0.0001
PFOA	4	0	<0.0001	<0.0001
School Prawn (*Metapenaeus macleayi*)				
PFOS	4	4	0.0048	0.012
PFHxS	4	4	0.0015	0.0017
PFOA	4	4	0.00031	0.00037

A summary of the PFAS concentrations detected in the tissue samples is as follows:

- PFOS was detected in all biota composite samples with concentrations ranging between 0.0036 mg/kg and 0.012 mg/kg
- the PFOS concentrations in the four dusky flathead composite samples analysed were above the FSANZ (2017) finfish trigger value of 0.0052 mg/kg (for children aged between two and six years). PFHxS was reported in one dusky flathead composite sample (0.00017 mg/kg), however the concentration was an order of magnitude below the FSANZ (2017) finfish trigger value of 0.0052 mg/kg (for children aged between two and six years)
- the PFOS concentrations in the four luderick composite samples analysed were below the FSANZ (2017) finfish trigger value of 0.0052 mg/kg (for children aged between two and six years)
- the PFOS concentrations in the four school prawn composite samples analysed were below the FSANZ (2017) crustacean trigger value of 0.065 mg/kg (for children aged between two and six years)
- PFHxS was detected for the first time at a concentration above the laboratory limit of reporting (LOR) in dusky flathead. The reported concentration of PFHxS (0.0002 mg/kg) was below the FSANZ (2017) finfish trigger of 0.0052 mg/kg
- in addition to PFOS, PFHxS and PFOA were reported in the composite samples collected from the school prawn with concentrations ranging between 0.0015 and 0.0017 mg/kg for PFHxS and between 0.00031 to 0.00037 mg/kg for PFOA, which were all below the adopted FSANZ (2017) crustacean trigger value

The concentrations of PFAS were reported within the historical range (for samples collected between 2016 and 2022) for the respective sentinel species analysed with the exception of the first-time detection of PFHxS in dusky flathead. It is noted that the concentration reported during the current sampling event (0.0002 mg/kg) is below the historical laboratory LOR (0.0005 mg/kg), which suggests

that this compound was likely present at trace concentrations during historical sampling events, however they were below the laboratories limit of reporting at the time.

No other PFAS were detected at concentrations above the laboratory LORs in the luderick and dusky flathead composite samples analysed. Trace concentrations of PFNA, PFDA, PFPeS, PFHpS and N-MeFOSAA were reported in the school prawns composite samples above the laboratory LOR, however there are currently no screening criteria for these compounds.

6.0 Discussion

AECOM completed the biota sampling event in Fullerton Cove between 24 January 2024 and 22 April 2024 to meet the requirements of the OMP (AECOM, 2019). The target species collected were the school prawn *(M. macleaya)*; luderick (*G. tricuspidata)* and dusky flathead (*P. fuscus*).

A summary of the PFAS concentrations detected in the tissue samples was as follows:

- PFOS was detected in all biota composite samples with concentrations ranging between 0.0036 mg/kg and 0.012 mg/kg
- concentrations of PFOS in the dusky flathead composite samples analysed were above the FSANZ (2017) finfish trigger value of 0.0052 mg/kg (for children aged between two and six years). Concentrations of PFOS in remaining composite samples were below the FSANZ (2017) trigger values
- in addition to PFOS, PFHxS and PFOA were reported in the composite samples collected from the school prawn with concentrations ranging between 0.0015 and 0.0017 mg/kg for PFHxS and between 0.00031 to 0.00037 mg/kg for PFOA, which were all below the adopted FSANZ (2017) crustacean trigger value
- no other PFAS compounds were detected at concentrations above the laboratory LORs in the luderick and dusky flathead composite samples analysed. Trace concentrations of PFNA, PFDA, PFPeS, PFHpS and N-MeFOSAA were reported in the school prawns composite samples above the laboratory LOR, however there are currently no screening criteria for these compounds.

The concentrations of PFAS were reported within the historical range (for samples collected between 2016 and 2022) for the respective sentinel species analysed with the exception of the first time detection of PFHxS in dusky flathead. It is noted that the concentration reported during the current sampling event is below the historical laboratory limit of reporting, which suggests that this compound was likely present at trace concentrations during historical sampling events, however they were below the laboratories limit of reporting at the time.

The historical biota results collected under the OMP (between 2020 and 2024) are presented in **Table T2 (Appendix B)**. AECOM notes that no biota sampling events were undertaken in 2023 given that, at the time, the OMP (including the frequency of biota sampling events) was under review.

26-JUN-2024

REPORT OF ANALYSIS

All results are reported on a wet weight basis as received, and are corrected for labelled internal standard recoveries.

PFHxS and PFOS were quantified using combined branched and linear standards, for all PFAS linear and branched isomers in samples are totalled for reporting.

Results relate only to the sample(s) as received and tested.

* Denotes the analyte or test method is not within our ISO/IEC 17025 scope of accreditation.

Measurement Uncertainty is available upon request.
This Report shall not be reproduced except in full.

Data Validation

DATA VALIDATION APPENDIX D REPORT

Project number:	60612562	**Validation by:**	[redacted]	**Date:**	27/06/2024
Client:	Defence	**Data verified by:**		**Date:**	3/07/2024
Site:	Fullerton Cove	**Project Manager:**			
Matrix type:	Biota				
Primary Samples:	12 Composite Biota Samples				
Laboratory:	National Measurement Institute (NMI)				
Lab reference:	AECO03-240515 / RN1432806				

Key Issues:	No issues were identified that have the potential to impact upon the reliability of the Data. AECOM considers that the field procedures and laboratory QA/QC processes employed were appropriate for the purposes of the investigation.
Field Quality Assurance and Quality Controls	
Sample Collection	Samples were collected by an AECOM subcontractor (NSW Department of Primary Industries (DPI), Port Stephens Fisheries Institute (Fisheries).
Sampling Methodology	Aquatic biota samples were captured utilising the following process: • Boats were used to deploy mesh netting. Nets were placed in the target locations and collected within 3 hours for Luderick and Ducky Flathead. School prawns were captured using an otter trawl net. • Target specimens were retrieved from the nets and euthanised by ice and water. • Target specimens were placed in labelled plastic bags and transported to the Port Stephens Fisheries Institute on ice in an esky. • Target specimen metrics (length, weight, bag number) were recorded at the Fisheries Institute by DPI.
Chain of Custody	All samples taken were reported on the Chain of Custody documents (COC) and analysed for requested analytes.
Field QC Samples	As per the SAQP, no duplicate samples were collected as the samples were being composited. Individual specimens of the composite samples were retained to validate composite results as required. No Rinsate Blanks were included with this batch given nets were used to catch samples.
Handling and preservation	All biota samples were stored frozen before being submitted and shipped to the laboratory frozen, and in suitable conditions. All biota samples were received by NMI laboratories in appropriate containers. Sample homogenisation and preparation for analysis were undertaken in the laboratory.
Calibration of equipment	Measurement of surface water geochemical parameters was undertaken by NSW DPI. Calibration details have not been provided by NSW DPI.
Laboratory Quality Assurance and Quality Controls	
Tests requested/reported	All biota samples were analysed for PFAS (extended suite).

Holding time compliance	Samples were extracted and analysed within recommended holding times.
Laboratory	Aquatic Biota samples were analysed at the National Measurement Institute (NMI, Sydney), a NATA accredited laboratory (accreditation number 198).
Frequency of laboratory QC	The laboratory reported a sufficient frequency of quality control samples to assess whether the results have been reported to an acceptable accuracy and precision.
Method Blank (MB)	Method Blank concentrations were reported <LOR for all analytes tested. MB concentrations are presented in the laboratory Quality Assurance Report.
Laboratory Duplicate (LD) Relative Percent Difference (RPD)	Laboratory Duplicate Relative Percentage Differences were within the laboratory control limits. The LD RPDs are presented in the laboratory Quality Assurance Report.
Laboratory Control Spike (LCS) recovery	Laboratory Control Spikes recoveries were within the laboratory control limits. LCS recoveries are presented in the laboratory Quality Assurance Report.
Matrix Spike (MS) recovery	Matrix Spikes recoveries were within the laboratory control limits. MS recoveries are presented in the laboratory Quality Assurance Report.
Surrogate spike (SS) recovery	Surrogate Spike recoveries were within the laboratory control limits (50-150%) for regulated PFAS. Numerous samples reported recoveries outside the laboratory control limits for unregulated PFAS including PFTeDA, MeFOSE, EtFOSE and 4:2 FTS which was attributed to laboratory interference. It is noted that these SS recoveries are only marginally outside of control limits and, furthermore, the SS recoveries for PFOS and PFHxS were within the acceptable range for the analysed samples, and as such the minor non-compliance is not considered to affect the interpretation of results.
Quality Assurance and Quality Controls Data Evaluation	
Comparison of Esdat data and Laboratory Results	No anomalous results between Esdat output data and laboratory analysis results were noted.
Data transcription	A check of the laboratory results identified no anomalies within the electronic data, the laboratory reports, and tables generated by AECOM.
Limits of reporting	Limits of Reporting (LOR) were sufficiently low to enable assessment against adopted human health screening levels and were consistent with Defence (2022) *Guidance Document E Standard PFAS Analytical Suite* requirements.
Comments	
The data validation procedure employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report.

1.0 Introduction

1.1 General

AECOM Australia Pty Ltd (AECOM) has been engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) at the RAAF Base Williamtown (the 'base', Site ID 0908) and the Williamtown Management Area in New South Wales (NSW). The location of the base and Management Area is shown in **Figure F1** in **Appendix A**.

The OMP (Defence, 2023b) outlines the sampling requirements for the base and off-base areas within the Management Area.

Following each sampling event, factual sampling event reports will be prepared. Ongoing Monitoring Reports will be prepared following the completion of each 12-month sampling period.

This Sampling Event Factual Report has been prepared to report the results of the April 2024 annual sampling event and subsequent sampling undertaken in May 2024, July 2024 and August 2024 (herein referred to as April 2024 sampling event), specifically highlighting first-time detections and/ornew exceedances of human health or ecological screening criteria for the sum of perfluorooctanesulfonic acid (PFOS) and perfluorohexane sulfonic acid (PFHxS) (herein referred to as PFOS+PFHxS),PFOS and/or perfluorooctanoic acid (PFOA).

This report has been prepared in accordance with the Defence *PFAS OMP Factual Report Guidance (Version 0.2)* issued in May 2021 (Defence, 2021).

1.2 Objectives

The objectives were to:

- implement the OMP (Defence, 2023b); and
- collect data that will enable Defence to maintain an up to date understanding of the distribution, concentration, transport, and transformation of PFAS.

The data collected may be used to inform where new risk management actions may be required, or to support a determination that remediation has been completed so far as reasonably practicable, including updates and revisions to the PFAS Management Area Plan (PMAP) (Defence, 2023a).

The objective of this phase of works was to implement the scope of works for the April 2024 annual sampling event in accordance with the Sampling and Analysis Quality Plan (SAQP) (AECOM, 2024).

2.0 Scope of Work

The scope of work was completed in general accordance with the SAQP (AECOM, 2024), as follows:

- obtain permission (where required) to conduct works at the base, off-base publicly accessible areas and at private properties
- gauging of groundwater level in monitoring wells prior to collection of samples
- groundwater sampling and collection of water quality parameters at 133 of 136 scheduled monitoring wells and bores (refer to **Table 1** below and **Figure F2** in **Appendix A** for specific locations)
- surface water sampling and collection of water quality parameters at 24 of 25 scheduled surface water locations (refer to **Table 2** below and **Figure F3** in **Appendix A** for specific locations)
- sediment sampling at all 26 scheduled sediment locations (refer to **Table 3** below and **Figure F4** in **Appendix A** for specific locations)
- collection of field duplicate samples at a rate of 1 in 10 primary samples
- analysis of samples for PFAS suite at the standard limit of reporting (LOR)
- data management of the OMP field and laboratory data in Defence ESdat database
- preparation of this Sampling Event Factual Report.

The deviations from the scheduled scope of works are discussed in detail in **Section 3.0**.

Note: due to privacy considerations, selected monitoring locations are unable to be shown on the figures in **Appendix A**.

Table 1 Groundwater Sampling Locations

On/Off-base	Area	Sampling Location	Total
On-base	Former & Current Fire Station (Facility 165)	MW196, MW198, MW200, MW201D, MW201S, MW202D, MW202S	7
	Former DEMS Landfill (Facility 394)	MW171D, MW171S, M172, MW240D, MW281S, MW282S, MW329, MW340D, MW340S, MW342D, MW344D, MW344S, MW354	13
	Former Fire Training Area (Facility 479)	MW166, MW167, MW168, MW169D, MW169S	5
	HWC Pump Station 7 (PS7)	MW134D, MW134I, MW245D, MW245S, MW317D, MW317S	6
	Lake Cochran	MW108D, MW108S, MW109D, MW175D, MW179D, MW179S, MW466, MW468	8
	North-East Landfill	MW406	1
	Northern Boundary	MW155	1
	Trade Waste Treatment (Facility 480)	MW106D, MW106S, MW208, MW210D, MW210S, MW304, MW441, MW886	8

On/Off-base	Area	Sampling Location	Total
Off-base	Cabbage Tree Road	MW125D, MW125S, MW126D, MW126S, **MW139**, MW178, **MW230S**, **MW238D**, **MW238S**, **POT085***, **POT107**	11

3.0 Deviations from the SAQP

The April 2024 annual sampling event was completed in general accordance with the SAQP (AECOM, 2024) with the exception of the deviations outlined in **Table 4** below.

Table 4 Deviations from SAQP

SAQP Deviation	Comment / Justification	Impact on Dataset
Samples, and associated field parameters, were not collected from three of the 136 scheduled groundwater sampling locations.	Note that a total of five residential groundwater bore locations (POT046, POT085, POT107, POT144 and POT236) and one residential groundwater monitoring well location (MW139), were included following the publication of the updated OMP (Defence, 2023b) following discussions with private property owners. Therefore, these locations have been noted as deviations from the OMP. Of the five locations, three residential groundwater bore locations (POT046, POT085 and POT236) were not sampled as accesses approval from property owners were not received within the sampling period.	The lack of sampling data at the three residential bore locations is not considered to have a significant impact on the existing data or present a significant data gap given that the data collected since 2016 at these locations show that the PFAS concentrations have remained stable.
Samples, and associated field parameters, were not collected from one of the 25 scheduled surface water sampling locations.	Surface water location SW588 was dry and therefore could not be sampled during this event.	The lack of sampling data at this location (drain at the base boundary) is not considered to have a significant impact on the existing data or present a significant data gap given that the nearby downstream location (SW001) was able to be sampled, and that the Eastern Region stormwater drainage system will be sampled under a separate program of works in September 2024.
Surface water sample at one of the 25 scheduled surface water sampling locations was collected with a high-density polyethylene (HDPE) bailer.	Due to safety and access considerations, the surface water sample at locations SW582 (a stormwater drain on base) was collected using a dedicated disposable HDPE bailer, before being decanted into laboratory supplied bottles.	Given that sampling results for SW582 were within the historical range reported at this location, the change in sampling methodology is not considered to have impacted upon the reliability of the data for the purposes of the OMP.

4.0 Methodology

4.1 Sampling Methodology

The methodology used for the April 2024 annual sampling event was in general accordance with the SAQP (AECOM, 2024) and is summarised in **Table 5** below.

Table 5 Sampling Methodology

Item	Details
Groundwater gauging	The depth to groundwater was measured in each monitoring well immediately prior to collection of groundwater samples (where sampling was required) using an interface probe. In addition, a targeted gauging round including 29 selected monitoring wells was completed to generate data for the groundwater elevation contours and assess groundwater flow direction. The targeted gauging round was completed on 19 April 2024. Measurements of depth to groundwater were undertaken using a decontaminated interface probe, which was serviced by the supplier prior to use. The equipment supplier records are provided in **Appendix C**.
Field parameters	Temperature, electrical conductivity, dissolved oxygen, oxidation-reduction potential (ORP), pH and observations of water quality were recorded for groundwater and surface water samples. Water quality parameters were collected using a calibrated water quality meter. The equipment supplier service and calibration records, and field calibration records are provided in **Appendix C**.
Sampling methodology	**Groundwater Monitoring Wells** Groundwater samples were collected from monitoring wells using a no-purge methodology with HydraSleeves™ which were installed within the screened interval of the wells and avoiding placing the base of the HydraSleeves™ at the base of the monitoring well, where a build-up of sediment may be present. The installation depth of the HydraSleeves™ was recorded (as HydraSleeve™ collar depth in metres below top of casing (mbTOC)). HydraSleeves™, with bottom weights only, were installed / deployed in monitoring wells for a minimum of 4 hours prior to sampling, to allow re-stabilisation of the well following disturbance. For this event, majority of the HydraSleeves™ were installed during the previous sampling event in November 2023, with the exception of 13 which were installed during this sampling event. HydraSleeves™ were installed at the following: • MW304, MW329, MW340D, MW340S, MW342D, MW344D, MW344S, MW354S, MW441, MW731D, MW731S and MW886. These locations were new to OMP, therefore no HydraSleeves™ were present. • MW188D. No HydraSleeve™ was found at this location, which was noted to be damaged by road works during the previous annual sampling event in May 2023. At these 13 locations, AECOM installed HydraSleeves™ and returned after a minimum of 4 hours to collect the groundwater samples. In the event that a HydraSleeve™ fails to deploy or has been removed inadvertently (i.e. by a non-OMP project), the sample can be collected using a dedicated disposable HDPE bailer, if time or access constraints do not permit re-deployment of the HydraSleeve™ and subsequent sampling in the same

Item	Details
	sampling event. When sampling with a bailer, a minimum of three well volumes should be purged and purging should be continued until stabilisation of water quality parameters (to be collected continuously ex-situ) is achieved. If recharge is insufficient during purging, care should be taken to avoid purging the well dry and collecting the sample when reasonable to do so. The HydraSleeve™ in monitoring well MW245S failed to deploy as the water column had insufficient volume. Therefore, the well was sampled with a dedicated disposable HDPE bailer. The well's recharge was insufficient for purging. Following sampling, water quality parameters were recorded ex-situ, from any excess water available in the HydraSleeve™, and a new HydraSleeve™ was deployed at the screened interval depth at each location in preparation for the next scheduled sampling round, where practicable. As per the SAQP (AECOM, 2024), the groundwater samples from MW842 and MW844 were collected using a peristaltic pump, due to narrow PVC of these monitoring wells, while the groundwater sample from MW829 was collected using a dedicated disposable HDPE bailer, as this pump station bore/sampling point is a non-traditional well with no well cap or gatic. **Residential Bores** Bore water samples were collected by placing the laboratory provided sample bottle beneath the tap outlet and the tap slowly opened to collect the "first flush" of water. At each location, new laboratory supplied container were used with the caps immediately applied once the containers were full. Following sampling, water quality parameters were recorded ex-situ, by placing the water quality meter probe in a cup filled with bore water from the tap outlet. **Surface Water** Surface water samples were collected from either mid-way through the water column or approximately 0.5 m below the surface (if possible) using a 'grab' sample method, without disturbing the bottom of the surface water body and without capturing any surface film, to minimise collection of sediment, or floating materials in the samples. At each location, new laboratory supplied containers were lowered into the water with the caps immediately applied once the containers were full. Where sampling points were not able to be accessed safely, surface water samples were collected with use of a sampling pole. Description of each sampling location were recorded (including physical setting, flow observations, presence of sheen or foam etc). **Sediment** Sediment samples were collected from a depth representative of potentially deposited sediments and collected from within the water body, using a hand trowel to a maximum depth of 0.3 m below the sediment surface. A new laboratory supplied container was used at each location for collection of samples, and any reusable sampling equipment utilised was de-contaminated between locations. Description of each sampling location and the sample material was recorded.

Item	Details
QA/QC Samples	A QA/QC program was implemented for the sampling and analysis program in order to obtain representative data and assess the reliability of the data obtained. To facilitate the QA/QC program the following sample types were obtained during the sampling program: • *Intra-laboratory duplicates* collected at a rate of 1 in 10 primary samples. The relative percentage difference (RPD) should be less than 30%, or less than 50% if results are less than 20 times the LOR. Higher RPDs may also be acceptable if results are less than 10 times the LOR. • *Inter-laboratory duplicates* collected at a rate of 1 in 10 primary samples. The RPD should be less than 30%, or less than 50% if results are less than 20 times the LOR. Higher RPDs may also be acceptable if results are less than 10 times the LOR. • *Rinsate blanks* collected at a frequency of one per set of sampling equipment per day where equipment was reused between locations. Analytical results should be below the laboratory LOR. For this April 2024 annual sampling event, the QA/QC samples included: • 19x intra-laboratory duplicates (15 groundwater, 2 surface water and 2 sediment) which met the total target frequency • 18x inter-laboratory duplicates (14 groundwater, 2 surface water and 2 sediment) which was marginally below the total target frequency • 9 x rinsate blanks, which met the total target frequency. The total number of primary samples collected amounts to 163 samples for water (including the 6 anomalous samples) and 26 samples for sediment. The detailed data validation assessment is presented in **Appendix D**.
Sample analysis	Samples were submitted to the primary and secondary laboratories for PFAS suite at the standard LOR. ALS Environmental (ALS) Sydney, NSW was used as the primary laboratory. Envirolab Services (Envirolab) Sydney, NSW was used as the secondary laboratory. ALS and Envirolab methods for analyses were certified by the National Association of Testing Authorities (NATA). A summary of the laboratory results is presented in **Section 5.3** and the laboratory certificates are presented in **Appendix E**.

4.2 Adopted Screening Criteria

Guidance documents used to assess the dataset include the following:

- Heads of EPAs Australia and New Zealand (HEPA) 2020. *PFAS National Environmental Management Plan 2.0*. January 2020.
- Department of Health (DoH), 2017. *Health Based Guidance Values for PFAS for use in site investigations in Australia*. April 2017.
- Food Standards Australia New Zealand (FSANZ), 2017. *Supporting Document 1: Hazard assessment report – Perfluorooctane Sulfonate (PFOS), Perfluorooctanoic Acid (PFOA), Perfluorohexane Sulfonate (PFHxS).*
- National Health and Medical Research Council (NHMRC), 2019. *Guidance on PFAS in Recreational Water.* August 2019.

- National Environment Protection Council (NEPC), 2013. *Schedule B1. National Environment Protection (Assessment of Site Contamination) Measure 1999 (as amended 2013) Schedule B1 Guideline on Investigation Levels for Soil and Groundwater.*

The adopted PFAS screening criteria to assess the data generated as part of the OMP are presented in **Table 6** below. It is noted that, at the time of preparing this report, the PFAS NEMP (HEPA, 2020) did not provide any screening criteria for PFAS in sediments.

Table 6 Summary of Adopted Screening Criteria: Water

Media	Pathway	Compound	Criteria	Comment/Reference
Human Health Receptors				
Water – Groundwater	Drinking water	PFOS + PFHxS	0.07 µg/L	The values presented in the PFAS NEMP (HEPA, 2020) are from DoH (2017), which published final health-based guidance values for PFAS for use in site investigations in Australia. DoH utilised the Tolerable Daily Intake for PFOS and PFOA from FSANZ (2017) and the methodology described in Chapter 6.3.3 of the NHMRC's Australian Drinking Water Guidelines (ADWG) (2022) to determine drinking water values. For PFHxS, DoH (2017) noted that '*FSANZ concluded that there was not enough toxicological and epidemiological information to justify establishing a tolerable daily intake. However, as a precaution, and for the purposes of site investigations, the PFOS tolerable daily intake should apply to PFHxS. In practice, this means that the level of PFHxS exposure should be added to the level of PFOS exposure; and this combined level be compared to the tolerable daily intake for PFOS*'. *All groundwater results were compared to these criteria.*
		PFOA	0.56 µg/L	
Water – Surface Water and Groundwater	Recreational use	PFOS + PFHxS	2 µg/L	In August 2019, NHMRC's water quality advisory recommended an alternative methodology to calculate recreational guideline values. Instead of basing it on an ingestion rate of 0.2 L of water per day (as per the ADWG formula), NHMRC adjusted this rate with consideration of an event frequency (150 events/year) to calculate an annual ingestion rate of 30 L per year. These values were adopted in the PFAS NEMP (HEPA, 2020). Note: given that groundwater at the base is extracted for irrigation purposes (post treatment), the recreational guidelines have been adopted to be protective of this water use activity. *All surface water and groundwater results were compared to these criteria.*
		PFOA	10 µg/L	

Media	Pathway	Compound	Criteria	Comment/Reference
Ecological Receptors				
Water – Groundwater and Surface Water	Freshwater	PFOS	0.00023 µg/L	The values are from the PFAS NEMP (HEPA, 2020) which endorsed the Australian and New Zealand Guidelines for Fresh and Marine Water Quality. The 99% species protection level (for freshwater and interim marine) has been applied for high value conservation systems. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife. It is proposed that the laboratory LOR is adopted for the purposes of preliminary screening of analytical water results, rather than sole use of the criteria value. *All groundwater and surface water results were compared to these criteria.*
		PFOA	19 µg/L	

4.3 Data Quality Objectives and Data Validation

The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2024). Data validation assessment is provided in **Appendix D**.

Data validation procedures employed in the assessment of the field and laboratory's Quality Assurance and Quality Control data, completed as per Section 3.2 of the SAQP, indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable (i.e. >95% of the data was suitable for use and DQIs passed acceptance criteria) for the purpose of this factual report.

It is noted that potentially anomalous results were reported in MW155, MW159D, MW159S, MW241D, MW241S and MW844 following the sampling completed in April 2024. Given that the results were significantly different to historical data these monitoring wells were resampled in July 2024.

The results of the resampling confirmed that the April 2024 results for these locations were anomalous and therefore were omitted from use in this report.

Further details of the resampling and comparison of results are presented in **Appendix D**.

All data collected during this event have been reviewed and uploaded to the Defence ESdat database in accordance with Defence Contamination Management Manual requirements.

5.0 Field Observations and Results

5.1 General Observations

The weather conditions and general observations (including activities that may impact the monitoring program) recorded during the April 2024 annual sampling event are summarised below in **Table 7**. The sampling event was completed between 15 and 24 April 2024, with subsequent sampling visits on 9 May 2024 and 2 August 2024, and resampling on 31 July 2024.

Table 7 General Observations

Items	Observations
Weather Conditions	During the sampling event, the weather was observed to be variable, with the following observations made at Williamtown (Williamtown RAAF, Station 061078) (Bureau of Meteorology, 2024): • Maximum daily temperatures o 15 and 24 April 2024 – between 19.1˚C and 26.7˚C o 9 May 2024 – 21.4 ˚C o 31 July 2024 – 15.7 ˚C o 2 August 2024 – 17.0 ˚C • Cumulative rainfall o 15 and 24 April 2024 – 41.8 mm with most of the rainfall recorded on 21 April 2024 (23.4 mm) o 9 May 2024 – 1.2 mm o 31 July 2024 – 1.4 mm o 2 August 2024 – 4.8 mm.
Estate Management Works, Training Activities and/or Construction Works.	No estate management works, training activities or construction works were observed during the sampling event that would impact the sampling program.

5.2 Field Observations and Measurements

The observations and measurements recorded during the field activities for the April 2024 annual sampling event are summarised in **Table 8**, below.

Table 8 Field Observations and Measurements

Item	Description
Monitoring Well Network Condition	All wells sampled were observed to be in good condition with the exception of the following: • MW132S, MW146AD, MW168, MW172, MW188D, MW188S, MW255S, MW278S: well gatic lugs for bolts are rusted, however, the wells were still accessible. • MW150D: well gatic full of soft bentonite around j-cap, removed prior to opening the well for sampling. • MW166, MW169D, MW169S, MW201D, MW278: well gatic partly buried / covered with soil and at MW179D, covered by hessian barrier. Soil and debris were removed prior to sampling. • MW184S, MW198: well gatic lid missing. The lid at MW184S needs to be replaced, whereas at MW198, the gatic lid was removed for safety reasons due to the well located on airside, as it could not be secured firmly. • MW202D: well partially covered with asphalt / roadbase, which was removed prior to sampling.

Item	Description
	• MW169D, MW230S, MW231D, MW241D, MW241S, MW245D, MW245S, M252S, MW270D, MW270S, MW317D, MW317S: well gatics were full of water to below the top of casing or, in the case of MW231D, to above top of casing. The water was removed prior to sampling at each location. Given the J-caps were secure, water ingress into the wells was unlikely. Noting that during the resampling visit at MW241D and MW241S, no water was observed in the gatic. • MW208: well casing may be blocked based on gauged depth. Unable to dislodge any potential blockage. Despite the blockage, the groundwater was able to be sampled from within the screen interval, and therefore considered representative. • MW304, MW886: required redevelopment prior to installation of HydraSleeve™, based on sediment load and water quality parameters collected. • MW304: well gatic lid was rusted. • MW155, MW159D, MW159S, MW241D, MW241S, MW844: were redeveloped prior to completing the resampling in July 2024.
Water Observations	No visible signs of contamination were observed in the groundwater and surface water locations sampled. Sulphurous odours were noted at 38 groundwater locations (refer to **Table T2** in **Appendix B**) and two surface water locations (SW005 and SW014). Organic odours were noted at 17 groundwater locations (refer to **Table T2** in **Appendix B**) and two surface water locations (SW019 and SW600).
Depth to Groundwater and Flow Direction	During the sampling event, depth to groundwater ranged from 0.000 (MW231D, MW252S) and 3.769 (MW304) mbTOC, and groundwater elevation ranged between -0.063 (MW128S) and 8.180 (MW264S) metres Australian Height Datum (mAHD). Groundwater gauging data is presented in **Table T1** in **Appendix B**. The inferred groundwater flow direction is to the south and southeast, towards Tilligerry Creek and Fourteen Foot Drain, and is likely to the north and northeast, south of Tilligerry Creek, Fourteen Foot Drain and Ten Foot Drain (refer to **Figure F5-1** and **F5-2** in **Appendix A**), which was generally consistent with previous flow directions. Note that the groundwater elevation contours in **Figure F5-1** and **Figure F5-2** (in **Appendix A**) are based on the gauging of 29 selected wells on 19 April 2024 to minimise the potential for temporal variability.
Water Quality Parameters	Groundwater and surface water quality parameters were measured during the collection of water samples. The readings are presented in **Table T2** and **Table T3** in **Appendix B** and are summarised below: **Groundwater Quality Parameters** • Dissolved oxygen ranged from 0.02 mg/L (MW844) to 9.3 mg/L (MW121) indicating poor to well oxygenated conditions. • Electrical conductivity ranged from 5.0 µS/cm (MW169S, MW731D) to 25,702 µS/cm (MW147D) indicating fresh to saline conditions. • pH ranged from 4.19 (MW340S) to 7.88 (POT382) indicating acidic to neutral conditions. • ORP ranged from -5.2 mV (MW163) to 447.8 mV (MW886) indicating reducing to oxidising conditions. • Temperature ranged from 13.6˚C (MW132S) to 29.3˚C (MW241D).

Item	Description
	Surface Water Quality Parameters • Dissolved oxygen ranged from 1.44 mg/L (SW079) to 10.28 mg/L (SW048) indicating moderately to well oxygenated conditions. • Electrical conductivity ranged from 65.2 µS/cm (SW108) to 11,173 µS/cm (SW024) indicating fresh to saline conditions. • pH ranged from 4.21 (SW333) to 7.46 (SW023) indicating acidic to neutral conditions. • ORP ranged from 112 mV (SW600) to 488.3 mV (SW333) indicating mildly reducing to oxidising conditions. • Temperature ranged from 18.3˚C (SW259) to 28.3˚C (SW047).
Sediment Observations	Sediment sampled and logged during this monitoring event comprised sand, silt and clay materials with minor inclusions of gravels and trace shell fragments, and varying amounts of organic material (roots, leaves, grass). Organic odours were noted in 5 sediment locations (SD007, SD024, SD079, SD108, and SD600), and sulfuric odours were noted in 2 locations (SD005 and SD014). Refer to in **Table T4** in **Appendix B** for a summary of sediment classifications and observations.

5.3 Summary of Analytical Results

5.3.1 Groundwater Analytical Results

The groundwater PFAS analytical results from this sampling event are presented in **Table T5** in **Appendix B**. In summary, 133 primary groundwater samples were analysed for PFAS compounds, with concentrations of:

- PFOS+PFHxS, PFOS and/or PFOA reported above laboratory LOR in 91 primary samples
- PFOS+PFHxS and/or PFOA exceeding the adopted human health drinking water screening criteria in 67 primary samples
- PFOS+PFHxS and/or PFOA exceeding the adopted human health recreational water screening criteria in 31 primary samples
- PFOS and/or PFOA exceeding the adopted ecological screening criteria in 75 primary samples.

Deviations from the historical dataset are reported in **Table 9** and graphically on **Figure F6** in **Appendix A**.

Table 9 Deviations from Historical Dataset: Groundwater

Deviation Type	Groundwater sampling location	PFOS+PFHxS (µg/L)		PFOA (µg/L)		PFOS (µg/L)	
		Apr 2024	Previous maximum	Apr 2024	Previous maximum	Apr 2024	Previous maximum
First-time detections of PFOS+PFHxS PFOS and/or PFOA in groundwater	MW146AD	There were no first-time detections in the dataset.		0.04	<LOR	There were no first-time detections in the dataset.	
	MW201D	There were no first-time detections in the dataset.		0.05	<LOR	There were no first-time detections in the dataset.	
	MW257S	0.01	<LOR	There were no first-time detections in the dataset.		0.01	<LOR

	MW271D	There were no first-time detections in the dataset.		There were no first-time detections in the dataset.		0.03	<LOR
	MW340D*	There were no first-time detections in the dataset.		0.04	<LOR	There were no first-time detections in the dataset.	
	MW344D*	There were no first-time detections in the dataset.		0.02	<LOR	There were no first-time detections in the dataset.	

Deviation Type	Groundwater sampling location	PFOS+PFHxS (µg/L)		PFOA (µg/L)		PFOS (µg/L)	
		Apr 2024	Previous maximum	Apr 2024	Previous maximum	Apr 2024	Previous maximum
New exceedance of the NEMP (HEPA, 2020) drinking water guidelines in groundwater	MW731D*	There were no new exceedances of the NEMP Human Health (Drinking Water) Screening Criteria in the dataset.		0.58	0.16	There are no applicable NEMP Human Health (Drinking Water) Screening Criteria.	
	MW731S*	There were no new exceedances of the NEMP Human Health (Drinking Water) Screening Criteria in the dataset.		0.59	036	There are no applicable NEMP Human Health (Drinking Water) Screening Criteria.	
New exceedance of the NEMP (HEPA, 2020) recreational water guidelines in groundwater	MW146AD	2.47	0.28	There were no new exceedances of the NEMP Human Health (Recreational Water) Screening Criteria in the dataset.		There are no applicable NEMP Human Health (Recreational Water) Screening Criteria.	
	MW201D	5.92	0.56				
New exceedance of the NEMP (HEPA, 2020) Freshwater 99% guidelines in groundwater	MW257S	There are no applicable NEMP Ecological Screening Criteria (99%).		There were no new exceedances of the NEMP Ecological Screening Criteria (99%) in the dataset.		0.01	<LOR
	MW270D					0.02	<LOR
	MW271D					0.03	<LOR
Legend							
Blue Shading	Blue shading indicates sampling location with a first-time detection of PFOS+PFHxS, PFOS and/or PFOA						
Yellow Shading	Yellow shading indicates sampling location with a new exceedance of NEMP Human Health and/or Ecological Screening Criteria						
Note: MW340D, MW344D, MW731D and MW731S were sampled for the first time under the OMP scope during this sampling event and as such there is limited historical data associated with these locations.							

5.3.2 Surface Water Analytical Results

The surface water PFAS analytical results from this sampling event are presented in **Table T6** in **Appendix B**. In summary, 24 primary surface water samples were analysed for PFAS compounds, with concentrations of:

- PFOS+PFHxS, PFOS and/or PFOA reported above laboratory LOR in all 24 primary samples
- PFOS+PFHxS and/or PFOA exceeding the adopted human health recreational water screening criteria in 9 primary samples
- PFOS and/or PFOA exceeding the adopted ecological screening criteria in all 24 primary samples.

There were no first-time detections, or new exceedances of the adopted human health (recreational water) or ecological screening criteria for PFOS+PFHxS, PFOS and/or PFOA, in the surface water samples analysed.

5.3.3 Sediment Analytical Results

The sediment PFAS analytical results from this sampling event are presented in **Table T7** in **Appendix B**. In summary, 26 primary sediment samples were analysed for PFAS compounds, with

concentrations of PFOS+PFHxS, PFOS and/or PFOA reported above laboratory LOR in all 26 primary samples.

Deviations from the historical data set are provided in **Table 10** below and on **Figure F7** in **Appendix A**.

Table 10 Deviations from Historical Dataset - Sediment

Deviation Type	Sediment sampling location	PFOS+PFHxS (mg/kg)		PFOA (mg/kg)		PFOS (mg/kg)	
		Apr 2024	Previous maximum	Apr 2024	Previous maximum	Apr 2024	Previous maximum
First-time detections of PFOS+PFHxS PFOS and/or PFOA in sediment	SD333*	0.148	n/a	0.0012	n/a	0.123	n/a
	SD600	There was no first-time detection in the dataset.		0.0003	<LOR	There was no first-time detection in the dataset.	
Legend							
Blue Shading	Blue shading indicates sampling location with a first-time detection of PFOS+PFHxS, PFOS and/or PFOA						
n/a	Not applicable – no historical data available.						
Note: SD333 was sampled for the first time during this sampling event and as such it has no historical data. All detections were flagged as first-time detections.							

5.4 Historical Sampling Data

Historical groundwater, surface water and sediment sampling data are presented in **Table T8**, **Table T9** and **Table T10** (respectively) in **Appendix B**.

6.0 Summary and Next Sampling Events

6.1 Summary of Monitoring Event

The April 2024 annual sampling event was completed between 15 and 24 April 2024, with subsequent sampling visits on 9 May 2024 and 2 August 2024, and resampling on 31 July 2024. The findings and the recommended actions are summarised in **Table 11** below.

Table 11 Summary of Sampling Event

Item	Comment	Recommended Action
Access to sampling locations	The following were accessed and able to be sampled: • 133 groundwater locations • 24 surface water locations • 26 sediment locations	Nil.
Locations unable to be located, inaccessible or dry	Three residential groundwater bores (POT046, POT085 and POT236) were not able to be accessed and therefore not sampled. One surface water location (SW588) was dry and unable to be sampled.	AECOM will attempt to access and sample POT046, POT085, POT236 and SW588 during the next scheduled sampling event.
Monitoring well network condition	The monitoring wells that were able to be accessed and sampled were noted to be in good condition, with the exception of the following observed at some locations: • water in the well gatic below/above top of casing (MW169D, MW230S, MW231D, MW245D, MW245S, M252S, MW270D, MW270S, MW317D, MW317S) • well blocked/obstructed (MW208) • well gatic full of soft bentonite around j-cap (MW150D) • well gatic lid missing (MW184S, MW198) • well gatic lugs for bolts / gatic lid rusted (MW132S, MW146AD, MW168, MW172, MW188D, MW188S, MW255S, MW278S, MW304) • well gatic partly buried / covered with soil, roadbase and/or hessian barrier (MW166, MW169D, MW169S, MW179D, MW201D, MW202D, MW278) • wells redeveloped prior to HydraSleeve installation and/or resampling (MW155, MW159D, MW159S, MW241D, MW241S, MW304, MW844, MW886)	AECOM will attempt to complete the following during the next scheduled sampling event: • replace missing gatic lid for MW184S • unblock/remove obstruction from monitoring well MW208 All other monitoring well conditions were addressed during this sampling event.

Item	Comment	Recommended Action
Analytical Results	133 groundwater primary samples (excluding anomalous samples), 24 surface water primary samples and 26 sediment primary samples were analysed.	Locations will be sampled again during the next scheduled sampling event to continue to monitor concentrations over time.
First-time detections of PFOS+PFHxS, PFOS and/or PFOA	First-time detections of PFOS+PFHxS, PFOA and/or PFOS were reported in seven (MW146AD, MW201D, MW257S, MW270D, MW271D, MW340D, MW344D) of 133 groundwater locations sampled. No first-time detections of PFOS+PFHxS, PFOA and/or PFOS were reported in surface water locations sampled. First-time detections of PFOS+PFHxS, PFOA and/or PFOS were reported in two (SD333 and SD600) of 26 sediment locations sampled. It is noted that SD333 was sampled for the first time during this sampling event.	Locations will be sampled again during the next scheduled sampling event to continue to monitor concentrations over time.
New exceedance of adopted human health screening criteria	New exceedances of the adopted human health screening criteria for PFOS+PFHxS and/or PFOA were reported in four (MW146AD, MW201D, MW731D, MW731S) of 133 groundwater locations sampled. No new exceedances of the adopted human health screening criteria for PFOS+PFHxS and/or PFOA were reported in surface water locations sampled.	Locations will be sampled again during the next scheduled sampling event to continue to monitor concentrations over time.
New exceedance of adopted ecological screening criteria	New exceedances of the adopted ecological screening criteria for PFOS and/or PFOA were reported in three (MW257S, MW270D, MW271D) of 133 groundwater locations sampled. No new exceedances of the adopted ecological screening criteria for PFOS and/or PFOA were reported in surface water locations sampled.	Locations will be sampled again during the next scheduled sampling event to continue to monitor concentrations over time.

6.2 Upcoming Sampling Events

The next OMP sampling event is scheduled for September 2024.

6.3 Upcoming Ongoing Monitoring Report

The next Ongoing Monitoring Report is scheduled to be delivered in Q4 of 2024, covering data collected within the 12-month sampling period between January 2024 and December 2024.

Table T4 - Sediment Observations

Location Code	Alternative Name	Sampled Date Time	Sample Depth From (m)	Sample Depth To (m)	Sample Comment
SD001	MD1	24/04/2024 11:40	0.10	0.20	Silty CLAY: dark brown, low plasticity, saturated, with organic inclusions. No odour, no staining.
SD005	MD5	16/04/2024 15:38	0.10	0.20	Gravelly SAND: brown, medium to coarse grain, gravel subangular, trace silt, saturated. Sulfuric odour, no staining.
SD006	MD6	24/04/2024 12:15	0.20	0.30	Sandy CLAY: dark brown, fine grain sand, medium plasticity, saturated, with trace organic inclusions (rootlets). No odour, no staining.
SD007	MD7	24/04/2024 12:05	0.10	0.20	Sandy GRAVEL: brown, fine grain sand, coarse gravel, wet, with trace organic inclusions (rootlets). Organic odour, no staining.
SD009	MD8	22/04/2024 13:00	0.10	0.20	Clayey SAND: white with brown clay, medium grained, poorly graded, saturated, with organic inclusions (rootlets). No odour, no staining.
SD011	MD10	23/04/2024 14:00	0.10	0.20	SAND: grey, fine to medium grained, poorly graded, saturated, with trace organic inclusions (rootlets and leaves). No odour, no staining.
SD014	MD14	16/04/2024 15:25	0.10	0.20	Sandy SILT: brown, fine grain sand, low plasticity, saturated, with organic inclusions (roots and leaf litter). Sulfuric odour, no staining.
SD019	TC12	22/04/2024 11:15	0.10	0.20	Gravelly SILT: brown, fine grain with large gravels, wet, with trace organic inclusions (rootlets). No odour, no staining.
SD023	TC6A	16/04/2024 16:35	0.10	0.20	Silty CLAY: brown, low plasticity, saturated, with organic inclusions (rootlets). No odour, no sheen.
SD024	TC7	16/04/2024 16:39	0.10	0.20	Sandy SILT: brown, fine grain sand, high plasticity, with organic inclusions (roots and grass). Organic odour, no staining.
SD047	BD03	18/04/2024 9:40	0.20	0.30	Silty SAND: light grey with brown silt, medium grained, poorly graded, saturated, with organic inclusions (rootlets). No odour, no staining.
SD048	BD04	18/04/2024 11:50	0.20	0.30	Sandy SILT: brown, fine to medium grain sand, low plasticity, with organic inclusions (roots and grass). No odour, no staining.
SD055	DD1	17/04/2024 15:20	0.10	0.20	Sandy SILT: brown, fine grain sand, no plasticity, moist, with organic inclusions (roots and grass). No odour, no staining.
SD059	DD2	16/04/2024 13:45	0.10	0.20	SAND with silt: white to grey with black silts, medium-coarse grained, poorly graded, low plasticity, saturated. No odour, no staining.
SD060	DD3	22/04/2024 12:30	0.10	0.20	Silty SAND: grey to brown, fine grain sand, saturated, with trace organic inclusion (rootlets). No odour, no staining.
SD062	DD5	22/04/2024 12:18	0.10	0.20	Sandy SILT: brown, fine grain, saturated. No odour, no staining.
SD079	TC2	16/04/2024 9:48	0.10	0.20	Sandy SILT: brown, fine grain sand, low plasticity, with organic inclusions (roots and grass). Organic odour, no staining.
SD081	TFD1	23/04/2024 12:55	0.10	0.20	Gravelly SILT: brown, medium to large grain inclusions, low plasticity. No odour, no staining.
SD108	LC	18/04/2024 11:27	0.20	0.30	Sandy SILT: brown, fine grain sand, no plasticity, saturated, with organic inclusions (roots and grass). Organic odour, no staining.
SD110	LC_B	18/04/2024 11:32	0.10	0.20	Silty SAND: light grey with dark brown silt, medium grain, poorly graded, saturated, with organic inclusions. No odour, no staining.
SD254	FC1A	23/04/2024 8:40	0.10	0.20	Silty CLAY: brown, medium plasticity, with trace organic inclusions (rootlets). No odour, no staining.
SD255	FC1B	23/04/2024 8:35	0.10	0.20	SAND: grey to brown, with organic inclusions (shells and some rootlets). No odour, no staining.
SD259	FCD4	23/04/2024 8:25	0.10	0.20	Sandy SILT: brown and grey, fine grain, no plasticity, saturated. No odour, no staining.
SD326	FC1C	23/04/2024 8:45	0.20	0.30	Sandy CLAY: brown with white sand, fine grain, no plasticity, with trace inclusions (small shell fragments). No odour, no staining.
SD333		22/04/2024 15:50	0.10	0.20	Sandy CLAY: dark brown, fine grains, saturated, with trace organic matter (rootlets). No odour, no staining.
SD600		22/04/2024 14:05	0.20	0.30	Silty CLAY: dark brown, fine grain, saturated, with trace organic inclusions (rootlets). Organic odour, no staining.

Notes

LOR	Limit of Reporting
Normal	Primary sample
Field_D	Intra-laboratory duplicate sample
Interlab_D	Inter-laboratory duplicate sample
	Denotes first-time detection above LOR
	Denotes new exceedence of human health and/or ecological screening criteria

Notes

LOR	Limit of Reporting
Normal	Primary sample
Field_D	Intra-laboratory duplicate sample
Interlab_D	Inter-laboratory duplicate sample
	Denotes first-time detection above LOR
	Denotes new exceedence of human health and/or ecological screening criteria

Calibration Certificates

Certificate of Service and Calibration
Interface Meter
Heron H.Oil

Company Name	WAM Scientific
Office Address	26 Bungarra Crescent, Chipping Norton NSW 2170
Phone Number	+61 405 241 484
Contact Name	[redacted]
Instrument	Heron H.Oil Interface Meter (60m)
Serial Number	01-7947
Client Name	[redacted]
Project Number	60612562_2.1

Instrument Check			
Item	Test	Test Passed	Comments
9V Battery	Klein Tools MM300 Multimeter	✓	Battery voltage reading above 7.9V
Battery Box	Check	✓	No damage
Face and Back Plates	Check	✓	No damage
Thumb Screws	Check	✓	Rubber ends intact
Tape Hangar/Protector	Check	✓	No damage
On/Off Button	Operation	✓	Button is functional
Buzzer	Operation	✓	Intermittent tone in H_2O, solid tone in product
LED Signal Light	Operation	✓	LED light functional – green and red
Probe	Operation/Check	✓	Decontaminated, cleaned and tested
Tape	Condition/Check	✓	Decontaminated and cleaned, no damage
Connection	Check	✓	Probe and link connected correctly and tightly
PCB	Operation	✓	Unit is fully functional
Electronics Panel	Orientation	✓	Correctly aligned

Instrument Readings		
Product	Buzzer	LED Light
H_2O	Intermittent	Blinking – Red
Petroleum	Solid	Steady – Red

Declaration
WAM Scientific certifies that the above instrument was successfully tested according to manufacturer's standards and all necessary checks were conducted to ensure the instrument was fully operational prior to dispatch. The interface meter was decontaminated, cleaned and tested with a mixture of tap water and petrol, shielded from ambient light.

Instrument Check

Item	Test	Test Passed	Comments
2 x Alkaline C-size Batteries	Klein Tools MM300 Multimeter	✓	Both batteries reading above 2.9V
Battery Saver Function	Operation	✓	Automatically turns off after 60 minutes if idle
Unit Display	Operation	✓	Screen visible, no damage
Keypad	Operation	✓	Responsive, no damage
Connection Port and Cable	Condition/Check	✓	Clean, no damage
Monitor Housing	Condition/Check	✓	No damage
Firmware	Version	✓	4.0.0
pH Probe	Condition/Calibration	✓	Calibrated and conforms to manufacturer's specs
pH millivolts for pH 7.00	Calibration	✓	pH 7.00 calibration range between 0 mV ± 50 mV
pH millivolts for pH 4.00	Calibration	✓	pH 4 mV range +165 to +180 from 7 buffer mV value
pH slope	Calibration	✓	Range between 55 to 60 mV/pH (ideal value 59 mV)
Response time < 90 seconds	Calibration	✓	Responds to correct value within 90 seconds
ORP Probe	Condition/Calibration	✓	Calibrated and conforms to manufacturer's specs
ORP Reading	Calibration	✓	Within ± 80 mV of reference Zobell Reading
Response time < 90 seconds	Calibration	✓	Responds to correct value within 90 seconds
Conductivity/Temp Probe	Condition/Calibration	✓	Calibrated and conforms to manufacturer's specs
Conductivity Cell	Calibration	✓	Conductivity cell constant 5.0 ± 1.0 in GLP file
Clean Sensor Readings	Calibration	✓	Clean sensor reads less than 3 uS/cm in dry air
Dissolved Oxygen Probe	Condition/Calibration	✓	Calibrated and conforms to manufacturer's specs
DO Cap	Condition/Calibration	✓	1.25 mil PE membrane (yellow membrane)
DO Sensor in Use	Condition	✓	Polarographic DO sensor
DO Sensor Value	Calibration	✓	(min 4.31 uA - max 8.00 uA) Avg 6.15 uA

Instrument Readings

Parameter	Standard Used	Reference No.	Calibration Value	Observed	Actual	Units
Temperature	Centre 370 Thermometer	Room Temp.	16.5	16.7	16.5	°C
pH	pH 4.00	386466	4.01	3.96	4.01	pH
pH	pH 7.00	387329	7.00	6.96	7.00	pH
Conductivity	2760 µs/cm at 25°C	388521	2760	2750	2760	µs/cm
ORP (Ref. check only)	Zobell A & B	380835/382785	248.0	235.7	248.0	mV
Zero Dissolved O_2	$NaSO_3$ in Distilled H_2O	389912	0.0	0.7	0.0	%
100% Dissolved O_2	100% Air Saturated H_2O	Fresh Air	100.0	99.5	100.0	%

Declaration

WAM Scientific certifies that the above instrument was successfully tested according to manufacturer's standards and all necessary checks were conducted to ensure the instrument was fully operational prior to dispatch. The calibration data supplied was obtained in accordance with manufacturer's specifications using solutions of known values.

FQM - Water Quality Meter Calibration Record

Q4AN(EV)-410-FM1

Project Name:	OMP WLM	**Project Number:**	60612562 - 2.1
Project Location:	WLM	**Client:**	DoD
PM Name:	[redacted]	**Fieldwork Staff Name:**	[redacted]

This calibration record is intended to prompt fieldwork staff to calibrate water quality meter (WQM) daily before the start of fieldworks.

INSTRUMENT DETAILS

Supplier:	WAM
Make and Model:	YSI ~~Prof Plus~~ Pro Quatro
Serial Number:	20L105295

CALIBRATION

CALIBRATE WITH CALIBRATION SOLUTIONS

Date and Time:					
Parameter	Acidity		Conductivity	Dissolved Oxygen	
Units	pH	pH	µS/cm	ppm	ppm
Calibration Standard Concentration:					
Calibration Reading:					
Calibration Temperature:					

ONGOING CHECKS

BUMP TEST WITH CALIBRATION SOLUTION

Date and Time:	19/4 07:30				
Parameter	Acidity		Conductivity	Dissolved Oxygen	
Units	pH	pH	µS/cm	ppm	ppm
Calibration Standard Concentration:	7.00	4.01	2760	0	
Bump Test Reading:	7.01	4.05	2770	0.4	
Bump Test Temperature:	24.4	24.4	24.5	24.5	

COMMENTS

Detail any equipment faults, minor maintenance performed, change of batteries or technical support provided.

Approval and Distribution

☑ Each individual instrument has been inspected and calibrated daily and bump tested as required by fieldwork staff.

FQM - Water Quality Meter Calibration Record

Q4AN(EV)-410-FM1

Project Name:	OMP WLM	**Project Number:**	60612562 - 2.1
Project Location:	WLM	**Client:**	DoD
PM Name:	[redacted]	**Fieldwork Staff Name:**	[redacted]

This calibration record is intended to prompt fieldwork staff to calibrate water quality meter (WQM) daily before the start of fieldworks.

INSTRUMENT DETAILS

Supplier:	WAM
Make and Model:	YSI Pro Quattro
Serial Number:	20L105295

CALIBRATION

CALIBRATE WITH CALIBRATION SOLUTIONS

Date and Time:					
Parameter	Acidity		Conductivity	Dissolved Oxygen	
Units	pH	pH	µS/cm	ppm	ppm
Calibration Standard Concentration:					
Calibration Reading:					
Calibration Temperature:					

ONGOING CHECKS

BUMP TEST WITH CALIBRATION SOLUTION

Date and Time:	16/4 07:35				
Parameter	Acidity		Conductivity	Dissolved Oxygen	
Units	pH	pH	µS/cm	ppm	ppm
Calibration Standard Concentration:	7.04	4.00	2127	0	
Bump Test Reading:	7.05	4.04	2111	0.05	
Bump Test Temperature:	13.3	12.4	13.5	13.5	

COMMENTS

Detail any equipment faults, minor maintenance performed, change of batteries or technical support provided.

Approval and Distribution

☑ Each individual instrument has been inspected and calibrated daily and bump tested as required by fieldwork staff.

Laboratory:	Primary: ALS, Secondary: Envirolab				
Lab reference:	ALS: ES2413422, ES2413423, ES2413424, ES2413425, ES2413427, ES2413429, ES2413430, ES2413431, ES2413432, ES2413433, ES2413434, ES2413435, ES2413562, ES2415053, ES2415054, ES2424957, ES2425225. Envirolab: 349756, 358167.				
Key Issues:	No QA/QC issues were identified in the field or laboratory datasets that could have a material implication to decision-making on the project.				

Field Quality Assurance and Quality Control

Field DQOs and DQIs

The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2024).

Sampling personnel

The main sampling event was conducted between 15/04/2024 and 24/04/2024 by suitably qualified and experienced AECOM Environmental Scientists and Engineers. Additional mobilisations were undertaken by the same team on the following dates:

- 09/05/2024 (sampling MW731D and POT144),
- 31/07/2024 (resampling MW155, MW159D/S, MW241D/S, MW844); and
- 02/08/2024 (sampling MW731S).

Sampling Methodology

All water and sediment samples were collected in accordance with the methodology outlined in the SAQP (AECOM, 2024), with the exception of MW245S which was sampled with a bailer as a result of a HydraSleeve™ non-deployment.

After each sample was collected, reusable equipment was decontaminated using Liquinox and potable water, and the consumables (nitrile gloves and HydraSleeve™ material) were disposed of in waste bins.

Chain of Custody (COC)

All samples collected were reported on the Chain of Custody documents (COC) and subsequent email amendments and analysed for requested analytes.

Rinsate Blank

Rinsate blank samples were collected at a frequency of 1 per day of sampling per sampling team where equipment was re-used and decontaminated between sample points (a total of nine samples were collected). Rinsate blank samples were either collected from the final rinse of the interface probe or the trowel, using laboratory-supplied de-ionised water.

Frequency of field QC

Field duplicates (intra-laboratory duplicates) were collected at the required frequency of 1 in 10 primary samples (10%), for water and soil samples collectively. Field triplicates (inter-laboratory duplicates) were collected marginally below the required frequency of 1 in 10 primary samples (10%), for water and soil samples collectively due to field error. Overall, 19 field duplicates and 18 field triplicates were collected for 189 primary samples, these comprised:

- 17 water field duplicates and 16 water field triplicates were collected for 163 primary water samples (10.4% and 9.8% frequency, respectively).
- 2 sediment field duplicates and 2 sediment field triplicates were collected for 26 primary sediment samples in total (13% frequency for both).

The precision of the data can be assessed as acceptable based on the available intra-laboratory duplicate RPDs and the laboratory duplicate RPDs which were reported at or above the required frequencies and within control limits.

Handling and preservation	All samples were received at the primary laboratory and secondary laboratory in appropriate containers with temperatures between 0.9°C to 3.2°C (with ice present), within the recommended temperature range (<6°C).
Calibration of equipment	Measurements of water geochemical parameters were undertaken using YSI Professional Plus water quality meters, which were calibrated by the supplier prior to use, in accordance with the manufacturer's instructions and bump tested daily by the field personnel. Measurements of depth to groundwater were undertaken using interface probes, which were serviced by the supplier prior to use. All equipment calibration and service certificates are presented in Appendix C.
Laboratory QA/QC	
Laboratory DQOs and DQIs	The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2024).
Tests requested/reported	All samples were analysed for per- and polyfluoroalkyl substances (PFAS) extended suite, at the standard level of detection. All sample requests for analysis are reported on the Chain of Custody (COC) and subsequent email amendments.
Holding time compliance	All samples were extracted and analysed by the laboratory within the recommended holding times.
Laboratory accreditation	The primary laboratory analysis was conducted by ALS Environmental Pty Ltd (Sydney) a National Association of Testing Authorities (NATA) accredited laboratory (Accreditation No. 825). The secondary samples were analysed at Envirolab Services, also a NATA accredited laboratory (accreditation number 2901).
Frequency of laboratory QC	The primary laboratory ALS reported a sufficient frequency of quality control samples to assess whether the results have been reported with acceptable accuracy and precision.
Method Blank	All method blank concentrations were reported <LOR (limit of reporting) for the analytes tested, meeting the project requirements. This is presented in the Quality Control Reports for both laboratories.
Laboratory duplicate RPDs	The reported laboratory duplicate's Relative Percentage Differences (RPDs) were within laboratory control limits. The laboratory duplicate RPDs are presented in the Quality Control Reports for both laboratories.
LCS recovery	Laboratory control spike (LCS) recoveries were within control limits. This is presented in the Quality Control Reports for both laboratories.
Matrix spike recovery	Matrix spike (MS) recoveries were reported within control limits, with the exception of matrix spike recoveries that were not determined for the following: • ES2413427: Perfluorohexane sulfonic acid (PFHxS), Anonymous • ES2413427: Perfluorooctane sulfonic acid (PFOS), Anonymous, 0908_MW201D_240417 • ES2413427: Perfluorohexanoic acid (PFHxA), Anonymous • ES2413562: PFHxS, 0908_SD001_240424 • ES2413562: PFOS, 0908_SD001_240424, 0908_SW009_240422 • ES2413423: PFHxS, Anonymous • ES2413423: PFOS, Anonymous • ES2413423: PFHxA, Anonymous • ES2413422: PFHxS, 0908_MW104S_240424

- ES2413422: PFOS, 0908_MW104S_240424
- ES2413422: PFHxA, 0908_MW104S_240424
- ES2413425: PFHxS, Anonymous
- ES2413425: PFOS, Anonymous
- ES2413425: PFHxA, Anonymous
- ES2413424: PFHxS, Anonymous
- ES2413424: PFOS, Anonymous
- ES2413424: PFHxA, Anonymous

These non-determinations were due to background levels being greater than or equal to four times spike levels, which do not reflect method bias or affect data interpretation.

Surrogate spike recovery — The reported surrogate spike recoveries were within laboratory control limits.

QA/QC Data Evaluation

Comparison of Field Observations and Laboratory Results — No anomalies between field observations and analytical results were noted.

Anomalous data — Resampling was conducted at monitoring wells MW155, MW159D, MW159S, MW241D, MW241S and MW844 in July 2024, following the initial reporting of PFAS concentrations outside of historical ranges. The resampling results from July 2024 confirmed that the originally reported result from April 2024 (see table below) were anomalous and therefore are not used in this report. The reason for the discrepancies is unknown.

Location Code	Date	Perfluoro-octanoic acid (PFOA) Result	PFOS Result	PFHxS Result	PFOS+PFHxS Result
MW155	17 Apr 2024	0.10	0.38	2.58	2.96
	31 Jul 2024	0.02	0.55	0.21	0.76
MW159S	22 Apr 2024	<0.01	0.09	0.04	0.13
	31 Jul 2024	0.02	<0.01	0.02	0.02
MW159D	22 Apr 2024	0.09	0.35	2.19	2.54
	31 Jul 2024	<0.01	<0.01	<0.01	<0.01
MW241D	23 Apr 2024	<0.01	0.01	<0.01	0.01
	31 Jul 2024	<0.01	<0.01	<0.01	<0.01
MW241S	23 Apr 2024	<0.01	<0.01	0.01	0.01
	31 Jul 2024	<0.01	<0.01	<0.01	<0.01
MW844	23 Apr 2024	<0.01	0.02	<0.01	0.02
	31 Jul 2024	<0.01	<0.01	<0.01	<0.01

Note: the sample results are still available in the Defence database with a note to indicate that they are anomalous, and that resampling was undertaken in July 2024.

Data transcription — A check of the laboratory results identified no anomalies within the electronic data, the laboratory reports, and the tables generated by AECOM.

Limits of reporting — With the exception of the PFAS NEMP Freshwater 99% species protection (HEPA 2020) values for PFOS, the laboratory LORs were sufficiently low to enable assessment against adopted guideline criteria.

Rinsate Blank sample results — The concentrations of PFAS in the Rinsate Blank samples (Table D3) were below the LOR, indicating decontamination procedures were adequate.

DATA VALIDATION REPORT

RPDs for Field Duplicates / Triplicates	RPDs for field duplicates (intra-laboratory duplicates) and triplicates (inter-laboratory duplicates) were reported within acceptable limits (≤30%, or ≤50% for results 10-20 x LOR, or No Limit for results <10 x LOR) (see Table D1 and Table D2), with the exception of: Intra-laboratory duplicates (Field Duplicates) RPDs • MW897D/QC111: 40% PFOS. Inter-laboratory duplicates (Field Triplicates) RPDs • SD005/QC205: 34% for PFOS. The elevated RPDs were marginally above acceptable limits and within the same order of magnitude, and therefore considered acceptable. Where required for quantitative purposes, the highest concentrations from the primary and duplicate pairs were used in the report.
Overall Assessment	
	Data validation procedure employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	ES2413422--002	0908_MW104S_240424	**Perfluorohexane sulfonic acid (PFHxS)**	355-46-4	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231A: Perfluoroalkyl Sulfonic Acids	ES2413422--002	0908_MW104S_240424	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231B: Perfluoroalkyl Carboxylic Acids	ES2413422--002	0908_MW104S_240424	**Perfluorohexanoic acid (PFHxA)**	307-24-4	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **WATER**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sub-Matrix: **WATER**

Project	: NSW_0908_PFASOMP_24	Date Samples Received	: 24-Apr-2024
Site	: Offsite 9	Issue Date	: 02-May-2024
Sampler	: [redacted]	No. of samples received	: 2
Order number	: 60612562_8.1	No. of samples analysed	: 2

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	ES2413422--002	Anonymous	**Perfluorohexane sulfonic acid (PFHxS)**	355-46-4	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231A: Perfluoroalkyl Sulfonic Acids	ES2413422--002	Anonymous	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231B: Perfluoroalkyl Carboxylic Acids	ES2413422--002	Anonymous	**Perfluorohexanoic acid (PFHxA)**	307-24-4	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)		Sample Date	Extraction / Preparation			Analysis		
			Date extracted	Due for extraction	Evaluation	Date analysed	Due for analysis	Evaluation

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	*Method*	*QC*	*Regular*	***Actual***	***Expected***	*Evaluation*

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Matrix: **WATER**

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	ES2413422--002	Anonymous	**Perfluorohexane sulfonic acid (PFHxS)**	355-46-4	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231A: Perfluoroalkyl Sulfonic Acids	ES2413422--002	Anonymous	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Analytical Results

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	*Position*	*Accreditation Category*

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
RPD = Relative Percentage Difference
# = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	ES2413422--002	Anonymous	**Perfluorohexane sulfonic acid (PFHxS)**	355-46-4	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231A: Perfluoroalkyl Sulfonic Acids	ES2413422--002	Anonymous	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231B: Perfluoroalkyl Carboxylic Acids	ES2413422--002	Anonymous	**Perfluorohexanoic acid (PFHxA)**	307-24-4	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Method / Container / Client Sample ID(s)		Sample Date	Extraction / Preparation			Analysis

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
  - Sample Container(s)/Preservation Non-Compliances
  - Summary of Sample(s) and Requested Analysis
  - Proactive Holding Time Report
  - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Analytical work for this work order will be conducted at ALS Sydney.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- **No sample container / preservation non-compliance exists.**

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.
If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO Method Blank value outliers occur.**
- **NO Duplicate outliers occur.**
- **NO Laboratory Control outliers occur.**
- **Matrix Spike outliers exist - please see following pages for full details.**
- **For all regular sample matrices, where applicable to the methodology, NO surrogate recovery outliers occur.**

Outliers : Analysis Holding Time Compliance

- **NO Analysis Holding Time Outliers exist.**

Outliers : Frequency of Quality Control Samples

- **NO Quality Control Sample Frequency Outliers exist.**

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	ES2413422--002	Anonymous	**Perfluorohexane sulfonic acid (PFHxS)**	355-46-4	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231A: Perfluoroalkyl Sulfonic Acids	ES2413422--002	Anonymous	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231A: Perfluoroalkyl Sulfonic Acids	ES2413427--055	0908_MW201D_240417	**Perfluorooctane sulfonic acid (PFOS)**	1763-23-1	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**
EP231B: Perfluoroalkyl Carboxylic Acids	ES2413422--002	Anonymous	**Perfluorohexanoic acid (PFHxA)**	307-24-4	Not Determined	----	**MS recovery not determined, background level greater than or equal to 4x spike level.**

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for ***VOC in soils*** vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: × = Holding time breach ; ✓ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: × = Quality Control frequency not within specification ; ✓ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by Solid Phase Extraction (SPE) followed by LC-Electrospray-MS-MS, Negative Mode using MRM and internal standard quantitation. Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures and data quality objectives conform to US DoD QSM 5.4, table B-15 requirements.

Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
LOR = Limit of reporting
^ = This result is computed from individual analyte detections at or above the level of reporting
ø = ALS is not NATA accredited for these tests.
~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- Amendment (12/07/2024): This report has been amended as a result of a request to change sample identification numbers (IDs) received from Sidnee Harris on 12/07/2024, for samples ES2413427-001 and 102. All analysis results are as per the previous report.
- Amendment (11/07/2024): This report has been amended to alter the sampling times for Sample ES2413427-010, 018, 019, 080, 081, 108, 131, and 132. All analysis results are as per the previous report.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per tables in USEPA 1633 where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.
