Executive Summary

Introduction

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the Ongoing Monitoring Plan (OMP) for monitoring of per- and poly-fluoroalkyl substances (PFAS) at the Royal Australian Air Force (RAAF) Base Williamtown (the 'base') in New South Wales (NSW).

Objective

The objective of implementing the OMP is to provide information on changes in location and concentrations of PFAS within the environment. The data is required to assist risk management decisions by Defence and NSW State Government agencies to protect human health and the environment.

Monitoring Scope

AECOM completed two monitoring events of groundwater, surface water and sediment between January 2025 and December 2025 (the 'monitoring period') in accordance with the Sampling and Analysis Quality Plans (SAQP) (AECOM, 2025a & 2025d). This monitoring targeted PFAS associated with the fire-fighting foams used at the base historically.

Monitoring Results

Groundwater

As specified in the OMP, groundwater sampling in this monitoring period focused on locations at identified PFAS source areas on-base, locations at the base boundary, and off-base within the Management Area, as defined by the NSW Government.

Overall, the concentrations of PFAS in groundwater were similar to those reported in previous monitoring periods. At several on-base PFAS source areas, 'decreasing' trends were observed, indicating that targeted treatment of on-base source areas continues to reduce the amount of PFAS in the environment.

New maximum concentrations were observed at some off-base monitoring locations in the Primary Management Zone south of the base suggesting the core of the plume continues to migrate away from source areas in the Central Region of the base towards Fullerton Cove. Statistically increasing or decreasing trends were observed in a number of locations on-base and across the Williamtown Management Area, however as concentrations continue to remain within the same order of magnitude as historical results they are not considered to be significant in the context of the conceptual site model. With the exception of a minor refinement in the inferred eastern extent of the plume near Salt Ash (due to the adopted lower laboratory limit of reporting) the shape of the groundwater plume remains relatively consistent with the extents identified during the 2017 Detailed Site Investigation (AECOM, 2017a).

First-time detections of PFAS were reported at eight locations either within the off-base Broader Management Zone and/or outside of the Williamtown Management Area. These first-time detections were largely attributed to the adoption of a lower level of laboratory reporting, rather than being indicative of plume migration. New exceedances of human health screening criteria and/or ecological screening criteria were reported in nine off-base groundwater locations within the Primary Management and Secondary Management Zones. However, the findings were reviewed against OMP triggers and were found to present no additional risks to people or the environment.

Surface Water and Sediment

Co-located surface water and sediment samples were collected on-base and off-base during the monitoring period, and focussed on identified PFAS-source areas, the base boundary and key drains within the off-base Management Area.

PFAS concentrations were similar to historical results. The highest PFAS concentrations were associated with on-base source areas and drains flowing from the base, including those in the Primary Management Zone where groundwater enters into surface water drains.

Concentrations of Perfluorooctanesulfonic Acid+ Perfluorohexanesulfonic Acid (PFOS+PFHxS) and Perfluorooctanoic Acid (PFOA) remained within or the same order of magnitude of historical ranges with no consistent trends observed in the dataset and present no further risks to people or the environment.

Conceptual Site Model and Risk Summary

The Conceptual Site Model (CSM) is used to describe the ways that PFAS moves from source areas on the base into the surrounding environment. Specifically, the CSM describes the links between PFAS sources, transport pathways, and possible exposure scenarios. The CSM was developed during the investigation stages and the most recent CSM is summarised in the PFAS Management Area Plan (PMAP) (Defence, 2023b).

The risk profile was established by the Human Health Risk Assessment (HHRA) (AECOM, 2017b) and Ecological Risk Assessment (AECOM, 2018) and is summarised in the PMAP (Defence, 2023b).

While there have been localised changes in PFAS concentrations during the monitoring period, the risk profile and CSM associated with exposure to PFAS in groundwater, surface water and sediment have not changed.

What is an 'order of magnitude'?

This refers to something decreasing or increasing by multiples of ten. For instance, an increase from 10 to 100 is an order of magnitude increase. When assessing changes in PFAS concentrations at an individual location, all concentrations are considered when determining trends, but order of magnitude changes are discussed separately as they represent a significant change in concentrations from what was reported in the previous event.

If a change is close to established health or environmental criteria, it will also be considered significant.

Remediation Progress

Defence continued remediation actions at the base to reduce PFAS mass discharge across the base boundary, in accordance with the PMAP (Defence, 2023b). During the monitoring period:

- The three water treatment plants on-base removed approximately 4.1 kg of PFAS from the environment (groundwater and surface water)
- The decreasing trends in groundwater concentrations at selected wells in the northern portion of the Western Region is likely to be attributable to the soil remediation and ongoing groundwater treatment at the former fire training area
- The former fire training area water treatment plant in the Western Region ceased operation on 14 November 2025. The plant was upgraded and the extraction was moved to the southern boundary within the Western Region to target the PFAS plume that originated from the former fire training area. While new maximum and/or increasing concentrations of PFAS have been identified in groundwater in the Western Region, the newly commissioned Western Region pump and treat system will aim to minimise the mass of PFAS migrating beyond base boundary in groundwater.
- Defence is also planning to implement additional management actions to target the central plume, including a pump and treat system (scheduled to be installed in late 2026) at Cabbage Tree Road which will aim to reduce the PFAS mass entering the receiving environment at Fullerton Cove.
- Investigations at the former and current fire station (Facility 165) and the Eastern Region were completed, the findings of which are being used to inform remedial planning in 2026
- The investigations for the in-ground permeable barrier to trial the treatment of groundwater commenced along the southern edge of Lake Cochran
- The investigations along Dawsons Drain commenced, looking at quantifying the contribution of PFAS from groundwater from the Western Region to surface water from Lake Cochran to Dawsons Drain
- Whilst remediation progress continues across the base, the management of risks to PFAS continues to be undertaken in accordance with the actions outlined in the PMAP.

1.0 Introduction

AECOM Australia Pty Ltd (AECOM) was engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) at Royal Australian Air Force (RAAF) Base Williamtown (the 'base') in New South Wales (NSW). The location of the base and surrounding areas is shown in **Figure F1** in **Appendix A**.

The monitoring targeted PFAS in a range of environmental media at selected locations on-base and in surrounding off-base areas, including the Management Area as defined by the NSW State Government (**Figure F1** in **Appendix A** and NSW Government released figure in **Appendix D**).

In order to meet the objectives of the OMP, the monitoring was undertaken in accordance with the *Sampling and Analysis Quality Plan* (SAQP) (AECOM, 2025a and 2025d). Concurrent programs of work being delivered by Defence outside of this monitoring program were also considered. A summary of these ancillary works is presented in **Section 6.0**.

This Ongoing Monitoring Report (OMR) has been prepared in accordance with the *Ongoing Monitoring Program Reporting – Guidance* (Defence, 2024) based on monitoring data collected between January 2025 and December 2025 (the 'monitoring period').

1.1 Objective

The objective of the monitoring program is to identify and evaluate:

- spatial and temporal (including seasonal) variability of PFAS in the environment
- changes to sources, transport pathways and/or receptors, described as a Conceptual Site Model (CSM) for the base
- whether risks to human and ecological receptors require review
- the influence that risk management activities at the base, as outlined in the PFAS Management Area Plan (PMAP) (Defence, 2023b) have had on PFAS in the environment
- whether the identified changes trigger an action and or review.

The data collected may be used to inform where new risk management actions may be required, or to support a determination that remediation has been completed so far as reasonably practicable.

1.2 Scope

The scope of works for this OMR included assessing changes to the distribution of PFAS over the monitoring period and if these changes have implications for the understanding of the CSM and the associated risk profile. This included the evaluation of data reported during the monitoring period in the following reports which are included in **Appendix H**:

- *Sampling Event Report, April 2025, PFAS OMP – RAAF Base Williamtown*. 29 August 2025 (AECOM, 2025c)
- *Sampling Event Report, October 2025, PFAS OMP – RAAF Base Williamtown*. 15 December 2025 (AECOM, 2025e).

The OMR also considers historical OMP data and PFAS data collected outside the OMP.

2.0 Site setting

2.1 Site description

The site identification and setting are summarised in **Table 1** below:

Table 1 Site identification and setting summary

Element	Description
Site ID	0908
Site location	The base is located at Medowie Road, approximately 15 km north of the Newcastle NSW central business district and is located in the Port Stephens local government area, as shown in Figure F1 in Appendix A .
Regional meteorology	The Bureau of Meteorology (BoM) Williamtown RAAF weather station (number 061078) has recorded data since 1942. Review of the BoM data for the monitoring period indicates the following: - mean monthly maximum temperatures varied from 17.5°C in June 2025 to 28.9°C in December 2025 - mean monthly minimum temperatures varied from 7.9°C in June and July 2025 to 19.1°C in March 2025 - The rainfall recorded at the base was 1,721.8 mm during the monitoring period. Assessment of rainfall during the monitoring period against the mean rainfall is presented in Section 6.4. In summary, the recorded rainfall was noted to be above the mean for the majority of the monitoring period (including during the annual event in April 2025), but lower during the last three months of 2025 (covering the biannual event in October 2025). - The mean rainfall for all years on record was 1,134.4 mm per annum. The lowest recorded annual rainfall was 541 mm in 1980, and the highest annual rainfall was 1,794 mm in 1963. The highest monthly rainfall generally occurs between January and June (averaging 115 mm per month), with the lowest rainfall in July to December (averaging 74 mm per month) (BoM, 2026).
Topography and hydrology	The base and Management Area are situated in a generally low-lying area associated with the Lower Hunter River. The region is characterised by low sand dunes, sand sheets and estuarine mud flats. The overall change in elevation across the base and Management Area is less than 10 m (AECOM, 2017a). The base is surrounded by an interconnected network of drains, rivers, estuaries, reservoirs and coastal waterbodies within the catchment areas of both the Hunter River and Port Stephens estuary. The major elements of the regional surface water drainage network include: - Dawsons Drain, the Fourteen Foot Drain and the Ten Foot Drain, which are located to the south of the base and drain into Fullerton Cove (Figure F1 in Appendix A). - Moors Drain and Tilligerry Creek, which are located to the east and southeast of the base and drain to the northeast into the Tilligerry Creek arm of Port Stephens (Figure F1 in Appendix A). Additionally, the following regional waterbodies are present in the area:

Element	Description
	- Grahamstown Dam located approximately 2 km northwest of the base. - Campvale Drain located 1.5 km to the north of the base. - Tilligerry Creek estuary located approximately 6 km to the east. - Port Stephens located approximately 10 km northeast. - Fullerton Cove located approximately 3 km to the southwest. - Hunter River Estuary located approximately 7 km southwest and west. - Pacific Ocean located approximately 4.5 km to the south/southeast.
Geology and hydrogeology	The geology of the base and Management Area comprises unconsolidated sands (Tomago Sand Beds and Stockton Sand Beds) underlain by estuarine sediments (Tilligerry Mud Member). The hydrogeology of the area is characterised by two unconfined sand aquifers: - Tomago Sand Beds aquifer located northwest of Tilligerry Creek. - Stockton Sand Beds aquifer located between Tilligerry Creek and the Newcastle Bight. The Tomago Sand Beds aquifer is highly permeable and readily infiltrated by rainwater owing to the nature of the relatively coarse-grained aquifer material and shallow water table. The aquifer in the Stockton Sand Beds is approximately 10 to 20 m thick and is composed primarily of sands. PFAS source areas on the base are located on the Tomago Sandbeds and PFAS migration in groundwater appears to occur principally within that aquifer. Further migration of the PFAS plume appears to be restricted by the north-westerly groundwater flow of the Stockton Sandbeds and by the presence of the confining effects of the Tilligerry Mud Member. While groundwater beneath the base and surrounds is considered to be a largely continuous, unconfined aquifer, the hydrogeological conceptual model considers the following depth intervals to evaluate the vertical distribution of PFAS: - Shallow groundwater screened primarily between 4-6 metres below ground surface (m bgs). - Intermediate groundwater screened between 10-14 m bgs. - Deep groundwater greater than 16 m bgs.
Vegetation	The base is bounded by the Tilligerry State Conservation area to the northwest and east. The base and immediate surrounding areas host a mix of remnant and dense native vegetation with some non-native species which extends some 15 km to the east of the base and some 13 km to the west. The heavily vegetated areas that surround the base to the north, east and west are crossed by tracks, roads, transmission lines and other linear infrastructure. The base is part of a broader low-lying marsh ecosystem and is often inundated, particularly to the north of the base which is naturally lower lying. The Hunter, Central & Lower North Coast Vegetation Classification & Mapping Project Volume 1: Vegetation Classification technical report, report prepared by HCCREMS (2009) notes the following plant community type (PCT)/vegetation groups on-base and in surrounding areas:

Element	Description
	- PCT 1707: Banksia oblongifolia – Hakea teretifolia – Leptocarpus tenax – Lepyrodia scariosa wet heath on sandstone ranges of the Central Coast. - PCT 1647: Red Bloodwood – Smooth-barked Apple heathy woodland on coastal sands of the Central and lower North Coast. - PCT 1651: Parramatta red gum – Fern-leaved banksia – Melaleuca sieberi swamp woodland of the Tomaree Peninsula. - PCT 1721: Swamp Mahogany – Broad-leaved Paperbark – Saw Sedge – Yellow Marsh Flower swamp forest of coastal lowlands. - PCT 1650: Parramatta Red Gum – Rough-barked Apple – Swamp Mahogany – Paperbarks swamp forest on lowlands of the Central Coast. The condition of remnant vegetation on-base (and surrounds) appears to primarily be good with little disturbance. Some areas of regeneration are evident on-base.
Current and Previous Land Use (on-base)	The base has been an active Defence base since 1941 and serves as the headquarters to both the Air Combat Group and the Surveillance and Response Group. In 2014, it was designated as the home base for Australia's F-35 Joint Strike Fighters. Activities undertaken on-base include training of Defence personnel in fire-fighting techniques, for which fire-fighting foams are used. PFAS were an active ingredient in legacy aqueous film forming foam (AFFF) used at the base since the early 1970s, which were phased out in 2004. Defence transitioned to Ansulite foam, which does not contain Perfluorooctanesulfonic Acid (PFOS) and Perfluorooctanoic Acid (PFOA) as an active ingredient, only in trace amounts. Ansulite is only used by Defence in emergency situations where human life is at risk, or in controlled environments to test equipment.
Current and Previous Land Use (off-base)	Off-base land uses comprise rural and semi-rural settlements at Fullerton Cove and Salt Ash, small commercial properties and the Salt Ash Primary School. Tilligerry State Conservation area, managed by National Parks and Wildlife Service and occupying approximately 7.6 km², immediately borders the base to the west, north and east. Hunter Water Corporation (HWC) pumping stations and groundwater extraction bore fields are located to the west, north and east of the base.

2.2 Management Area

The boundary of the initial Investigation Area was defined by the NSW Government in late 2015. Following the publication of the Environmental Site Assessment report in December 2017, the NSW Government replaced the Investigation Area with the Williamstown Management Area as described below.

The Management Area comprises three zones described below and illustrated on the NSW Government map presented in **Appendix D**. The NSW EPA has defined the zones as follows:

- Primary Management Zone** – this area has significantly higher levels of PFAS detected and directly receives PFAS-contaminated water migrating from the base. Therefore, the strongest precautionary advice applies.
- Secondary Management Zone** – this area has some detected levels of PFAS.
- Broader Management Zone** – the topography and hydrology of the area means PFAS detections could occur now and into the future.

The NSW Government noted that each zone has tailored precautionary advice for residents to minimise exposure to PFAS originating from the base.

2.3 PFAS source areas and distribution

PFAS source areas can be primary or secondary. Primary sources are generally areas of PFAS contamination where AFFF was used or stored, for example a fire training area. Secondary sources are areas where PFAS accumulates and then continues to feed into the environment, such as Lake Cochran. PFAS can travel from a source to human or environmental receptors via surface water and/or groundwater. These are referred to as “migration pathways”.

The PMAP (Defence, 2023b) provides a list of the PFAS sources, and the migration pathways based on the natural catchments across the base and Management Area (**Figure F1 in Appendix A**), as follows:

- Western Region – characterised by the Former Fire Training Area (FFTA) source that is now remediated, and a PFAS groundwater plume extending south away from the source through the former Demolition of Explosive Munitions Site (DEMS) landfill. A substantial proportion of the western plume is still on-base. PFAS from the western plume is inferred to discharge to Dawsons Drain south of the base.
- Central Region – characterised by PFAS sources at the:
 - Former and Current Fire Station area, including the Former Fire Training Pad (FTP); Foam Testing Facility (FTF); and Current Fire Station (Facility 165), located centrally within the base
 - the Sewage Treatment Plant (Facility 410), located south of the base adjacent to Newcastle Airport
 - Lake Cochran, stormwater retention pond that receives surface water runoff from central portions of the base including the Former and Current Fire Station area.

PFAS groundwater plumes from these sources extend south across the southern base boundary. The concentrations of PFAS south of the base and north of Cabbage Tree Road were likely sourced from Lake Cochran, which was impacted when AFFF containing high concentrations of PFAS were still in use at the base. However, Lake Cochran is no longer considered a significant ongoing PFAS source to groundwater. PFAS in the central southern plume primarily discharges into Leary's and Dawsons Drain.

- Eastern Region – characterised by likely sources at the Trade Waste Treatment Plant (Facility 480) and the Former Fuelling Area. The PFAS impacts in the Eastern Region are primarily due to groundwater entering the drainage network and discharging to Moors Drain, which flows to Tilligerry Creek. Given that the primary pathway east of the base is via Moors Drain and groundwater flow is to the south, the groundwater plume to the east of the base is not as developed as the western and central plumes.

The dominant regional groundwater flow direction at the base is to the south and southwest, with groundwater in the Tomago Sand Beds aquifer flowing towards Fullerton Cove in the western portion of the base, while also flowing in a south easterly direction in the eastern portion of the base. Further south, groundwater from the Stockton Sand Beds aquifer flows in a north westerly direction towards Tilligerry Creek. The PFAS plumes originating from the multiple primary sources in the Western and Central Regions are merging and moving southward.

PFAS is also present in groundwater to the east of the base, including at Salt Ash, inferred to be related to PFAS in surface water migrating along the drain network (Moors Drain and associated tributaries) before infiltrating to groundwater.

2.3.1 Groundwater impact

The groundwater flow patterns broadly reflect the regional drainage. Groundwater levels below sea level in the area are likely to reflect groundwater depressurisation caused by the deeper drainage features such as the Fourteen Foot Drain and Ten Foot Drain.

The lateral hydraulic gradient at and surrounding the base ranges from about 0.001 metres per metre (m/m) to about 0.0025 m/m (AECOM, 2017a). The gradient is indicated to be slightly steeper on-base

(0.0025 m/m) and flattens out towards a natural depression running in a southwest to northeast direction, south and east of the base (0.001 m/m).

The direction of the vertical hydraulic gradient varies across the base area. This may be due to the degree of interaction with surface water, with gaining surface water bodies associated with upward gradients and losing surface water bodies associated with downward gradients. Seasonal groundwater level fluctuations have been noted historically.

The two main primary sources of PFAS in surface water and groundwater at the base are the FFTA (within the Western Region); and the former FTP (within the Central Region).

Historical releases during training at the FFTA have resulted in a groundwater plume extending south from the FFTA. PFAS-impacted groundwater likely upwells into Dawsons Drain.

Remediation measures undertaken at the FFTA (including soil excavation and installation of a groundwater extraction and treatment system) have resulted in detachment of the plume from the source, however, the detached plume is still migrating towards the southern base boundary. In January 2026, Defence commenced extracting groundwater along the southern boundary of the base to target this plume (refer to **Section 6.1**) as per the PMAP (Defence, 2023b).

Historical releases at the FTP are likely to be the source of the PFAS impacts to surface water in the Central Region (surface drains on-base, water in Lake Cochran, and Dawsons Drain) as well as the groundwater plume extending more than 500 m off-base to the south. The Central Region plume (southern plume) discharges to the surface in Leary's Drain which eventually discharges to Fullerton Cove.

It is also likely that the FTP is a potential contributing source for both the groundwater plume in the Eastern Region, and discharges of PFAS in surface water to Moors Drain.

The discharge of PFAS in groundwater across the base boundary in the Eastern Region has been estimated to be relatively minor (less than 1% of total PFAS discharge in groundwater leaving the base). In accordance with the PMAP (Defence, 2023b) Defence is currently undertaking characterisation of PFAS impacts in surface water and groundwater within the Eastern Region to refine understanding of PFAS source areas and migration mechanisms.

2.3.2 Surface water impact

The base is located within estuarine and coastal wetlands that have been reclaimed via a network of drains constructed to convert low lying swampy land into dry land for improved land use. These drains have provided pathways for the migration of PFAS and substantially influenced its current distribution.

The following two key drains collect surface and drainage water from the base and discharge towards the topographic depression running southwest to northeast beyond the southeastern base boundary (refer to **Figure F3** in **Appendix A**):

- Dawsons Drain:
 - Drains the western portion of the base towards the south in direction of Fullerton Cove (a shallow embayment of the nearby Hunter River). Dawsons Drain receives a significant amount of runoff from parts of the base with multiple known PFAS source areas. Much (but not all) of this water accumulates in Lake Cochran before overflowing to Dawsons Drain.
 - Lake Cochran is a man-made stormwater retention basin that, owing to its depth, intersects shallow groundwater in the southern area of the base. Modelling has supported the assumption that Lake Cochran has historically contributed PFAS-impacted surface water to groundwater.
 - Dawsons Drain flows south from Lake Cochran, passes under Cabbage Tree Road, and discharges into the Fullerton Cove Ring Drain, which discharges to Fullerton Cove via tidal gates. South of the base, Dawsons Drain likely receives upwelling groundwater containing PFAS from the western and central plumes. Dawsons Drain is unlined and provides a connection between surface water and shallow groundwater.

- Moors Drain:
 - Drains the eastern portion of the base via three channels which form two principal branches (Northern Branch and Southern Branch), and merge approximately 1 km east of the base. This drain flows for approximately 7 km northeast to discharge via tidal floodgates into the Tilligerry Creek Estuary, which forms part of Port Stephens. Moors Drain receives runoff from the eastern part of the base and is a losing drain (i.e., drain water infiltrates to groundwater) along much of its length. It appears to contribute to secondary PFAS groundwater impacts to the northeast of the base towards Salt Ash and then to Tilligerry Creek Estuary.
 - It is understood that water flow from the base drainage network into Moors Drain only ceases following a prolonged dry period when groundwater levels drop due to limited infiltration and recharge. Moors Drain is unlined and provides a direct pathway to the shallow groundwater.

3.0 Sampling plan and deviations

3.1 Locations, events, analysis

The SAQP outlines the proposed locations to be sampled, schedule, sampling rationale, sampling methodology for each of the media and the required analysis as per the requirements of the OMP (Defence, 2023a). It prescribes biannual (every six-months) groundwater, surface water and sediment sampling at the base and Management Area, and biennial (every second year) aquatic biota sampling in Fullerton Cove. For this monitoring period, in addition to the biannual sampling, the SAQP prescribed sampling of a number of groundwater locations on an Ad Hoc frequency, which was then reviewed after each sampling event. The biota sampling was not in scope for this monitoring period, however, will be carried out during the next (2026) monitoring period.

The sampling events were timed to target different rainfall periods, based on historical rainfall data recorded at the BoM weather station (061078) located at the base. In general, historical rainfall data indicates the greatest rainfall occurs in late summer and autumn with the least rainfall occurring in winter and spring. In part, this trend was observed during the monitoring period with rainfall significantly above the historical average observed in April 2025 and especially in May 2025 (more than 4 times the long-term average) (refer to **Section 6.4**). However, significantly higher than average rainfall total was recorded also in winter, with July and August 2025 experiencing totals of 2 to 3.5 times the long-term average.

A summary of the two OMP sampling events completed during the monitoring period is provided in **Table 2** below. The list of locations that were planned to be sampled over the monitoring period are presented in **Section 7.1.1** in **Table 8**.

Some locations could not be sampled due to impediments encountered during the sampling events or other reasons, which are described in **Section 3.2**.

A number of groundwater sampling locations, where historical PFOS concentrations were consistently reported below or close to the laboratory limit of reporting (LOR), were selected to be analysed for PFAS at low level laboratory LOR, to allow for assessment against the current Australian Drinking Water Guidelines (which were in draft at the time of preparing the SAQP for the April 2025 event).

Table 2 Summary of monitoring events

Monitoring Event (Sampling dates) <i>Relevant SAQP</i>	Total Locations in Scope as per SAQP	Total Locations Sampled in Event	PFAS Analysis Limit of Reporting (LOR) per Location as per SAQP
April 2025 Annual sampling event (1-17 April 2025, 26-27 May 2025, 10 June 2025) <i>SAQP Rev B: AECOM, 2025a</i>	136 GW + 4 GW Ad Hoc + 10 GW Contingency	127 GW + 2 GW Ad Hoc + 10 GW Contingency	80 GW at Standard LOR 70 GW at Low Level LOR
	25 SW	25 SW	25 SW at Standard LOR
	26 SD	26 SD	26 SD at Standard LOR
October 2025 Biannual sampling event (7-20 October 2025) <i>SAQP Rev D: AECOM, 2025d</i>	74 GW + 12 GW Ad Hoc	61 GW + 10 GW Ad Hoc	37 GW at Standard LOR 49 GW at Low Level LOR
	25 SW	24 SW	25 SW at Standard LOR
	26 SD	25 SD	26 SD at Standard LOR

Notes: GW = groundwater, SW = surface water, SD = sediment.

The SAQP is routinely updated prior to each sampling event based on findings from the preceding sampling event. SAQP revisions used throughout the monitoring period are listed in **Table 2**. The SAQP (AECOM, 2025d) prepared ahead of the October 2025 biannual sampling event has been included in **Appendix G**.

3.2 Deviation from the SAQP

Deviations from the scope outlined in SAQP for the monitoring period are summarised in **Table 3** below.

Table 3 Deviations from SAQP during the monitoring period

SAQP Requirement	Sampling Event Deviation	Impact of deviation on dataset
Annual Sampling Event – April 2025		
Samples, and associated field parameters, to be collected from 136 scheduled annual groundwater sampling locations.	MW238D, MW238S, POT085 and POT236 (groundwater sampling locations at private residential properties) were not sampled as access approval from property owners was not received within the sampling period. MW252S (located on Hunter Water land) was not sampled due to flood water covering the monitoring well. The location was visited on separate occasions during the sampling event; however, the flood water had not subsided. MW104D, MW104S, MW184D, and MW184S (located at Newcastle Airport) were not sampled as they were destroyed by construction works.	The lack of sampling data at MW238D and MW238S is not considered to present a significant data gap, as a nearby monitoring well (MW139 to the southwest) was able to be sampled. The lack of sampling data at POT085 and POT236 could represent a data gap, given these locations have not been sampled since 2023. However, it is noted that historical data at these locations show stable PFAS concentrations since 2016, either consistently below the laboratory LOR (POT085) or consistently above the adopted drinking water guidelines (POT236). The lack of sampling data at MW252S is considered a potential data gap as there is limited coverage in this area to the east of the base. However, it is noted that historical data at this location shows PFAS concentrations decreasing from 2017, while still consistently above the adopted drinking water guidelines for PFOS and Perfluorohexanesulfonic Acid (PFHxS). The lack of sampling data at MW104D, MW104S, MW184D, and MW184S is considered a potential data gap as there is limited coverage to the south of the base. However, it is noted that historical data at these locations show PFAS concentrations being stable (for MW104S) or decreasing (for MW104D, MW184S, MW184D) from 2017, and consistently above the adopted drinking water and recreational guidelines.
Field parameters and gauging data to be collected from all scheduled groundwater sampling locations (monitoring wells).	MW406 was sampled however due to an equipment error, the field parameters and gauging data taken at the time of sampling were lost.	The lack of gauging data and water quality parameters at MW406 is not considered to be a significant data gap given that historical field data has been collected and samples for PFAS analysis were collected.
Gauging data to be collected from 29 selected monitoring wells for the	MW162D was unable to be gauged as the gatic lugs and j-cap were jammed. However, the location was revisited and	The lack of gauging data during the gauging round at MW162D is not considered to be a significant data gap, as the other wells were able to be gauged allowing sufficient coverage for the groundwater elevation plan.

SAQP Requirement	Sampling Event Deviation	Impact of deviation on dataset
targeted gauging round.	repaired, enabling gauging and sampling.	
Samples, and associated field parameters, to be collected from 14 planned ad hoc and contingency groundwater sampling locations.	MW266D (groundwater monitoring well located on residential property) was not sampled as the gatic bolts were rusted and the well could not be accessed. MW165 (groundwater monitoring well on the road verge) was not sampled as the well could not be located due to overgrown grass.	The lack of sampling data at MW165 is considered to be a potential data gap given the location provides coverage for the boundary of the Broader Management Zone to the east of the base. It is noted that historical data at this location (from 2016 to 2019), show PFAS concentrations below the standard laboratory LOR. The lack of sampling data at MW266D is not considered a significant data gap given the nearby shallow well (MW266S) was able to be sampled.
All groundwater results to be screened against the drinking water criteria presented in the PFAS NEMP (HEPA, 2025).	In June 2025, the National Health and Medical Research Council (NHMRC) released updated drinking water guidelines for PFOS, PFHxS, PFOA and PFBS. As a result, AECOM adopted these revised drinking water criteria for this sampling event, superseding the drinking water criteria (HEPA, 2025) presented in the SAQP (AECOM, 2025a) and in the OMP (Defence, 2023a).	The revised drinking water screening criteria for PFOS is 0.008 µg/L, which is below the standard laboratory LOR (0.02 µg/L). In anticipation of the release of the updated NHMRC guidelines following the April 2025 event, AECOM scheduled selected samples (from locations where concentrations were historically either below the laboratory LOR or below the former drinking water screening criteria) for low level PFAS analysis. A number of groundwater samples were also scheduled for standard laboratory LOR analysis as per the SAQP (AECOM, 2025). For these locations (MW108D, MW134D, MW134I, MW240D, MW245D, MW317D, MW340S, and MW406), the LOR for PFOS was above the updated ADGW (NHMRC, 2025). Therefore, samples with concentrations reported below the standard laboratory LOR were unable to be compared to the updated drinking water criteria.
Biannual Sampling Event – October 2025		
Samples, and associated field parameters, to be collected from 74 scheduled biannual groundwater sampling locations.	MW238D, MW238S, POT085 and POT236 (groundwater sampling locations at private residential properties) were not sampled as access approval from property owners were not received within the sampling period. MW107D, MW107S, MW130D, MW130S, MW252S, MW280S, MW315D, MW315S (located on Hunter Water land) were not sampled due to flood water covering the monitoring wells. The locations were	The lack of sampling data at MW238D and MW238S is not considered to present a significant data gap given that PFAS has not previously been detected in these wells, and as nearby monitoring wells (MW139 to the west southwest and MW178 to the southeast) were able to be sampled during this event. The lack of sampling data at POT085 is not considered to be a significant data gap as concentrations at this location have been consistently below the laboratory LOR since 2019, and the concentrations in the closest up-hydraulic gradient monitoring well (MW139) were below the laboratory LOR

SAQP Requirement	Sampling Event Deviation	Impact of deviation on dataset
	visited on separate occasions during the sampling event; however, the flood water had not subsided. MW185S (located at Newcastle Airport) was not sampled as it was covered by a stockpile.	during this event (consistent with previous results). POT236 has not been sampled since May 2023. Based on the understanding of the CSM, data from POT236 is not critical for monitoring the extent of the leading edge of the plume from the Central Region and is therefore not considered to be a significant data gap. The lack of sampling data at MW107D, MW107S, MW238D, MW238S, MW280S, MW315D and MW315S in the Western Region are not considered to present a significant data gap as monitoring wells MW139, MW241D and MW241S (cross gradient) and MW177, MW125D and MW125S (down gradient) were able to be sampled during the October 2025 event and all reported PFAS concentrations were within the historical range. The lack of sampling data at MW185S in the Central Region is not considered to be a significant data gap given that down-hydraulic gradient well MW220S (also on airport land) was able to be sampled with concentrations of PFAS reported within the historical range. The lack of sampling data at MW130D and MW130S in the Eastern Region are not considered to be a significant data gap as nearby, down-hydraulic gradient wells MW829, MW132I and MW132D were able to be sampled during the October 2025 event and PFAS concentrations were reported within the historical range at these locations. The lack of sampling data at MW252S in the Eastern Region is not considered a significant data gap as nearby monitoring well MW123 was able to be sampled during the October 2025 event and reported concentrations of PFAS within the historical range.
Samples, and associated field parameters, to be collected from 12 planned ad hoc groundwater sampling locations.	MW266D (groundwater monitoring well located on residential property) was not sampled as the gatic bolts were rusted and the well could not be accessed. Note that MW266D had been added to the scope as an ad hoc	The lack of sampling data at MW266D is not considered to be a significant data gap given that the purpose of sampling of these 12 ad hoc locations was to assess the extent of the groundwater plume due to concentrations below the updated NHMRC (2025) drinking water guidelines. Given that concentrations of PFOS and PFHxS have historically been above the updated guidelines at MW266D, it is likely that the concentrations would

SAQP Requirement	Sampling Event Deviation	Impact of deviation on dataset
	location and had not been sampled since 2021. MW165 (groundwater monitoring well on the road verge) was not sampled as the well could not be located due to overgrown grass. Note that MW165 had been added to the scope as an ad hoc location and had not been sampled since 2019.	continue to exceed the guidelines at this location. The lack of sampling data at MW165 is not considered to be a significant data gap as this is an ad hoc location and nearby monitoring wells (MW260D and MW260S to the west and MW262S to the northeast) were able to be sampled during the current round.
Samples, and associated field parameters, to be collected from 25 planned surface water sampling locations.	SW011 (Moors Drain surface water sampling location on Hunter Water land) was not sampled as the sampling location was unable to be accessed due to floodwaters. The locations were visited on separate occasions during the sampling event; however, the flood water had not subsided. SW001 was sampled, however due to an equipment error, the dissolved oxygen field parameter data taken at the time of sampling was lost.	The lack of sampling data at SW011 is not considered to present a significant data gap given that samples were collected upstream (SW009) and downstream (SW014) of this location during this event. Furthermore, it is noted that historical PFAS concentrations at this location have remained consistent (within same order of magnitude) since 2016, with temporal fluctuations. The lack of dissolved oxygen parameter data is not considered to be a significant data gap, given that historical field data has been collected.
Samples, and associated field observations, to be collected from 26 planned sediment sampling locations.	SD011 (sediment sampling location on Hunter Water land) was not sampled as the sampling location was unable to be accessed due to floodwaters. The locations were visited on separate occasions during the sampling event; however, the flood water had not subsided.	The lack of sampling data at SD011 is not considered to represent a significant data gap given that samples were collected upstream (SD009) and downstream (SD014) of this location during this event. Furthermore, it is noted that historical PFAS concentrations have remained consistent (within same order of magnitude) since 2016, with temporal fluctuations.

4.0 Quality Assurance and Quality Control

Data validation pertaining to the data in this report has been previously completed and discussed within the individual Sampling Event reports listed in **Section 1.2**.

Data validation procedures employed in the assessment of the field and laboratory Quality Assurance and Quality Control data, completed as per Section 3.2 of the SAQP (AECOM, 2025d), indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable (i.e. >95% of the data was suitable for use and DQIs passed acceptance criteria) for the purpose of the sampling event reports and this OMR.

All data collected during the monitoring period had been reviewed and uploaded to the Defence ESdat database in accordance with the Defence Contamination Management Manual (DCMM) requirements.

5.0 Assessment criteria

The adopted assessment (screening) criteria references national guidance in the form of PFAS National Environmental Management Plan (NEMP) (Heads of Environment Protection Authority Australia and New Zealand [HEPA], 2025), Defence estate and environmental strategies, and other PFAS-specific strategies and guidance. At the time of preparing this report, a number of national guidance documents were available in Australia and referred to, including:

- HEPA, 2025. PFAS NEMP Version 3.0. March 2025.
- Australian and New Zealand Governments (ANZG), 2026. Australian and New Zealand guidelines for fresh and marine water quality. Retrieved from <https://www.waterquality.gov.au/anz-guidelines> March 2026.
- Department of Health (DoH), 2017. Health Based Guidance Values for PFAS for use in site investigations in Australia. April 2017. This document is based on the works undertaken by Food Standards Australia New Zealand (FSANZ) in 2017 (FSANZ, 2017).
- National Health and Medical Research Council (NHMRC), 2019. Guidance on Per and Polyfluoroalkyl Substances (PFAS) in Recreational Water. August 2019.
- NHMRC, 2025. Australian Drinking Water Guidelines 6, 2011 - National Water Quality Management Strategy. Version 4.0 Updated June 2025.

The adopted PFAS screening criteria to assess the data collected as part of this monitoring period are presented in **Table 4** (human health criteria) and **Table 5** (ecological criteria), in line with the updated OMP (Defence, 2026).

It is noted that for the purpose of presenting data within this report, AECOM has focused on Perfluorooctanoic acid (PFOA), Perfluorooctanesulfonic acid (PFOS) Perfluorohexanesulfonic acid (PFHxS), PFOS+PFHxS and Perfluorobutanesulfonic acid (PFBS) i.e., those PFAS for which there are either human health and/or ecological screening criteria.

At the time this report was prepared no assessment criteria were available in Australia for PFAS in sediments. This does not reflect a lack of concern about the significance of this pathway, but rather an acknowledgment of its complexity and the limitations of the ecotoxicological data that are currently available. This issue will be reviewed in subsequent reports. Additionally, the adopted PFAS screening criteria for aquatic biota have been omitted given that no biota sampling has been conducted in this monitoring period

Table 4 PFAS water criteria summary: Human health

Media	Pathway	Compound	Criteria	Comment/reference
Water – Groundwater	Drinking water	PFOS	0.008 µg/L	In June 2025, the NHMRC (2025) published revised drinking water criteria guidelines for PFOS, PFHxS, PFOA and PFBS. <i>All off-base groundwater results were screened against these criteria.</i>
		PFHxS	0.03 µg/L	
		PFOA	0.2 µg/L	
		PFBS	1 µg/L	
Water – Groundwater and Surface Water	Recreational use	PFOS+PFHxS	2 µg/L	The values presented in the PFAS NEMP (HEPA, 2025) are based on the NHMRC (2019) values. Given that groundwater at the base is extracted for irrigation purposes (post treatment), the recreational guidelines have been adopted to be protective of this water use activity. <i>All surface water and groundwater results were screened against these criteria.</i>
		PFOA	10 µg/L	

Table 5 PFAS water criteria summary: Ecological

Media	Pathway	Chemical	Criteria	Comment/reference
Water – Groundwater and Surface Water	Freshwater	PFOS	0.02 µg/L	The PFOS value is from the ANZG (2026). The PFOA value is from the PFAS NEMP (HEPA, 2025). ANZG (2026) recommends a conservative approach when applying default guideline values (DGVs) for bioaccumulative toxicants. As such the 99% species protection DGV has been selected for application to the slightly-to moderately-disturbed freshwater ecosystem. <i>All groundwater and surface water samples were screened against these criteria. Assessment of these criteria against groundwater results are relevant at the point of discharge.</i>
		PFOA	19 µg/L	

6.0 Contextual and ancillary information

6.1 PFAS remediation projects

The two main primary sources of PFAS in surface water and groundwater at the base are the FFTA (Western Region) and Facility 165 (Central Region). Releases during historical fire training activities at the FFTA have resulted in a groundwater plume extending south from the FFTA with the toe of the plume approximately 150 m south of the base boundary which likely upwells into Dawsons Drain.

Historical releases at Facility 165 are likely to be the source of the PFAS impacts to surface water in the Central Region (surface drains on base, water in Lake Cochran, and Dawsons Drain) as well as the groundwater plume extending from the Facility 165 to the area of Cabbage Tree Road, off-base to the south. It is also likely that the Facility 165 is a potential contributing source for the groundwater plume in the Eastern Region, as well as surface water PFAS discharges to Moors Drain.

Defence has implemented multiple remedial actions that were identified in the 2019 PMAP (Defence 2019), and subsequent updated 2023 PMAP (Defence 2023a), to manage potential PFAS exposure risks and progressively reduce PFAS migration from the base in surface water and groundwater.

The remedial actions completed at the FFTA (including soil excavation and installation of a pump and treat system) have resulted in detachment of the plume from the source (indicating effectiveness of the remedial actions for source containment); however, the detached plume is still migrating towards the southern Base boundary, ultimately discharging towards Fullerton Cove.

PFAS remediation projects conducted within the monitoring period consisted of groundwater extraction and treatment at two on-base water treatment plants and surface water treatment at one location. A summary of the three water treatment plants' (WTP) performance up to November 2025 is provided below in **Table 6**.

Table 6 Water Treatment Plant performance summary

Item	MD WTP	FFTA WTP ¹	SA WTP
Treatment commencement	June 2017	July 2018	May 2019
Volume treated since commencement (as of 11 November 2025)	1,082 ML	2,342 ML	1,373 ML*
Average total PFAS concentrations prior to treatment (since commencement) in µg/L (as of 11 November 2025)	3.91	16.92	12.41*
Average PFOS+PFHxS concentrations prior to treatment (since commencement) in µg/L (as of 11 November 2025)	3.42	15.65	11.07*
Average PFOS+PFHxS treated water concentration (since commencement) in µg/L (as of 11 November 2025)	< 0.01	< 0.01	< 0.01*
Approx. total PFAS removed since commencement (as of 11 November 2025)	3.71 kg	37.04 kg	17.06 kg*
PFAS removed in this monitoring period	0.31 kg	2.24 kg	1.55 kg*

Note:

¹ The FFTA WTP ceased operation on 14 November 2025 and upgraded to treat groundwater from the Western Region wellfield.

* Data for SA WTP is up to 24 September 2025, as WTP was offline pending upgrade / recommissioning.

Overall, approximately 4.1 kg of PFAS was removed from the environment (groundwater and surface water) via the three WTPs during this monitoring period. Further detail on each WTP is provided in the following sections.

6.1.1 FFTA Water Treatment Plant project

Defence continued the extraction and treatment of PFAS-impacted groundwater around the FFTA by a pump and treat system using ionic exchange resin treatment technology. Treated water is disposed by on-base irrigation.

The annual average PFAS concentration treated by the FFTA WTP is provided in **Figure 1** and the PFAS mass removed annually by the FFTA WTP is provided in **Figure 2**. The concentrations are those measured at the inlet of the water treatment plant. **Figure 1** shows that the average influent PFAS concentration in 2024-2025 was less than half of that when the plant commenced its operation in 2018. Defence implemented changes to the pumping regime following recommendations outlined in the Remediation Options Assessment (ROA) (Geosyntec, 2022)

As evident on **Figure 1** and **Figure 2**, pumping from the source area resulted in diminishing returns, with the PFAS mass removed reduced from around 8.5 kg between 2018 and 2019 to about 2.72 kg between 2024 and 2025.

The FFTA WTP ceased operation on 14 November 2025. The plant was upgraded to extract groundwater from the core of the FFTA plume via a new extraction wellfield (known as the Western Region wellfield) at the southern boundary of the base. This involved the movement of the extraction system of the FFTA WTP to the southern boundary. This change was made in response to the migration of the centre of mass of the plume beyond the capture zone of the current extraction system, as evidenced by the reduction in treatment concentrations and PFAS mass from the current extraction area.

It is noted that moving the pumping line to the southern boundary is also intended to capture the material that has historically migrated beyond the source area. The net reduction in PFAS discharge annually is anticipated to be in the order of 5 kg per annum. The commissioning of the new Western Region extraction wellfield occurred on 27 January 2026.

Figure 1 Annual average PFAS concentration treated by FFTA WTP

Figure 2 Annual PFAS mass removed by FFTA WTP

6.1.2 Southern Area (SA) WTP project

Defence continued the extraction of groundwater from the Southern Area (area immediately south of Lake Cochran, within the base) using ionic exchange resin treatment technology. Treated water is disposed via irrigation on the base. The WTP was offline from October 2025 to January 2026 for upgrade / re-commissioning.

The annual average PFAS concentration treated by the SA WTP is provided in **Figure 3** and the PFAS mass removed annually by the SA WTP is provided in **Figure 4**. PFAS concentrations are measured at the inlet of the water treatment plant.

The influent PFAS concentrations have decreased since WTP commencement in 2019, with about 30% decrease in 2024-2025 concentrations when compared to 2019-2020, as shown on **Figure 3**.

The annual PFAS mass removal has reduced from around 4.8 kg between 2019 and 2020 to about 2 kg between 2024 and 2025 as shown on **Figure 4**. Both concentrations and mass removal rates now appear to have plateaued. The decrease in PFAS concentrations and PFAS mass removal values are supported by groundwater modelling that indicated the majority of the central plume PFAS mass has migrated south beyond the extraction wellfield, which had occurred prior to the commencement of remedial works (in 2019).

Defence is currently designing and planning for an off-base groundwater extraction wellfield (and associated pipeline) between the southern base boundary and Cabbage Tree Road. The new extraction wellfield would allow treatment of off-base portions of the central plume and would result in the cessation of groundwater extraction from the current extraction wellfield located south of Lake Cochran.

Defence is also planning to trial an in-ground permeable reactive barrier to treat groundwater along the southern boundary of Lake Cochran, upgradient of the current extraction wellfield, to continue remediation of remaining PFAS mass in this area. The investigations, including the installation of groundwater monitoring wells and bench scale trial have commenced.

Figure 3 Annual average PFAS concentration treated by SA WTP

Figure 4 Annual PFAS mass removed by SA WTP

6.1.3 Moors Drain WTP project

Defence continued the treatment of PFAS-impacted stormwater discharging under Medowie Road to the northern branch of Moors Drain, via the Moors Drain WTP (MD WTP). The MD WTP extracts water from a stormwater pit which receives flow from stormwater pipes draining the northern areas of the base. Stormwater is treated using ionic exchange resin technology and treated water is discharged back to Moors Drain approximately 3 m downstream from the stormwater pit extraction point.

Defence is undertaking further characterisation of PFAS impacts and PFAS migration mechanisms in the Eastern Region catchment (i.e. on-base Moors Drain catchment) to optimise MD WTP performance and inform other PFAS management strategies (potentially targeting source areas). A summary of these investigations is outlined in **Section 6.2**.

The annual average PFAS concentration in influent received at MD WTP is shown on **Figure 5**. Given that the WTP influent is derived from stormwater influent, PFAS concentrations may potentially be diluted in the short term by significant rainfall events (refer to **Table 7**). However influent concentrations have decreased steadily from approximately 5.7 µg/L in 2017-2018 to approximately 2.16 µg/L in 2024-2025, independent of short-term rainfall impact.

The annual mass of PFAS removed by the WTP has varied over time, peaking between 2019 and 2021, when the treatment capacity was increased. The PFAS mass removed has reduced from around 0.7 kg between 2020 and 2021 to about 0.3 kg between 2024 and 2025, as shown on **Figure 6**.

Figure 5 Annual average PFAS concentration treated by MD WTP

Figure 6 Annual PFAS mass removed by MD WTP

6.2 PFAS characterisation projects

Data from the following current PFAS characterisation projects have been included in the dataset referenced by this OMR. Where applicable, the data from these projects have been used to update the understanding of the CSM and evaluate changes in the characteristics of the PFAS plume.

The locations of the PFAS characterisation projects discussed in **Section 6.2.1** to **Section 6.2.5** are presented below on **Figure 7**.

Figure 7 PFAS Characterisation Project Locations

6.2.1 Dawsons Drain catchment study

During the 2025 monitoring period, AECOM commenced the Dawsons Drain catchment study comprising:

- Sampling of inflow and outflow locations at Lake Cochran daily for one week, then weekly for four weeks. The sampling took place in April and May 2026 and covered periods of moderate to high water levels within the lake
- Base flow sampling along Dawsons Drain when the flow rate and water table was very low (March 2025), and then again when the flow rate was moderate and the water table was high (May 2025).

While the investigation was ongoing at the time this report was prepared, the preliminary findings suggests that surface water from Lake Cochran is not a significant contributor to the overall mass of PFAS present within Dawsons Drain.

6.2.2 Western Region well installation and monitoring

In June 2025, AECOM installed and developed five new groundwater monitoring wells to the south of the new extraction wellfield in the Western Region to target the extent of the capture zone of the planned extraction system based on model outcomes. The monitoring program commenced at the time of the commissioning of the new Western Region wellfield in January 2026.

In addition to the above works, AECOM completed the monitoring of the FFTA wellfield between November 2025 and February 2026 to characterise changes in PFAS concentrations in groundwater following the switching off the existing FFTA groundwater extraction system and assess whether groundwater PFAS concentration rebound occurs.

At the time this OMR was prepared, this investigation was ongoing and is forecast to be completed in Q2 2026.

6.2.3 Eastern Region catchment study

AECOM completed three rainfall sampling events between June 2025 and August 2025, utilising seven autosamplers installed at targeted locations in the eastern catchment, including along the northern and southern tranches of Moors Drain. The purpose of these events was to collect PFAS mass discharge data to supplement the surface water baseline data collected by AECOM in 2024, to further refine the understanding of PFAS sources and transport mechanisms within the Eastern Region catchment.

The preliminary findings of this investigation suggest that the northern and eastern most sub-catchments within the Eastern Region were low priority for further investigations. This was due to distinctly lower PFAS mass discharge rates than other sub-catchments or being relatively small areas consisting primarily of car parks with no obvious potential sources. The surface water mass discharge rates were notably higher in Sub-catchment 2 (containing the MEOMS building), Sub-catchment 3 (containing the Former Fuel Farm) and Catchment F (which receives surface water discharge from Facility 165).

The findings from the study will inform future remedial planning in 2026.

6.2.4 Facility 165 investigation

AECOM completed a soil and groundwater investigation between November 2025 and December 2025, which comprised 41 shallow hand auger holes, 10 soil boreholes, 24 in-situ groundwater samples, 23 surface water samples and sampling 13 existing groundwater monitoring wells at, and in the vicinity of, the Facility 165 source area.

The purpose of the investigation was to characterise residual PFAS mass in soils at the Facility 165 source area, and to assess whether the residual PFAS impacts at this location are significant, ongoing contributors to PFAS migrating from the base in surface water into Dawsons Drain to the south, and Moors Drain to the east.

At the time this report was prepared, this investigation was ongoing and is forecast to be completed in Q2 2026. Once completed, the findings of the investigation will be used to inform future remediation options.

6.2.5 Permeable barrier trial investigation

The ROA (Geosyntec, 2022) noted that the ongoing PFAS discharge across the base boundary south of Lake Cochran is relatively small and groundwater crossing the boundary will eventually be captured in the Southern Area plume pump and treat system. Therefore, a passive carbon barrier system was identified as the preferred remedial option for this area.

In November 2025, AECOM commenced an investigation to determine site-specific isotherms and generate performance data to reduce uncertainties in the design of a permeable barrier system, . The works comprised the installation and sampling of 15 new groundwater monitoring wells along the southern bank of Lake Cochran, and the collection of bulk water and soil samples which were shipped to a specialist laboratory in the USA for a bench scale trial.

At the time this report was prepared, the investigations were ongoing.

6.2.6 Ad hoc sampling

AECOM completed ad hoc sampling (i.e. outside of the OMP) of properties within the Management Area during the monitoring period.

6.3 Infrastructure projects

6.3.1 National Airfield Works (P0008)

Infrastructure works associated with the National Airfield Works (project P0008) commenced in 2022 and continued through the monitoring period. These works involve the delivery of a major aircraft pavement, stormwater drainage and maintenance works. It is understood that the project requires soil management and dewatering as part of runway and stormwater drainage upgrade works.

A large material stockpile associated with the project was established adjacent the northern edge of Lake Cochran in 2022, with standard construction erosion and sediment controls in place. The stockpile is located adjacent to groundwater monitoring locations MW179S and MW179D, and surface water monitoring locations SW108 and SW110 within Lake Cochran. Note that PFAS concentrations in MW179S, MW179D, SW108 and SW110 were either within historical ranges or within an order of magnitude of historical ranges during the monitoring period (refer to Section 7.0 and Section 8.0), indicating that the potential for impact from the stockpiled material at these locations is low.

6.3.2 Greater Newcastle Aerotropolis

Land clearing and earthworks associated with the Greater Newcastle Aerotropolis development has continued beyond the southern base boundary south of Lake Cochran. These activities are however not expected to impact the results of the monitoring data or affect concentrations of PFAS in this part of the Management Area.

6.4 Significant weather events

During the monitoring period, the Hunter Region (as recorded at the BoM monitoring station located at RAAF Base Williamstown - Station ID 061078) experienced higher than average precipitation (1,722 mm, above the average of 998 mm). Rainfall was also significantly greater than the previous monitoring period (1,215 mm). The data for the monitoring period is presented in **Figure 8** against historical ranges on record since the weather station commenced operation in 1942.

Included in **Figure 8** is a 6-month Standardised Precipitation Index (SPI), which presents monthly rainfall against the average monthly rainfall as a value, where 1 is average rainfall, and where 2 is twice the average monthly rainfall. This allows for medium term assessment on the rainfall experienced by the area over the monitoring period.

Figure 8 Rainfall data from January 2025 to December 2025. Rainfall data from Williamtown RAAF monitoring station (station 061078) (BoM, 2026)

The rainfall activity during the sampling events over the monitoring period for the BoM monitoring station (Station ID 061078) and the occurrence of wet weather event (days with rainfall >15 mm) are summarised in **Table 7** below.

Table 7 Rainfall during monitoring period

Sampling event and dates	Recorded rainfall (mm) (BoM, 2025) for month	Wet weather events immediately prior or during the sampling period (days with rainfall >15 mm)
April 2025 Annual Sampling Event 31 March to 17 April 2025 (main event)	180 mm (April 2025, total)	29 March 2025 (37 mm) 30 March 2025 (34.2 mm)
October 2025 Biannual Sampling Event 7 October to 20 October 2025	30.8 mm (October 2025, total)	Nil

From the review it is noted that the area typically experienced above average rainfall in the first half of the monitoring period (i.e. late summer, autumn and winter) with one month in this period (May 2025) experiencing greater than four times the historical average rainfall.

Average groundwater elevations in shallow groundwater monitoring wells (1.48 m AHD) were on average 0.12 m higher than those reported during the 2024 monitoring period (1.36 m AHD), and on average 0.6 m higher than those reported during the 2023 monitoring period (0.88 m AHD). This indicates that the above average precipitation reported in the first half of the monitoring period resulted in increased groundwater recharge and higher groundwater elevations in the shallow groundwater zone during the 2025 monitoring period.

The higher-than-average rainfall experienced between January 2025 and September 2025 has the potential to impact upon the interpretation of the data, as follows:

- The increased volume of surface waters being present in the broader catchment has the potential to increase the distribution of PFAS compounds within the surface water bodies. PFAS concentrations may become diluted, report lower than historical concentrations and result in PFAS being detected at greater distances from the source.
- Potential to disperse PFAS to shallow soils via increased surface run off from source areas.
- Potential for increased mixing between shallow groundwater and surface water.
- Increase in groundwater elevation may result in longer contact with impacted soils.

However, it is acknowledged that the Management Area has been subject to multiple significant flood events historically, and PFAS concentrations in stormwater discharges from the base would have been higher when PFAS containing AFFF was regularly being used. As a result, it is unlikely that these flood events have significantly changed the lateral extent of PFAS impacts within the Management Area.

Recorded rainfall between September 2025 and December 2025 was generally below historical averages albeit with minor fluctuations above and below long-term monthly averages.

6.5 Off base activities

Whilst ongoing development associated with the Newcastle Airport precinct to the south of the base continued during the monitoring period, there were no changes in residential land use or water usage observed during field activities and /or reported in the off-base monitoring areas during the monitoring period.

7.0 Monitoring data summary

7.1 Overall summary

7.1.1 OMP data

As part of the OMP, the following two scheduled monitoring events were completed by AECOM over the monitoring period:

- Annual surface water, sediment and groundwater sampling undertaken in April 2025 (1 to 17 April 2025, with additional sampling undertaken on 26 to 27 May 2025 and on 10 June 2025) (AECOM, 2025c).
- Biannual surface water, sediment and groundwater sampling undertaken in October 2025 (7 to 20 October 2025) (AECOM, 2025e).

The sample locations, the management zones and surface water features are shown in **Appendix A**, on **Figures F2-1 to F2-4** for groundwater locations, **Figure F3** for surface water locations and **Figure F4** for sediment locations. **Figure F3** also includes key surface water pathways from the base.

Results from the monitoring period are summarised in the following sections for each matrix. The monitoring activities are summarised in the OMP Sampling Event Reports (AECOM, 2025c and AECOM, 2025e) provided in **Appendix H**. It is noted that the data has been presented and discussed in line with the updated OMP (Defence, 2026).

The locations and relevant data are discussed in general with reference to sources areas, management zones and/or other areas of interest, as shown in **Table 8** below.

Table 8 Location groupings

Management zone	Area	Locations
Groundwater		
On-base	Former & Current Fire Station (Facility 165)	MW196, MW198, MW200, MW201D, MW201S, MW202D, MW202S
	Former DEMS Landfill (Facility 394)	MW171D, MW171S, MW172, MW240D, MW281S, MW282S, MW329, MW340D, MW340S, MW342D, MW344D, MW344S, MW354S
	Former Fire Training Area (Facility 479)	MW166, MW167, MW168, MW169D, MW169S
	HWC Pump Station 7 (PS7)	MW134D, MW134I, MW245D, MW245S, MW317D, MW317S
	Lake Cochran	MW108D, MW108S, MW109D, MW175D, MW179D, MW179S, MW466, MW468
	North East Landfill	MW406
	Northern Boundary	MW155
	Trade Waste Treatment (Facility 480)	MW106D, MW106S, MW208, MW210D, MW210S, MW304, MW441, MW886

Management zone	Area	Locations
Primary Management Zone	Cabbage Tree Road	MW126D, MW126S, MW178, MW238D*, MW238S*
	Southern Area	MW104D*, MW104S*, MW177, MW184D*, MW184S*, MW185S*, MW188D, MW188S, MW220S, MW731D, MW731S
	Southern Area - Cabbage Tree Road	MW271D, MW271S, MW278D, MW278S
Secondary Management Zone	Cabbage Tree Road	MW125D, MW125S, MW230S
	East of base - HWC Pump Station 9 (PS9)	MW130D, MW130S, MW132D, MW132I, MW160, MW318D, MW318S, MW829, MW897D, MW897S
	East of base – Moors Drain	MW121, MW161D, MW161S, MW247D, MW247S, POT046
	East of base – Nelson Bay Road	MW122, MW162D, MW162S
	Fullerton Cove	MW144, MW147D, MW147S, MW536, MW537
	Lavis Lane	MW195, MW279S
	Salt Ash	MW123, MW255D, MW255S, MW256D, MW256S, MW257D, MW257S, MW260D, MW260S
	South of base – Nelson Bay Road	MW150D, MW150S
	Southern Area - Cabbage Tree Road	MW146AD, MW146S
	West of base	MW107D, MW107S, MW315D, MW315S
Broader Management Zone	Cabbage Tree Road	MW124**, MW139, POT085*, POT107
	East of base - HWC Pump Station 9 (PS9)	MW159D, MW159S, MW842, MW844
	Fullerton Cove	MW142D, MW142S, MW231D, MW231S, MW232D, MW232S, MW266D*, MW266S, MW268D**, MW268S**, MW270D, MW270S, MW538, POT236*, POT303, POT365, POT382
	Lavis Lane	MW128D, MW128S, MW163, MW316D
	Salt Ash	MW118, MW165*, MW252S*, POT144
	West of base	MW280S
Outside BMZ	Cabbage Tree Road	MW137
	North of base – Background	MW264D, MW264S
	Salt Ash	MW262D, MW262S
	West of base	MW241D, MW241S

Management zone	Area	Locations
Surface Water		
On-base	Dawsons Drain (Lake Cochran)	SW055
	Lake Cochran	SW108, SW110

Outside Broader Management Zone	Fullerton Cove (tidal gate outlet)	SD254, SD255, SD326

Notes:

* Groundwater monitoring location unable to be sampled during the scheduled event/s in the monitoring period.

** Gauge-only groundwater monitoring location.

7.1.2 Use of historical data

In addition to the OMP data, AECOM has also considered the historical data for on-base and off-base areas that are available in the Defence database. Historical data have been included in the analytical result tables and Mann-Kendall analysis table, **Table T5 to Table T8** (in **Appendix B**), as well as in temporal trend graphs for select PFAS compounds presented in **Appendix C**.

The Mann-Kendall analysis was used to assess the trends in the concentrations in groundwater only, and whether they have a monotonic upward or downward trend. Mann-Kendall analysis was not used to assess the trends in PFAS concentrations in surface waters or sediments, given that variables such as rainfall, which influence PFAS concentrations are not factored into the analysis.

Temporal trend graphs for PFOS, PFHxS, PFOA and PFBS were prepared for groundwater results, while temporal trend graphs for PFOS+PFHxS and PFOA were prepared for surface water and sediment results, all against the 30-day average daily rainfall total (in mm) to allow for assessment of the influence of rainfall on PFAS concentrations. The temporal trend graphs identify the monitoring period as well as new maximum concentrations within the monitoring period. Where concentrations were below the LOR, these were presented on the graphs as half the LOR value.

7.2 Groundwater results

7.2.1 Groundwater field observations

Groundwater monitoring well condition and field observations at the locations visited are provided in **Table T1** and **Table T2** in **Appendix B** and key observations are summarised below:

April 2025

- MW104D, MW104S, MW184D, and MW184S: located at Newcastle Airport, were destroyed by construction works.
- MW106D, MW108D, MW108S, MW172, MW179D, MW264S: were found to be blocked close to the base of the wells; however, groundwater was able to be sampled from within the screen interval at these locations, and the samples collected were considered representative of groundwater conditions.
- MW109D: the well gatic was full of water above the top of casing, which was removed prior to sampling. Given the J-cap was secure, water ingress into the well was unlikely, and the sample collected was considered representative of groundwater conditions.
- MW165: the well could not be located due to overgrown grass.
- MW252S: flood waters were covering the monitoring well and therefore was not sampled. Note that the location was visited on separate occasions during the sampling event; however, the flood water had not subsided.
- MW266D: the gatic bolts were rusted and the well could not be opened.
- No visible signs of contamination were observed in the groundwater at the locations sampled.
- Organic and sulphurous odours were noted in groundwater at 51 locations.

October 2025

- MW107D, MW107S, MW130D, MW130S, MW252S, MW280S, MW315D, MW315S: flood waters were covering the monitoring wells and therefore were not sampled. Note that the locations were visited on separate occasions during the sampling event; however, the flood water had not subsided.
- MW165: the well could not be located due to overgrown grass.
- MW177, MW264S: the wells were partially blocked due to roots; however, groundwater was able to be sampled from within the screen interval at these locations, and the samples collected were considered representative of groundwater conditions.
- MW266D: the gatic bolts were rusted and the well could not be opened.
- No visible signs of contamination were observed in the groundwater at the locations sampled.
- Organic and/or sulphurous odours were noted in groundwater at 38 locations.

7.2.2 Groundwater elevations

The standing water level (SWL) was measured in each monitoring well prior to sampling, and in select monitoring wells during a targeted gauging round conducted during each monitoring event, to evaluate groundwater elevations (GWE). The SWL and GWE from the monitoring period are presented in **Table T1** in **Appendix B** and are summarised below in **Table 9** for shallow/intermediate and deep aquifers.

Table 9 Summary of groundwater elevations

Gauging Event	No. Wells	Min. SWL (mbTOC)	Max. SWL (mbTOC)	Min. GWE (mAHD)	Max. GWE (mAHD)
Shallow/Intermediate aquifer					
April 2025	90	0.000 (multiple)	3.65 (MW304)	-0.038 (MW128S)	8.652 (MW264S)
October 2025	58	0.139 (MW264S)	4.846 (MW177)	-0.710 (MW829)	9.353 (MW264S)
Deep aquifer					
April 2025	55	0.000 (multiple)	2.775 (MW210D)	0.300 (MW316D)	8.663 (MW264D)
October 2025	36	0.045 (MW264D)	1.895 (MW162D)	0.326 (MW231D)	9.302 (MW264D)

Note: mAHD = metres relative to Australian Height datum, mbTOC = metres below Top of Casing.

Min = Minimum, Max = Maximum

GWEs for both shallow and deep groundwater aquifers were similar between the April 2025 and October 2025 monitoring events, with fluctuations generally less than 0.5 meters (but up to 0.7 meters reported at some locations). These variations are likely associated with elevated rainfall and episodic flooding observed during the monitoring period. Overall, GWEs remained within the historical ranges established between 2019 and 2024.

Historically a strong correlation between rainfall and groundwater level fluctuation at the base has been observed. Typically, large rainfall events result in a rapid rise in groundwater levels, followed by a relatively slow decline. This pattern was confirmed during the monitoring event as most wells recorded their highest groundwater elevation during the April 2025 to June 2025 period (annual event), with levels recorded in October 2025 generally slightly lower or unchanged compared to annual event. Note that some locations remained inaccessible due to lingering flood waters.

7.2.3 Groundwater flow directions

The SWLs measured in groundwater monitoring wells during each event were converted to groundwater elevations (in mAHD). Depth to groundwater measurements is presented in **Table T1** in **Appendix B**. The inferred potentiometric contours are presented in **Appendix A**, in **Figure F5** (shallow aquifer interval) and **Figure F6** (deep aquifer interval) for the April 2025 sampling event, and in **Figure F7** (shallow aquifer interval) and **Figure F8** (deep aquifer interval) for the October 2025 sampling event.

Groundwater flow directions in the Tomago Sand Beds aquifer within the monitored area remained consistent with historical trends, with flow inferred to the south towards Fullerton Cove in the western portion of base, and southeast towards Tilligerry Creek in the eastern portion of the base. Groundwater flow in the Stockton Sand Beds aquifer, located between Tilligerry Creek and the Newcastle Bight, was inferred to be in a northerly direction, towards Tilligerry Creek.

The flow directions were consistent across both the shallow and deep groundwater profiles with those measured throughout the previous monitoring periods.

7.2.4 Groundwater quality parameters

Groundwater quality parameters were measured during the collection of groundwater samples. The stabilised readings of groundwater quality parameters from the monitoring period are presented in **Table T2** in **Appendix B**, and summarised below in **Table 10**.

The readings (refer to **Table 10**) indicate groundwater conditions during the monitoring period to be:

- poor to well oxygenated
- fresh to saline
- acidic to mildly alkaline
- reducing to mildly oxidising conditions.

Overall, the water quality parameters reported during the monitoring period were within historical data ranges for the monitoring bores concerned.

Table 10 Summary of groundwater quality parameters

Sampling Event	Dissolved Oxygen (mg/L)		Temperature (°C)		Electrical Conductivity (µS/cm)		pH (pH units)		Oxidation-Reduction Potential, corrected (mV)	
	Min	Max	Min	Max	Min	Max	Min	Max	Min	Max
On-base										
April 2025	0.93 (MW179D)	5.01 (MW342D)	18.6 (MW340D)	24.6 (MW886)	51.4 (MW200)	269.6 (MW210S)	4.11 (MW245S)	6.68 (MW109D)	46.3 (MW171D)	437.5 (MW167)
October 2025	0.77 (MW340S)	4.04 (MW168)	13.2 (MW329)	17.9 (MW106D)	55.1 (MW166)	238.9 (MW344D)	4.18 (MW282S)	6.88 (MW344D)	61.4 (MW109D)	394.8 (MW240D)
Primary Management Zone										
April 2025	1.28 (MW188D)	6.04 (MW126S)	19.3 (MW271D)	22.0 (MW188S)	166.8 (MW188D)	686.0 (MW188S)	5.42 (MW271S)	6.93 (MW188S)	97.3 (MW278D)	238.9 (MW271D)
October 2025	0.66 (MW278S)	2.61 (MW177)	14.4 (MW271D)	19.8 (MW220S)	61.6 (MW178)	3,547 (MW731D)	5.28 (MW271S)	6.55 (MW271D)	16.9 (MW278S)	232.9 (MW126D)
Secondary Management Zone										
April 2025	1.56 (MW262S)	6.91 (MW125D)	17.6 (MW144)	24.9 (MW255S)	40.6 (MW257D)	30,405 (MW147D)	4.17 (MW132I)	7.01 (MW897D)	39.5 (MW161S)	438.4 (MW829)
October 2025	0.16 (MW144)	3.24 (MW829)	14.0 (MW536)	18.7 (multiple)	61.5 (MW247D)	23,264 (MW536)	4.34 (MW247D)	8.18 (MW144)	-76.3 (MW144)	337.1 (MW829)
Broader Management Zone										
April 2025	1.71 (POT303)	8.13 (MW231D)	17.5 (MW538)	26.9 (POT144)	89.9 (MW844)	41,842 (MW266S)	4.84 (MW280S)	7.82 (MW128D)	-1.7 (MW231D)	415.1 (POT365)
October 2025	0.35 (MW231D)	2.69 (POT365)	15.1 (MW142D)	25.1 (POT382)	97.0 (MW270D)	42,300 (MW266S)	4.88 (MW139)	7.68 (MW128D)	25.9 (MW231D)	315.6 (POT365)
Outside Broader Management Zone										
April 2025	0.69 (MW262S)	3.44 (MW241S)	17.0 (MW262D)	22.0 (MW241S)	77.7 (MW241S)	39,447 (MW262D)	4.58 (MW137)	6.84 (MW262S)	57.2 (MW262S)	197.1 (MW264D)
October 2025	1.14 (MW264D)	1.99 (MW241S)	14.5 (MW264S)	20.0 (multiple)	82.4 (MW241S)	3,586 (MW262S)	4.31 (MW264S)	6.14 (MW264D)	90.0 (MW264S)	154.3 (MW137)

7.2.5 Groundwater analytical results

Groundwater analytical results from the monitoring period as well as available historical groundwater analytical results for OMP sampling locations (including data from other projects) are presented in **Table T5** in **Appendix B**. Mann-Kendall Analysis for the same dataset is presented in **Table T8** in **Appendix B**. A summary of groundwater analytical results for each event during the monitoring period is provided in **Table 11** for all OMP locations. A summary of Mann-Kendall trends for groundwater sampling location is presented in **Table 12**, grouped by source areas and areas of interest (noting that only decreasing or increasing trends are displayed, excluding where there were no trends).

Deviations from the historical groundwater data are presented on **Figure F17** in **Appendix A**.

Groundwater results for PFOS, PFHxS, PFOA and PFBS across the monitoring period (the highest concentrations at each location) are presented spatially on **Figure F9** to **Figure F12** in **Appendix A**. Additionally, OMP and other historical groundwater concentrations of PFOS, PFHxS, PFOA and PFBS have been displayed graphically on temporal trend graphs in **Appendix C**, grouped by source areas and areas of interest. A review of the temporal trend graphs indicated that for the majority of groundwater monitoring locations on-base and across the Williamstown Management Area, no clear trends were visible. A high degree of seasonal variability, including potential response to rainfall, is observed across the majority of locations. The clearest potential trends were observed for monitoring wells in the Western Region (refer to **Graph G29** to **Graph G40**, in **Appendix C**), where concentrations continue to decrease for PFOS, PFHxS, PFOA and PFBS in selected monitoring wells.

The interpretive assessment of the groundwater analytical results is discussed in detail in **Section 8.0**.

Overall, the data presented suggests that while there are some localised areas of increasing or decreasing concentrations, there has been no significant changes in PFAS concentrations in groundwater at the base and across the Williamstown Management Area during the monitoring period.

Table 11 Summary of PFOA, PFOS, PFHxS, PFOS+PFHxS and PFBS concentrations in groundwater

Sampling Event	No. of Samples ¹	Compound	Concentration Range [in µg/L] in Sampling Event (Location/s)	No. of Samples ¹ with Concentration > LOR	No. of Samples ¹ with Exceedances of Human Health Criteria	No. of Samples ¹ with Exceedances of Ecological Criteria

Notes:¹ = Sample counts include intra-laboratory and inter-laboratory duplicates

multiple = the value applies to multiple locations

NA = Not applicable – where there are no applicable Human Health screening criteria for PFOS, PFHxS and PFBS (when screening on-base locations for recreation use criteria only), and no applicable Ecological screening criteria for the PFHxS, PFOS+PFHxS and PFBS.

Human health criteria relate to recreational criteria for locations on the base and both drinking water and recreational criteria for all off-base locations.

QC = Quality Control (sample)

Table 12 Summary of Mann-Kendall Trend Analysis

Notes:

(*) New detection reported due to lower LOR, no previous detection at standard LOR

BOLD text denotes a “Significant” new maximum, being > 1 order of magnitude above the historical maximum, or >1 order of magnitude above the standard laboratory LOR where historical concentrations were all below the standard LOR

7.3 Surface water results

7.3.1 Surface water field observations

Surface water field observations from the monitoring period are presented in **Table T3** in **Appendix B** and key observations are summarised below.

April 2025

- No visible signs of contamination were observed in the surface water locations sampled
- Organic and sulphurous odours were noted at SW582 and SW600
- Water flows were observed at approximately half the surface water locations with water depths varying between 0.5 m (at SW055 and SW007) and 2 m (at SW110 and SW023).

October 2025

- No visible signs of contamination were observed in the surface water locations sampled
- Organic and/or sulphurous odours were noted during sampling at SW600
- Water flows were observed at approximately half the surface water locations with water depths varying between 0.2 m (at SW582) and 2 m (at SW333).

7.3.2 Surface water quality parameters

Surface water quality parameters were measured during the collection of surface water samples. The surface water quality parameters for each event during the monitoring period are presented in **Table T3** in **Appendix B**, and summarised in **Table 13** for the monitoring period. The key findings were:

- Generally oxygenated conditions
- Generally fresh, with some brackish water (over 1,500 $\mu\text{S}/\text{cm}$)
- Mildly acidic to near neutral conditions
- Moderately oxidising to moderately reducing conditions
- Temperature ranges are considered consistent with background conditions for the time of year of the sampling being conducted in each event.

The water quality parameters reported during the monitoring period were generally within historical data ranges.

Table 13 Summary of surface water quality parameters

Sampling Event	Dissolved Oxygen [in mg/L]		Temperature (°C)		Electrical Conductivity (µS/cm)		pH (pH units)		Oxidation-Reduction Potential, corrected (mV)	
	Min	Max	Min	Max	Min	Max	Min	Max	Min	Max

7.3.3 Surface water analytical results

Surface water analytical results from the monitoring period as well as the available historical surface water analytical results for OMP sampling locations (including data from other projects) are presented in **Table T6** in **Appendix B**. A summary of surface water results for each event during the monitoring period are provided in **Table 14**.

Surface water results for PFOS+PFHxS and PFOA across the monitoring period (the highest concentrations at each location) are presented spatially on **Figure F13** to **Figure F14** in **Appendix A**. Additionally, OMP and other historical concentrations of PFOS+PFHxS and PFOA for surface water are displayed graphically on temporal trend graphs in **Appendix C**, grouped by catchment/area of interest.

The interpretive assessment of the surface water analytical results is discussed in detail in **Section 8.0**.

Overall, the data presented suggests that concentrations of PFAS in surface water are variable, with some locations reporting higher concentrations during the summer (drier months) when compared to the wetter and colder winter months. At on-base surface water location SW048, a potential increasing trend is visible for PFOS+PFHxS (refer to **Graph G146** in **Appendix C**), noting that the new maximum reported during the 2025 monitoring period was within the same order of magnitude as historical results. The remaining on-base locations showed no potential trends with majority of the reported concentrations during the monitoring period being within the historical ranges. No significant deviations from the historical surface water data were identified during the monitoring period (refer to **Figure F18** in **Appendix A**).

Table 14 Summary of PFOA, PFOS and PFOS+PFHxS concentrations in surface water

Sampling Event	No. of Samples ¹	Compound	Concentration Range [in µg/L] in Sampling Event (Location/s)	No. of Samples ¹ with Concentration > LOR	No. of Samples ¹ with Exceedances of Human Health Criteria	No. of Samples ¹ with Exceedances of Ecological Criteria

7.4 Sediment Results

7.4.1 Sediment field observations

Sediment field observations from the monitoring period are presented in **Table T4** in **Appendix B**.

The sediment comprised of sand, silt and clay materials, some with trace gravels and shell fragments, and some inclusive of organic matter in the form of roots, leaves and/or grass. Organic odours were noted during the April 2025 sampling event, at SD005, SD081 and SD600, while during the October 2025 sampling event, an organic odour was noted at SD600, and a sulphurous odour was noted at SD001.

7.4.2 Sediment analytical results

Sediment analytical results from the monitoring period as well as the available historical sediment analytical results (including data from other projects) are presented in **Table T7** in **Appendix B**. A summary of sediment results for each event during the monitoring period are provided in **Table 15**.

Sediment results for PFOS+PFHxS and PFOA across the monitoring period (the highest concentrations at each location) are presented spatially on **Figure F15** to **Figure F16** in **Appendix A**. Additionally, OMP and other historical concentrations of PFOS+PFHxS and PFOA for sediment have been displayed graphically on temporal trend graphs in **Appendix C**, grouped by catchment/area of interest.

The interpretive assessment of the sediment analytical results is discussed in detail in **Section 8.0**.

Overall, based on the analytical tables and the temporal trend graphs, concentrations of PFAS in sediment were generally stable, with majority of the concentrations reported during the monitoring period being within the historical range and/or within the same order of magnitude of historical results. New maximum concentrations were recorded in the monitoring period at SD326 and SD254 in Fullerton Cove (tidal gate outlet) and in SD600 in Fourteen Foot Drain; however, these are not significant new maximums, given they were within the same order of magnitude as historical results. No significant deviations from the historical sediment data were identified during the monitoring period (refer to **Figure F19** in **Appendix A**).

Table 15 Summary of PFOA, PFOS and PFOS+PFHxS concentrations in sediment

8.0 Interpretive analysis and discussion

The assessment of analytical results from this monitoring period against the OMP trigger levels and associated responses is presented in **Table 21**.

Table 21 Trigger levels Assessment

Trigger	Discussion
Spatial and temporal variability	
First-time detect of PFAS at a monitoring location not associated with a known on-base PFAS source area that may suggest that an off-base source unrelated to Defence activities is present. <i>To be considered potentially significant if above relevant screening criteria and repeat detections occur over two subsequent monitoring events.</i>	During the 2025 monitoring period, there were a number of groundwater locations that reported first-time detections of PFAS compounds, however they are not considered to suggest the presence of an off-base source unrelated to Defence activities. During the April 2025 event, first-time detections of one or more PFAS were reported in two groundwater locations outside of the Williamstown Management Area, being MW262S to the east of Salt Ash, and MW264D to the north (up hydraulic gradient) of the base. Given that PFAS were not reported in these two locations during the subsequent October 2025 event, they are not considered to be significant. Also, during the April 2025 event, six groundwater locations (MW118, MW139, MW142D, MW142S, MW266S and POT365) within the BMZ reported first-time detections of one or more PFAS. The reported concentrations of PFAS in these samples were due to the use of low-level detection method (below the standard LOR). However, with the exception of MW266S the detections were not repeated during the subsequent October 2025 event. The reported PFAS concentrations in MW266S were below the adopted human health (drinking water) screening criteria. Therefore, these first-time detections are not considered to be significant given that low concentrations of PFAS are expected across the BMZ. There were no first-time detections of PFAS in the surface water and sediment samples analysed during the 2025 monitoring period.
First-time detect of PFAS at a monitoring location down gradient of the PFAS plume that suggests PFAS migration is occurring. <i>To be considered potentially significant if above relevant screening criteria and repeat detections occur over two subsequent monitoring events</i>	During the 2025 monitoring period, first-time detections of PFAS were reported in four groundwater wells (MW144, MW536, MW537 and MW538) located between the base and Fullerton Cove. Monitoring locations MW144, MW536 and MW537 are located within the Secondary Management Zone and are located adjacent to Dawsons Drain. MW538 is located approximately 100m further south within the Broader Management Zone and is adjacent to the Fourteen Foot Drain. It is noted that these wells had not been sampled

Trigger	Discussion
	since 2017, at which time concentrations of PFAS were below the laboratory LOR. AECOM considers that the detections of PFAS over two subsequent monitoring events in these wells during the 2025 monitoring period indicate that surface water / groundwater interactions along Dawsons Drain and the Fourteen Foot Drain have contributed to the PFAS being detected in the monitoring wells in this area. Defence will continue to monitor PFAS in this area under the OMP.
New maximum at a monitoring location (a concentration that is considered to be “significant” within the context of the CSM) <i>Note that new maximum concentrations reported within a known PFAS source area is likely to be less “significant” to the CSM than a new maximum reported outside (upgradient or downgradient) of a known PFAS source area.</i> <i>Consider laboratory variability of 30%.</i> <i>*Significant is considered to be one order of magnitude higher or greater than historical ranges.</i>	During the 2025 monitoring period, several groundwater locations reported new maximum concentrations of PFAS. With the exception of locations MW144, MW169S and MW538, the reported new maximum concentrations were noted to be either within one order of magnitude of historical maximums, or within one order of magnitude of the standard laboratory LOR and therefore are not considered to be significant. Given that MW169S is located on-base within a known source area (FFTA), the new maximum concentration for PFOS (3.15 µg/L) is not considered to be significant in the context of the CSM. The new maximum concentration for PFOS (0.189 µg/L) and PFOS+PFHxS (0.276 µg/L) in MW144 and PFOS+PFHxS (0.548 µg/L) in MW538, both located south of the base near Fullerton Cove (adjacent to the 14 Foot Drain) may be an indicator that surface water / groundwater interaction is contributing to the new maximum concentrations in this area. It is noted that this was the first time these two wells had been sampled since 2017, and there is insufficient data to determine whether these new maximums indicate increasing trends. Defence will continue to monitor PFAS in this area under the OMP. Concentrations of PFAS were either within the historical range, or within an order of magnitude of the historical maximums, in the surface water and sediment samples analysed during the monitoring period.

Trigger	Discussion
Increasing trend in groundwater concentrations at base boundary or off-base monitoring locations <i>Trends are to be determined using a statistical tool (i.e. Mann-Kendall) with a minimum of four (4) data points with concentrations greater than the laboratory LOR.</i>	Statistical analysis of groundwater data (current and historical) identified increasing trends of one or more of PFOS, PFHxS, PFOA and/or PFBS at numerous locations on base boundary and off-base areas, as summarised below: • four on-base locations (MW108D, MW108S, MW342D, MW344D) in the Western Region, specifically on the southern boundary of the base. The increasing trend of PFAS concentrations in these locations are associated with the migration of the leading edge of the Western Region plume originating from the FFTA and are consistent with predictions of the historical groundwater modelling. It is noted that groundwater in this area is captured and treated by the Western Region WTP • Six on-base locations (MW172, MW175D, MW179S, MW179D, MW202D and MW441) in the Central Region. Concentrations of PFAS in groundwater at these locations appear to be variable and have typically been within the same order of magnitude since first sampled in 2016. The statistical increasing trends identified at these locations are therefore not considered to be significant in the context of the CSM • three off-base locations (MW126S, MW178 and MW271S) within the Primary Management Zone to the south of the base. While the statistical tool reports that increasing trends are present for PFOS, PFHxS, PFOA and/or PFOS+PFHxS in these locations, a review of the temporal trend graphs (Graphs 1 – 8 in Appendix C) indicates that concentrations in these wells fluctuate over time and have typically remained within the same order of magnitude over the past seven years of monitoring. Therefore, the statistical increasing trends identified in these locations are not considered to be significant in the context of the CSM • four off-base locations (MW125D, MW230S, MW146AD, MW146S) within the Secondary Management Zone to the south of the base. While the statistical tool reports that increasing trends are present for PFOS, PFHxS, PFOA and/or PFOS+PFHxS in these locations, a review of the temporal trend graphs (Graphs G1 – G8 in Appendix C) indicates that the statistically increasing trends are more associated with the adoption of the lower laboratory LOR during the current monitoring period and that concentrations of PFAS in these wells have typically remained within the

Trigger	Discussion
	same order of magnitude since monitoring commenced in 2017. Therefore, the statistical increasing trends identified in these locations are not considered to be significant in the context of the CSM - Seven off-base locations within the Secondary Management Zone to the east of the base, including four (MW130D, MW132D, MW318D, MW318S and MW829) near HWC Pump Station 9 and two (MW121, MW247D) along Moors Drain. A review of the historical PFAS concentration data for MW130D and MW318S suggest that the statistically increasing trend at these locations are associated with the adoption of a lower laboratory limit of reporting during the current monitoring period. PFAS concentrations have consistently been either below the standard laboratory LOR, or within one order of magnitude of the standard laboratory LOR. Therefore, these statistically increasing trends are not considered to be significant in the context of the CSM. Similarly, a review of historical analytical data for monitoring locations MW121, MW132D, MW247D, MW318D and MW829 indicates that concentrations of PFAS have been variable but typically within the same order of magnitude over the past seven year and are not considered to be significant in the context of the CSM. - three off-base locations (MW107S, MW315D, MW315S) within the Secondary Management Zone, to the west of the base. In MW107S and MW315S, concentrations of PFAS in these wells have historically been low (either below the standard LOR, or trace levels reported above the lower-level LOR). Given that concentrations have remained below the NHMRC drinking water guidelines in these wells since 2021, the statistically increasing trends are not considered to be significant in the context of the CSM. At location MW315D, a review of the historical groundwater data in Table T5 (Appendix B) and the temporal trend graphs (G105 to G108 in Appendix C) indicates that there is likely an increasing trend present. This increasing trend may be associated with the migration of the Western Region plume in the deep zone, and will continue to be monitored to assess whether it constitutes a change to the CSM - Four off-base locations within the Broader Management Zone, including one to the east of HWC Pump Station 9 (MW159S), one in the vicinity of

Trigger	Discussion
	Fullerton Cove (MW270S), two to the southeast of the base in the vicinity of Lavis Lane (MW128D and MW280S) and one to the west of the base (MW280S). While statistical increasing trends were reported for these locations, a review of the historical PFAS concentration data (Table T5 in Appendix B) for these locations indicate that concentrations are consistently low, either below the laboratory LOR, or within the same order of magnitude as historical results. Therefore, the statistical increasing trends are not considered to be significant in the context of the CSM
Decreasing trend in groundwater concentrations at a monitoring location or within a specified area <i>Trends are to be determined using a statistical tool (i.e. Mann-Kendall) with a minimum of four (4) data points with concentrations greater than the laboratory LOR.</i> <i>Monitoring locations may be considered to be removed from the OMP if no longer required to assess the CSM and risk profile.</i>	Statistical analysis of groundwater data (current and historical) identified decreasing trends of one or more PFAS in numerous on- and off-base areas, as discussed below: • 13 on-base locations (MW166, MW167, MW168, MW169D, MW169S, MW171S, MW240D, MW281S, MW282S, MW329, MW340S, MW344S, MW354S) within the Western Region, associated with the FFTA. The decreasing trends are likely associated with the reduction in concentrations at the “tail” of the western plume as it moves south. • two on-base locations (MW134D, MW134I) at the HWC Pump Station 7 area. The reason for the decreasing PFAS trend at these locations is unknown, however given the lack of PFAS sources in this area, it is not unexpected. • six on-base locations within the Central Region, including two (MW196 and MW202S) at the Former and Current Fire Station and four (MW108S, MW109D, MW466, MW468) near Lake Cochran. These localised decreasing trends are considered likely to be attributed to removal of ongoing PFAS sources, including historical remedial activities undertaken at the Former and Current Fire Station (Facility 165) in 2019 and 2020. • three on-base locations (MW106D, MW106S, MW210D) in the Central Region near the Trade Waste Treatment facility. The cause of the decreasing trend at this location is unknown, however it will continue to be monitored during future sampling events. • three off-base locations (MW104D, MW184D, MW184S) in the Primary Management Zone, specifically within the Southern Area. The decreasing concentrations of PFAS at these locations within the Primary

Trigger	Discussion
	Management Zone area likely to be associated with the southerly migration of the Central Region plume, and the contraction of the tail end as it passes these locations • 11 off-base locations within the Secondary Management Zone, including one (MW125S) location along Cabbage Tree Road, three (MW132D, MW132I, MW897D) east of base near HWC Pump Station 9, three (MW161D, MW161S, MW247S) east of the base along Moors Drain, two (MW123, MW260S) locations in Salt Ash and one (MW315D) location to the west of the base. The decreasing trends in these locations are not attributed to any single factor or action and are considered to represent localised variability in the distribution of PFAS off base within the Secondary Management Area. • two off-base locations within the Broader Management Zone, including one (MW252S) near Salt Ash and one (POT107) along Cabbage Tree Road. The decreasing trends are considered to be associated with localised variability, rather than indicative of broader decreasing trends in the Broader Management Zone.
Changes to the CSM	
New human health or ecological receptor or exposure path identified associated with a known on-base source area. <i>New information regarding exposure pathways or receptors may be identified via an updated water use survey, change in land use, new monitoring location, or field observations.</i>	No new human health or ecological exposure pathways associated with a known on-base source area were identified during the 2025 monitoring period that have not previously been identified and assessed.
Drinking water pathway identified in off-base property directly associated with a known on-base source area. <i>New information regarding exposure pathways or receptors may be identified via an updated water use survey, change in land use, new monitoring location, or field observations.</i>	No new drinking water pathways in off-base properties associated with a known on-base source area were identified during the 2025 monitoring period.

Trigger	Discussion
Recreational water pathway identified in off-base property directly associated with a known on-base source area. <i>New information regarding exposure pathways or receptors may be identified via an updated water use survey, change in land use, new monitoring location, or field observations.</i>	No new recreational water pathway was identified in off-base properties directly associated with a known on-base source area during the 2025 monitoring period.
Human Health and Ecological Receptors	
New exceedance of published screening criteria of an off-base or base boundary monitoring location down gradient of an identified PFAS source area, that suggests PFAS migration from a known PFAS source area <i>To be considered potentially significant if repeat exceedances occur over two subsequent monitoring events.</i>	The first-time exceedances of human health and/or ecological screening criteria for PFOS and/or PFHxS in monitoring wells MW144, MW536, MW537 and MW538 during the 2025 monitoring period may be indicative surface water/groundwater interactions along Dawsons Drain and the 14-foot drain contributing to new maximums in this area. Additionally, first time exceedances of the adopted new ecological screening criteria for PFOS were reported in six off-base groundwater locations (MW231S, MW262S, MW271S, MW536, MW537, MW842) during the monitoring period. Given that historically the concentrations of PFOS exceeded the previous ecological criteria (PFAS NEMP, 2020), the exceedance of the new criteria is not considered to be material as it does not change the conclusions of the ERA (AECOM, 2018) and the risk profile. No other new exceedances of published screening criteria which are considered to be potentially significant were reported during the 2025 monitoring period.
First-time exceedance in groundwater of the groundwater exposure point concentration (EPC) used in the 2017 HHRA for the relevant Risk Zone: Risk Zone A PFOS+PFHxS: 190.3 µg/L Risk Zone B PFOS+PFHxS: 5.67 µg/L Risk Zone C & D	There were no first-time exceedances of the groundwater EPC in Risk Zone A or Risk Zone B during the 2025 monitoring period. First time exceedances of the groundwater EPCs for PFOS+PFHxS in Risk Zone C & D were reported during the April 2025 monitoring event in the following locations: • MW144 (0.086 µg/L) [Risk Zone C] • MW231S (0.1 µg/L) [Risk Zone C] • MW536 (0.052 µg/L) [Risk Zone C]

Trigger	Discussion
PFOS+PFHxS: 0.05 µg/L	• MW538 (0.43 µg/L) [Risk Zone C] First-time exceedances of the groundwater EPCs for PFOS+PFHxS in Risk Zone C & D were reported during the October 2025 monitoring event in the following locations: • MW271D (0.054 µg/L) [Risk Zone C] • MW537 (0.074 µg/L) [Risk Zone C] Given that all the locations which reported first-time exceedances of the groundwater EPCs were within the Williamstown Management Area, there are no changes to the associated risk profile given that these areas are subject to precautionary advice to minimise exposure to PFAS.
First-time exceedance in surface water of the surface water EPC used in the 2017 HHRA: Marine Water PFOS: 1.78 µg/L, PFHxS: 1.48 µg/L Region 1 PFOS: 5.035 µg/L, PFHxS: 1.666 µg/L Region 2 PFOS: 1.47 µg/L, PFHxS: 1.009 µg/L Region 3 PFOS: 7.743 µg/L, PFHxS: 6.773 µg/L	First time exceedance of the surface water EPC for PFHxS in Region 1 was reported during the October 2025 monitoring event in Moors Drain sample SW006 (7.36 µg/L). No other first-time exceedances of the surface water EPCs were reported during the 2025 monitoring period. Given that the location of SW006 falls within the Secondary Management Zone, there are no changes to the associated risk profile given that this area is subject to precautionary advice to minimise exposure to PFAS.

Trigger	Discussion
Other Considerations	
Changes to Precautionary Advice by NSW Government <i>The OMP will consider any changes made by the NSW Government to precautionary advice.</i>	There were no changes to the NSW Government precautionary advice relating to the Williamstown Management Area during the 2025 monitoring period.
Changes to endorsed screening criteria in Australia	During the 2025 monitoring period, the updated NHMRC (2025) drinking water screening criteria for PFOS, PFHxS, PFOA and PFBA were finalised. These revised criteria have subsequently been adopted for the OMP, superseding the PFAS NEMP 3.0 (2025) values. The lower screening criteria for PFOS (by an order of magnitude) has resulted in new first-time exceedances during this morning period at locations that were previous below the former PFAS NEMP 3.0 (2025) drinking water criteria. In March 2026 (following the 2025 monitoring period), revised Australian and New Zealand Guidelines were released for PFOS in water for ecological receptors. The revised 99% ecological protection value (0.02 µg/L) is two orders of magnitude higher than the previous value (0.00023 µg/L). This has resulted in fewer ecological exceedances in surface water and groundwater.

Notes: Risk Zones and Regions as defined in the HHRA (AECOM, 2017b), detailed below.

- **Marine Water:** various water bodies such as those associated with Port Stephens and Hunter River (i.e. Fullerton Cove for the purpose of the OMP)
- **Region 1:** the area east of the base, generally following Moors Drain and discharging at the tidal portion of Tilligerry Creek.
- **Region 2:** the area along Tilligerry Creek southeast of the base which discharges in the tidal portion of Tilligerry Creek
- **Region 3:** the surface water drainage network south of the base, which predominantly discharges at Fullerton Cove.
- **Risk Zone A** is defined by the footprint of the Southern Area, which includes a portion of Region 3.
- **Risk Zone B** is defined by the footprint of the Eastern Area, which includes a portion of both Region 1 and Region 3.
- **Risk Zone C** is defined by that portion of the footprint of the remaining area, which corresponds with Region 1 and Region 3.
- **Risk Zone D** is defined by that portion of the footprint of the remaining area, which corresponds with Region 2.

9.0 Conceptual Site Model

The updated PMAP (Defence, 2023b) provides a revised CSM summarising the linkages between sources, exposure pathways and receptors.

The OMP sampling events over the monitoring period have provided additional data to further understand the changing conditions of the PFAS concentrations in groundwater, surface water and sediment.

Although some localised changes were noted to the plume extents on-base as a result of remediation activities, the PFAS transport mechanisms and the general extent of the PFOS+PFHxS plume (size and shape) (refer to **Figure F20** in **Appendix A**) are inferred to remain similar to that reported previously. **Figure F20** provides the extent of the plume above former drinking water criteria of 0.07 µg/L to enable comparison to the plume map in the 2024 OMR. An additional plume map has also been prepared (refer to **Figure F21** in **Appendix A**) to show the approximate extent of the plume where concentrations of PFOS are greater than the current drinking water guideline value of 0.008 µg/L.

The inferred extent of the PFAS plume on **Figure F21** for PFOS only at low level detection limit is generally consistent with the geometry of the PFOS+PFHxS maps those reported in previous OMRs and the DSI (AECOM, 2017a) with the following exceptions:

- the inferred extent of PFOS (0.008 µg/L – 10 µg/L) in groundwater between the Cabbage Tree Road and Fullerton Cove has increased, largely due to the first-time detections of PFAS in monitoring wells MW144, MW536, MW537 and MW538. It is noted however that these first-time detections are likely to be attributed to surface water/groundwater interactions, rather than migration of the Central Region plume
- the inferred extent of PFOS (>LOR to 0.008 µg/L) in Salt Ash has been refined due to the adoption of the lower LOR in these areas.

Groundwater remains the primary pathway for PFAS migration from the base. The ongoing treatment of groundwater at the Western Region (FFTA), and Central Region (area south of Lake Cochran) coupled with previous source removal (excavation) activities at the sources in these areas, have reduced the localised PFAS concentrations in groundwater at the base. However, the on-base source-pathway-receptor (SPR) linkages identified in the CSM remain unchanged. PFAS-impacted groundwater continues to migrate south from these source areas beyond the base boundary and SPR linkages for off-base areas remain unchanged.

Surface water drainage, including interaction between surface water drains and groundwater, remains the other a significant pathway for PFAS migration from the base. The key drainage channels that drain surface water from the base to off-base areas include:

- Western and Central Regions: Dawsons Drain and Leary's Drain and (indirectly) Fourteen Foot Drain and Ten Foot Drain to the south of the base, which discharge to Fullerton Cove. Groundwater is known to upwell into Dawsons Drain and Leary's Drain, providing a direct migration pathway for PFAS-impacted groundwater to enter these drainage lines and Fullerton Cove beyond.
- Eastern Region: Moors Drain which receives runoff from the on-base piped stormwater drainage network and discharges to Tilligerry Creek. Notably the on-base stormwater network within the Eastern Region is known to interact with the shallow groundwater and provides a direct migration pathway for PFAS impacted groundwater to enter the off-base surface water environment at Moors Drain.

Despite the sandy, porous nature of the soils in the Management Area, heavy rainfall can exceed the soil infiltration rate, resulting in ponding and/or runoff on the surface and flooding, and influence the migration of PFAS into downstream sediments. Given the shallow depth to groundwater, it is also likely that these occurrences, which are transient, represent water table outcrop. Concentrations of PFAS in sediment have fluctuated over time however generally remain within the same order of magnitude as historical ranges.

No significant changes to the SPR linkages and migration mechanisms identified for surface water and sediment were apparent during the monitoring period.

The current CSM is presented in **Table 22** below and illustrated as a conceptual schematic figure in **Appendix F**.

Table 22 Conceptual Site Model

Primary Sources	Secondary Sources	Transport Mechanisms	Exposure Pathways	Exposed Population Characterisation / Receptor	Exposure pathway complete?	Risk	Risk Management
On-base areas where fire-fighting retardants/ suppression foams (primarily AFFF) have been discharged or released to the environment. PFAS soaks into soil and/or infrastructure from where it can be eroded as sediment or leached by rainwater or flood water and migrate to groundwater, or dissolve in surface water runoff and potentially travel to affect other media.	PFAS in shallow soil (<1.9 m).	Water and wind erosion of soil and atmospheric dispersion of soil and dust. Excavation and re-location of soil during construction activities.	Human health: direct contact with PFAS in soil during intrusive works (i.e. excavations)	Commercial/ Intrusive maintenance workers	Potentially complete	Potential for exposure to occur under incidental ingestion of soil and direct contact with soil (including during intrusive works) with concentrations of PFOS+PFHxS above the adopted commercial/industrial land use screening criteria (on-base source areas).	The potential risks associated with direct contact with PFAS in soils are effectively managed by existing administrative controls (required for all excavation works on-base), OHS practices and personal protective equipment (PPE)
			Ecological: Flora - direct contact with, root uptake from PFAS in soil. Fauna - ingestion of PFAS in soil and ingestion of plants which may have taken up PFAS from the soil.	On-base flora and fauna.	Complete	Reported concentrations of PFOS in surface soils, have the potential to pose an unacceptable risk to ecological receptors due to direct and indirect contact.	Ongoing remediation to reduce PFAS levels at the base. Restricting access for fauna to PFAS impacted areas on base through engineering controls (i.e. fencing)
	PFAS in groundwater.	Groundwater transport in shallow aquifer.	Human health: Direct contact with groundwater (indoor and outdoor use); via extraction from bore, irrigation spear points (on and off-base).	Commercial/ Intrusive maintenance workers	Potentially complete	Potential for exposure to occur should indirect or direct contact with concentrations of PFAS in groundwater above relevant criteria.	On-base: Managed by provision of potable water and OHS practices.
				Residential	Potentially complete*	Potential for elevated exposure to occur under typical ² and upper ³ scenarios in Risk Zone A (refer to Appendix E). The severity is variable ¹ and dependant on the type and number of pathways	Off-base: Managed by provision of an alternative water supply and ongoing management via the NSW Government precautionary advice.
	PFAS in surface water.	Surface water transport; in drains and on ground surface on and off-base.	Ecological (on and off-base): Toxicity to flora and fauna from direct exposure to PFAS in surface water.	Ecosystem (on-base and off-base).	Complete	Reported concentrations of PFOS in surface water were above 90% species protection criteria in all waterways except Fullerton Cove. The Ecological Risk Assessment (ERA) (AECOM, 2018) noted that there was the potential for unacceptable risks to native flora and fauna associated with direct contact and/or consumption of PFAS impacted surface water	Ongoing management of surface water to reduce PFAS discharges from the base. The potential risks associated with direct contact with PFAS in sediment and surface water in on-base drains and water bodies are effectively managed by existing administrative controls (required for all maintenance works on-base), OHS practices, PPE and off-base via the NSW Government precautionary advice.
			Human Health: Direct contact with surface water (on-base commercial workers, off-base recreational)	Commercial / Recreational	Potentially complete*	Elevated concentrations of PFOS in surface water within on-base and off-base drains and surface water bodies	
	PFAS in sediment.	Dispersion via surface water or via drain maintenance activities.	Ecological (on and off-base): Direct contact of terrestrial and aquatic organisms to PFAS in sediment.	Ecosystem (on-base and off-base).	Complete	Reported concentrations of PFOS in sediment (on-base drains and Dawsons Drain/ Moors Drain) have the potential for unacceptable risks to aquatic organisms.	
			Human Health: Direct contact with PFAS in sediment for commercial workers (on base)	Commercial	Potentially complete	Elevated concentrations of PFOS in sediment within on-base drains and surface water bodies	

Primary Sources	Secondary Sources	Transport Mechanisms	Exposure Pathways	Exposed Population Characterisation / Receptor	Exposure pathway complete?	Risk	Risk Management
	PFAS in pore water in sediments.	Surface water transport; in un-lined drains and as surface flow on-base and off-base.	Ecological (on and off-base): Direct contact of terrestrial and aquatic organisms to PFAS in surface water.	Ecosystem (on-base and off-base).	Complete	Reported concentrations of PFOS in surface water were above 90% species protection criteria in all waterways except Fullerton Cove. The ERA (AECOM, 2018) noted that there was the potential for unacceptable risks to native flora and fauna associated with direct contact and/or consumption of PFAS impacted surface water	
	Home grown produce.	Uptake of PFAS in soil / water by biota	Human health: Consumption of home grown produce (including fruit and vegetables, chicken eggs).	Residential	Potentially complete*	Potential for elevated exposure to occur under typical² and upper³ scenarios in Risk Zones A, B, C and D when eating eggs from home grown backyard poultry that have consumed soil or plants that have accumulated PFAS from irrigation water. Potential for elevated exposure to occur when eating vegetables that have been in irrigated or flooded with water containing detectable PFAS concentrations, under: - typical² and upper³ scenarios in Risk Zone A (refer to Appendix E). - upper³ scenarios in Risk Zone B (refer to Appendix E). The severity is variable¹ and dependant on the type and number of pathways .	Ongoing management via the NSW Government precautionary advice.
	Aquatic biota.	Uptake of PFAS in sediment / water by aquatic biota	Human health: Ingestion of aquatic organisms (including fish and shellfish).	Residential/ Commercial fishers	Potentially complete*	Potential risk of harm to human health from consumption of high quantities of locally sourced finfish, including dusky flat head, luderick, silver biddy and mullet. Potential for elevated exposure to occur for commercial fishers under upper³ scenarios in marine environment.	Ongoing management via the NSW Government precautionary advice.

Notes:

* = Pathway considered to be potentially complete for this receptor; however, management measures are currently in place to reduce the potential for exposure via this pathway. Management measures include precautions to minimise exposure recommended by NSW Government (consistent with the 2017 HHRA), and provision of an alternative water supply to eligible stakeholders by Defence.

1. Combined with other exposure pathways, this has the potential to result in overall exceedances of the tolerable daily intake (TDI). Exceeding the TDI does not mean that health effects will occur, and there is currently no conclusive evidence that exposure to PFAS will lead to health effects in humans.

2. 'Typical' represents typical and average exposure scenarios for majority of the population.

3. 'Upper' represents receptors that undertake activities at a higher frequency or ingestion, therefore apply to a small percentage of the population.

10.0 Risk profile review

10.1 Risk assessment summary

The HHRA (AECOM, 2017b) and the ERA (AECOM, 2018) assessed the potential off-base human health and environmental risks resulting from exposure to base derived PFAS in soil, sediment, groundwater and / or surface water.

The data collected during OMP monitoring between January 2025 and December 2025 indicates that the risk profile to human health and ecological receptors within the Management Area as presented in the HHRA, ERA and the PMAP (Defence, 2023b) remains unchanged. This is based on the following assessment of OMP data, particularly with reference to the OMP trigger levels assessment outlined in **Section 8.0**.

It is noted that potential PFAS exposure for land users within the Williamstown Management Area via water use and locally sourced food consumption, is managed through NSW Government Precautionary Advice which currently remains in place.

10.2 Human Health Risk Assessment

The exposure pathways where potential risks were identified as elevated in the HHRA (AECOM, 2017b) were as follows:

- Drinking groundwater (including use in cooking) where the average PFAS concentration exceeds the drinking water guidelines (FSANZ, 2017)
- Incidental ingestion of groundwater when used indoors for showering or bathing or food preparation
- Incidental ingestion of groundwater when used outdoors (including filling swimming pools and children's wading pools, sprinkler play and domestic irrigation)
- Incidental ingestion of surface water during recreational activities (including swimming in creeks and/or drains)
- Eating home grown vegetables
- Eating eggs from backyard poultry
- Eating home grown red meat
- Drinking milk from home grown cattle or using it in cooking
- Eating high quantities of locally sourced finfish.

The current data set collected under the OMP does not indicate that there is a change in the identified HHRA exposure pathways described above.

10.3 Ecological Risk Assessment

The exposure pathways where potential risks were identified as elevated in the ERA (AECOM, 2018) were as follows

- Ingestion of PFAS impacted soil, sediment or surface water by ecological receptors.
- Ingestion of organisms that have been exposed to PFAS where bioaccumulation is occurring, including aquatic and terrestrial organisms.

The current data set collected under the OMP does not indicate that there is a change in the identified ERA exposure pathways described above.

11.0 Conclusions

Groundwater, surface water and sediment sampling was completed as part of the OMP between January 2025 and December 2025. The following conclusions are based on the data collected during the monitoring period.

PFAS plume characteristics

Overall, the concentrations of PFAS in groundwater were generally similar to previous results. In several upper and mid-plume locations on-base 'decreasing' trends were identified, indicating that targeted treatment of on-base source areas has and continues to remove PFAS mass from the environment and mitigate replenishment of PFAS plumes.

At some monitoring locations downgradient of the plume fronts new maximum concentrations of PFAS were identified suggesting the cores of the plumes continue to migrate away from on-base source areas. This was most visible in monitoring wells located between Cabbage Tree Road and Fullerton Cove (to the south of the base) where first-time detections of PFAS may be indicative of increased groundwater/surface water interaction occurring along Dawsons Drain, contributing to higher PFAS concentrations in that area.

To the east of the base towards Salt Ash, the inferred extent of the plume has been refined based on the low level PFAS analysis and continues to predominately fall within the boundary of the Secondary Management Zone. An increasing trend of PFAS in one deep monitoring well to the west of the base (where concentrations have steadily increased by an order of magnitude since 2019) will continue to be monitored to assess whether it is indicative of a change to the extent of the western plume.

Elsewhere across the Williamstown Management Area, PFAS concentrations and the shape of the groundwater plume in the Primary and Secondary Management Zones were generally stable.

The overall extent of the off-base plume remains relatively consistent with the extents identified in the DSI (AECOM, 2017a).

Conceptual Site Model and Risk Summary

The CSM was reviewed, and no changes were identified to PFAS sources, pathways or receptors at the base and off-base Management Area.

While there have been localised changes in PFAS concentrations during the monitoring period, the risks profiles associated with exposure to PFAS in groundwater, surface water and sediment, and as described in the HHRA (AECOM, 2017b), have not changed and no review of exposure assumptions is required.

The potential PFAS exposure of land users off-base, within the Williamstown Management Area, regarding water use and locally sourced food consumption is currently managed through NSW Government Precautionary Advice and remains in place.

Remediation progress

- The three water treatment plants on-base removed approximately 4.1 kg of PFAS from the environment (groundwater and surface water) during this monitoring period
- The decreasing trends in concentrations in selected wells in the northern portion of the Western Region is likely to be attributable to the soil remediation and groundwater treatment at the FFTA
- The FFTA WPT in the Western Region ceased operation on 14 November 2025. The plant was upgraded and the extraction was moved to the southern boundary within the Western Region to target the PFAS plume that originated from the FFTA
- Defence is also planning to implement additional management actions to target the central plume, and potentially upgrade the Moors Drain water treatment plant, it is estimated that these proposed additional works (including the new location of the Western Region extraction) will reduce PFAS flux entering the environment by around 30 kg per year
- Investigations at the former and current fire station (Facility 165) and the Eastern Region completed, the findings of which will be used to inform remedial planning in 2026

- The investigations for the permeable barrier trial commenced along the southern edge of Lake Cochran, which will inform future remedial planning in 2026
- The investigations on Dawsons Drain in the Western Region commenced, looking at quantifying the contribution of PFAS from Lake Cochran to Dawsons Drain
- Whilst remediation progress continues across the base, the management of risks to PFAS continues to be undertaken in accordance with the actions outlined in the PMAP.

While PFAS from the central plume continues to discharge into Leary's Drain, the proposed Central Region pump and treat system (scheduled to be installed in late 2026) at Cabbage Tree Road aims to reduce the PFAS mass entering the receiving environment at Fullerton Cove. Similarly, while new maximum and/or increasing concentrations of PFAS have been identified in groundwater in the Western Region, the newly commissioned Western Region pump and treat system aims to minimise the PFAS mass migrating beyond that base boundary.

FIGURE F17: GROUNDWATER ANALYTICAL RESULT DEVIATIONS

Legend

- Active Base Boundary
- Primary Management Zone
- Secondary Management Zone
- Broader Management Zone
- Waterway
- NPWS Reserve
- No Deviations in the Monitoring Period
- First Time Detection of PFAS
- New exceedance of Human Health and/or Ecological Screening Criteria for PFOS, PFHxS, PFOA and/or PFPS
- Significant* new maximum concentration of PFAS

*Significant is considered to be one order of magnitude higher or greater than historical ranges.

*Denotes sampling location with deviation from historical data

Williamtown Management Area Map

The Williamtown Management Area comprises three zones:

- **Primary Management Zone** – this area has significantly higher levels of PFAS and therefore the strongest advice applies.
- **Secondary Management Zone** – this area has some elevated levels of PFAS.
- **Broader Management Zone** – the topography and hydrology of the area means PFAS detections could occur now and into the future.

Each zone has tailored precautionary advice for residents to minimise exposure to PFAS originating from the RAAF Base Williamtown.

The map is based on many sources of information, including:

- The Defence Human Health Risk Assessment monitoring data (released 5 December 2017)
- The location of drainage lines, creeks and other surface water features
- The height of land above sea level
- The location of property boundaries and roads
- Surface water and groundwater flow information based on actual measured data, and modelled data for where contamination may flow in the future.

The map also shows drains leading from the Primary Management Zone (marked as dark blue arrows) and Moors Drain in the Secondary Management Zone (marked with a blue line). The precautionary advice for the area in which the drain is located applies.

Following feedback from the community, the EPA has been working with a group of water experts and the Williamtown Community Reference Group to improve the maps for the various management zones:

- Property boundaries have been overlaid to easily identify individual properties.
- Names of main roads have been included for easy reference
- The three zones within the Management Area are now identified by three shades of blue, representing the concentrations of PFAS detected. This also improves ease of access for visually-impaired people.
- There are now three close-up versions of Fullerton Cove, Williamtown and Salt Ash

1.0 Introduction

1.1 Preamble

AECOM Australia Pty Ltd (AECOM) has prepared this Sampling and Analysis Quality Plan (SAQP) for the implementation of the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) at RAAF Base Williamtown (the 'base') and the surrounding off-base areas, including the Williamtown Management Area (refer to **Figure 1** in **Appendix A**).

The SAQP supports the *PFAS Ongoing Monitoring Plan – November 2023, RAAF Base Williamtown* (Defence, 2023a), here-in referred to as OMP (Defence, 2023a).

The purpose of the OMP (Defence, 2023a) is to collect adequate data to identify and evaluate:

- spatial, and temporal (including seasonal) variability of PFAS in the environment
- changes to sources, transport pathways and/or receptors, described as a conceptual site model for the base and surrounding areas
- whether risks to human and ecological receptors require review
- the influence that risk management activities at the base, as outlined in the PMAP (Defence, 2023b) have had on PFAS in the environment, and
- whether the identified changes trigger an action and/or review

The data will assist in the timely identification of risks and inform Defence's approach to the management of PFAS, including updates and revisions to the PFAS Management Area Plan (PMAP) (Defence, 2023b).

1.2 SAQP Objectives

The objectives of this SAQP are to:

- define the proposed scope of works in detail
- outline the proposed sampling methodology to be adopted
- outline the proposed quality assurance and quality control (QA/QC) measures to be adopted
- define the data collection requirements for the project.

The scope of works (including the proposed schedule, sampling locations and analysis), sampling methodology and other data collection details are outlined in **Section 4.0**.

1.3 Guidelines and Legislation

The SAQP has been developed with reference to the following guidelines and legislation:

- Australian and New Zealand Guidelines, 2018. *Australian and New Zealand Guidelines for Fresh and Marine Water Quality*
- Department of Defence, 2018. *Contamination Management Manual – Annex L Data Management*. August 2018, Amended June 2021
- Department of Health (DoH), 2017. *Health Based Guidance Values for PFAS for use in site investigations in Australia*. April 2017. This document is based on the works undertaken by Food Standards Australia New Zealand (FSANZ) in 2017 (FSANZ 2017)
- Heads of EPAs Australia and New Zealand (HEPA) 2025. *PFAS National Environmental Management Plan 3.0*. January 2025
- National Environment Protection Council (NEPC), 2013. *National Environment Protection (Assessment of Site Contamination) Measure 1999 (as amended 2013)*

DRAFT

- National Health and Medical Research Council (NHMRC), 2019. *Guidance on PFAS in Recreational Water*. August 2019
- NHMRC, 2025. *Australian Drinking Water Guidelines Paper 6 National Water Quality Management Strategy*. October 2011, updated June 2025.
- Standards Australia, 1998. AS/NZ 5667:1998 Water Quality – Sampling. Part 11: Guidance on sampling of groundwaters.

1.4 Background

The previous investigations carried out at the base prior to the implementation of the OMP include the Environmental Site Assessment (ESA) (AECOM, 2017a), the Off-Site Human Health Risk Assessment (HHRA) (AECOM, 2017b) and the Ecological Risk Assessment (ERA) (AECOM, 2018). These reports detailed the nature and extent of PFAS at the base and its associated risks, to both human and ecological receptors from sources of PFAS contamination related to legacy use of AFFF at the base.

The 2019 PMAP (Defence, 2019) was subsequently developed, and supported by the OMP (AECOM, 2019a to 2019c), which was implemented between 2019 and 2023.

In 2023, Defence completed a review of the OMP, which led to the development of an updated OMP (Defence, 2023a) in consultation with the New South Wales Environment Protection Authority (NSW EPA).

To date, the following reports have been prepared under the updated OMP (Defence, 2023a):

- three OMP Sampling Event Reports (AECOM, 2024a, 2024b and 2025b)
- one OMP Ongoing Monitoring Report (AECOM, 2025a)

The PMAP was updated in 2023 (Defence, 2023b), and outlines the risk management actions that Defence has completed, actions currently underway, and actions that may be required in the future to manage PFAS contamination to reduce risks to human health and the environment.

DRAFT

2.0 Site Setting

2.1 Base Description

The base is located at Medowie Road, Williamtown, NSW, approximately 15 km north of the Newcastle NSW central business district (CBD) and is located in the Port Stephens local government area (LGA), as shown in **Figure 1** in **Appendix A**.

The base has been an active Defence base since 1941 and serves as the headquarters to both the Air Combat Group and the Surveillance and Response Group. In 2014, it was designated as the home base for Australia's F-35 Joint Strike Fighters. The southern side of the base is leased to Newcastle Airport Pty Limited, which operates the commercial Newcastle Airport.

The base comprises 'landside' and 'airside' areas:

- landside areas are partially covered by hardstand and pavement consisting of concrete, asphalt roadways, and contain a large number of low-rise buildings, accommodation properties, workshops, aircraft hangars, fuel storage areas and storage facilities
- airside areas consist of taxiways, aprons and the main runway.

2.2 Base and Management Area Settings

The surrounding land uses of the base comprise rural and semi-rural settlements at Fullerton Cove and Salt Ash, small commercial properties and the Salt Ash Primary School. Tilligerry State Conservation area, managed by National Parks and Wildlife Service (NPSW), immediately borders the base to the west, north and east.

Hunter Water Corporation (HWC) pumping stations and groundwater extraction bore fields are located to the west, north and east of the base.

A summary of the environmental setting of the Management Area is as follows:

- The area experiences average low temperatures around 6°C in July and maximum average temperatures of around 28°C in January.
- The highest monthly rainfall generally occurs between January and June (averaging >100 mm per month), with the lowest rainfall in July to December (averaging 74 mm per month).
- Low lying area associated with the Lower Hunter River. The region is characterised by low sand dunes, sand sheets and estuarine mud flats.
- Relatively flat topography with ground elevation ranging approximately 10 metres Australian Height Datum (m AHD) to low lying areas between Fullerton Cove and Tilligerry Creek with elevations between 1 and 3 m AHD.
- The geology of the base and Management Area comprises unconsolidated sands (Tomago Sand Beds and Stockton Sand Beds) underlain by estuarine sediments (Tilligerry Mud Member).
- The base is surrounded by an interconnected network of drains, rivers, estuaries, reservoirs and coastal waterbodies within the catchment areas of both the Hunter River and Port Stephens estuary. The major elements of the regional surface water drainage network include:
 - Dawsons Drain, the Fourteen Foot Drain and the Ten Foot Drain, which are located to the south of the base and drain into Fullerton Cove.
 - Moors Drain and Tilligerry Creek, which are located to the east and south-east of the base and drain to the north east into the Tilligerry Creek arm of Port Stephens.
- The hydrogeology of the area is characterised by two unconfined sand aquifers:
 - Tomago Sand Beds aquifer located northwest of Tilligerry Creek.
 - Stockton Sand Beds aquifer located between Tilligerry Creek and the Newcastle Bight.

DRAFT

In November 2017, the NSW Government released the map of the Williamtown Management Area (refer to **Appendix B**), which comprises three zones that have been defined by the NSW government:

- **Primary Management Zone** – this area has significantly higher levels of PFAS detected and, therefore, the strongest precautionary advice applies
- **Secondary Management Zone** – this area has some detected levels of PFAS
- **Broader Management Zone** – the topography and hydrology of the area means PFAS detections could occur now and into the future.

The NSW government noted that each zone has tailored precautionary advice for residents to minimise exposure to PFAS coming from the base.

2.3 Conceptual Site Model

The Conceptual Site Model (CSM) is presented in the PMAP (Defence, 2023b) which summarises the linkages between sources, exposure pathways and receptors, which was based on the assessments of risk exposure pathways.

The CSM identified key primary PFAS source areas (where AFFF containing PFAS is understood to have been used or disposed of in the past) and secondary PFAS source areas (where PFAS has migrated to a location where it creates a concentration of impact). Additional monitoring and investigation has improved the understanding of these source areas to inform the management requirements. The key sources and pathways are as follows:

- Western Region - characterised by the Former Fire Training Area (FFTA) source that is now remediated¹, and a PFAS groundwater plume extending south away from the source.
- Central Region - characterised by ongoing sources at the Former Fire Training Pad / Current Fire Station (Facility 165) and the Sewage Treatment Plant (Facility 410); with PFAS groundwater plumes extending south across the base boundary.
- Eastern Region - characterised by likely sources at the Trade Waste Treatment Plant (Facility 480) and a Former Fuelling Area, with PFAS groundwater plumes extending east across the base boundary, and PFAS impacted surface water discharges to Moors Drain.

The concentrations of PFAS south of the site and north of Cabbage Tree Rd were likely sourced from Lake Cochran, which was impacted when AFFF foams were still in use at the base. However, Lake Cochran is no longer considered a significant ongoing PFAS source to groundwater. PFAS in the central southern plume discharges into Leary's and Dawsons Drain.

The exposure pathways with elevated PFAS exposure identified by the HHRA (AECOM, 2017b), included:

- drinking groundwater (Management Area)
- incidental ingestion of groundwater from indoor use (Primary Management Zone) and outdoor use (Primary and Secondary Management Zones)
- eating home produced eggs, beef and milk (Management Area)
- eating home grown vegetables (Management Area)
- eating high quantities of locally sourced finfish (Hunter River Estuary, Fullerton Cove and Tilligerry Creek)

Ecological receptors who may be exposed to PFAS via the following:

- toxicity to terrestrial and aquatic organisms from direct exposure to PFAS in soil, sediment or surface water. Applies to drains in Management Area, including Dawsons Drain and Moors Drain

¹ Remedial works intended to substantially reduce PFAS mass in soils have been completed, but residual PFAS contamination remains

DRAFT

- consumption of organisms that have been exposed to PFAS where bioaccumulation is occurring.

DRAFT

3.0 Data Quality Objectives

3.1 Process

The amended National Environmental Protection Measure (NEPM, Schedule B [2]) *Guideline on Site Characterisation* (2013) specifies that the nature and quality of the data produced in an investigation will be determined by the Data Quality Objectives (DQOs). As referenced by the NEPM, the DQO process is detailed in the United States Environmental Protection Agency (US EPA) *Guidance on Systematic Planning Using the Data Quality Objectives Process* (EPA QA/G-4: EPA/240/B-06/001), February 2006.

The US EPA defines the process as ‘a strategic planning approach based on the Scientific Method that is used to prepare for a data collection activity. It provides a systematic procedure for defining the criteria that a data collection design should satisfy, including when to collect samples, where to collect samples, the tolerable level of decision errors for the study, and how many samples to collect’.

The process of establishing appropriate DQOs is defined according to the following seven steps:

Table 1 The seven steps in defining DQOs

Step	Data Quality Objective Step
1	State the problem – Define the problem that necessitates the study; identify the planning team, examine budget, schedule.
2	Identify the goal of the study – State how environmental data will be used in meeting objectives and solving the problem, identify study questions, define alternative outcomes.
3	Identify information inputs – Identify data and information needed to answer study questions.
4	Define the boundaries of the study – Specify the target population and characteristics of interest, define spatial and temporal limits, scale of inference.
5	Develop the analytic approach – Define the parameter of interest, specify the type of inference, and develop the logic for drawing conclusions from findings.
6	Specify performance or acceptance criteria – Develop performance criteria for new data being collected or acceptable criteria for existing data being considered for use.
7	Develop the plan for obtaining data – Select the resource-effective sampling and analysis plan that meets the performance criteria.

The approach adopted relative to the seven steps presented above is discussed in **Table 2** below.

Table 2 Data Quality Objectives

Step	Data Quality Objective Step Summary
1 - State the Problem	Historical use of aqueous film forming foam (AFFF) containing PFAS at the base has resulted in impacts to groundwater, surface water, sediment and biota on- and off-base. The data collected by implementing this SAQP will provide ongoing periodic / longitudinal dataset that can be used to assist with assessment of temporal changes in PFAS concentrations in groundwater and surface water, sediment and aquatic biota on- and/or off-site. In June 2025, the NHMRC revised the drinking water screening criteria for PFOS, PFOA, PFHxS and PFBS, which were up to an order of magnitude lower than the PFAS NEMP (HEPA, 2025) screening criteria for drinking water. Most notably, the revised screening criteria for PFOS (0.008 µg/L) was below the standard laboratory limit of reporting (0.02 µg/L). To delineate the approximate extent of PFAS in groundwater to concentrations below the drinking water guidelines revised by NHMRC in 2025, and to re-assess

DRAFT

Step	Data Quality Objective Step Summary
	the potential risks to off-site users of groundwater and surface water, selected off-site samples will require analysis at a lower laboratory LOR. Additionally, the temporal monitoring of PFAS concentrations in selected biota aims to provide data necessary to support and/or update the ongoing advice relating to minimising exposure (e.g. consumption of seafood).
2 - Identify the Decision/ Goal of the Study	The goal of the study is to establish a systematic routine groundwater, surface water, sediment and biota sampling and analysis program to: - refine current understanding of the distribution of PFAS in groundwater and surface water/sediment associated with the base - monitor changes in PFAS concentrations in selected aquatic biota sentinel species to identify potential changes to the risk profile for consumers - monitor changes to PFAS distribution and variability due to management actions and seasonal variations. This will allow decisions to be made regarding the assessment of risks to human and ecological receptors into the future (for example, updating the conceptual site model), and whether the OMP needs to be amended to reflect these updates.
3 - Identify Information Inputs to the Decisions	The information and inputs needed to support the decisions include: - PFAS results from previous environmental investigations - Meteorological data including rainfall - Previous data collected during the implementation of the 2019 OMP - Data collected during PFAS remediation management activities - Groundwater, surface water, sediment and biota data collected and analysed for PFAS, as part of this OMP (Defence, 2023a) - Advances in laboratory analytical approaches and changes in regulatory requirements.
4 - Define the Boundaries of the Study	The spatial and temporal boundaries that apply for data collection are below: - The spatial boundary for data collection is the base and Management Area - The sampling completed as part of the OMP will be limited to groundwater, surface water, sediment and biota, at the frequencies defined in Section 4.2 - The monitoring will be ongoing.
5 - Develop the Analytical Approach	The analytical approach has been designed to collect environmental monitoring data of sufficient quality and quantify in order to identify potential changes in the known extent of PFAS in the environment, and any potential changes to the conceptual site model and associated risk profile. The decision rules for the study are as follows: - is the study approach scientifically suitable and defensible? <u>Decision Rule:</u> The study approach is considered scientifically suitable and defensible if data are collected in accordance with the applicable guidelines and legislation (outlined in Section 1.3), and the approach outlined in this SAQP. - are the collected datasets adequate to assess changes:

DRAFT

Step	Data Quality Objective Step Summary
	a. in the known nature and extent of PFAS in groundwater, surface water, sediment and biota. b. to the current CSM. c. to the current risk profile for on and off-base human health and ecological receptors. <u>Decision Rule:</u> If the datasets described in Step 3 are collected, that is adequate. During implementation of the SAQP, if it is determined that a Decision Rule finding will not be adequate/ sufficient, AECOM will discuss amending the data collection procedure with Defence.
6 - Specify Performance or Acceptance Criteria	The QA/QC and data validation program is presented in Section 3.2 and Section 4.6.3. Should the performance or acceptance criteria not be met, AECOM will notify Defence and discuss the next steps to achieve the objectives.
7 - Develop the Plan for Optimising the Design for Obtaining Data	The methodology adopted for this investigation has been designed to meet the project objectives and achieve the nominated DQOs. Optimisation of the data collection process will be achieved by: - Assessment of data quality (Section 3.2) - Working closely with the analytical laboratories (and sampling equipment suppliers to ensure that sample handling, transport to and processing by the analytical laboratories is appropriate. - Conducting sampling according to set Standard Operating Procedures (SOPs) and Australian Standards² for the type of sampling being conducted (i.e. groundwater monitoring well sampling versus landholder bore water sampling). - Basing the sampling upon a CSM developed using the information available at the implementation of the OMP (Defence, 2023a). Updating the CSM as new data becomes available in the course of the implementation of the OMP (Defence, 2023a), as required. - Progressive review of the data and modification of sampling programs to optimise the value of data generated. If the objectives of the OMP (Defence, 2023a) are not being met, the sampling design and approach will be reviewed and amended, as required.

3.2 Assessment of Data Quality

The quality of data collected as part of the sampling will be assessed on a range of factors including:

- documentation and data completeness; and
- data quality – comparability, representativeness, precision and accuracy of the analytical data.

The project target for data completeness is to achieve 95% of data as suitable for use. The acceptance criteria for DQIs for samples are specified in **Table 3**.

² Standards Australia (AS/NZS5667.11–1998) Water Quality – Sampling, part 1: Guidance on the design of sampling programs, sampling techniques and the preservation and handling of samples

DRAFT**Table 3 Acceptance Criteria for Data Quality Indicators for Sample Analysis**

Data Quality Indicators (Water and Sediment Samples)	Acceptance Criteria
Field Program	Sampling to be completed by suitably qualified and experienced field teams employing appropriate sampling procedures.
Rinsate Blanks	Rinsate blank samples are to be collected at a rate of one per day of sampling (where sampling equipment is reused). The rinsate blanks would be analysed for PFAS at low level laboratory LOR on days where primary samples collected are scheduled for the same analysis. Concentrations of PFAS should be less than the laboratory LOR.
Field duplicates	Field duplicates as intra-laboratory and inter-laboratory duplicates are to be collected and analysed at a rate of 10% (1 per 10 primary samples) for water matrices and at a rate of 20% (1 in 20 primary samples) for soil matrices. The relative percentage differences (RPD) will be assessed as acceptable if less than or equal to 30% as per the NEPM Schedule B3. Where the results show greater than 30% difference a review of the cause will be conducted (NEPM, 2013). It is noted that RPDs that exceed this range may be considered acceptable where: • results are less than 10 times the LOR (no limit) • results are between 10 and 20 times the LOR and the RPD is less than 50% • heterogeneous materials are encountered.
Laboratory duplicates	The RPD will be assessed as acceptable based on the magnitude of the result: • 0-20% for results more than 20 times the LOR • 0-50% for results between 10 and 20 times the LOR • No limit for results between 0 and 10 times the LOR
Matrix spikes	Recoveries between 70-130% of the theoretical recovery or as nominated in the laboratory's Quality Control report.
Method blanks	Less than the laboratory LOR.
Laboratory control samples	Recoveries between the laboratory-specified range for each particular analyte/analytical suite.

DRAFT

4.0 Scope of Works and Methodology

The OMP (Defence, 2023a) presents an overview of specific monitoring works to be undertaken and provides the basis for the preparation of this SAQP. This scope of works presented in this SAQP is consistent with that detailed in the OMP (Defence, 2023a). Deviations from the OMP are presented in **Section 5.0**.

4.1 Proposed Schedule

The key element of the OMP (Defence, 2023a) is six monthly groundwater, surface water and sediment sampling on- and off-base, and biota sampling biennially (every two years). This includes:

- An autumn comprehensive sampling and analysis event for the first of the biannual groundwater, surface water and sediment sampling events timed to occur in March / April
- A spring targeted sampling and analysis event for the second of the biannual groundwater, surface water and sediment sampling events timed to occur in September / October to target key monitoring wells
- Biota sampling for sentinel species in Fullerton Cove to occur every second year.

The rationale for these elements is summarised below:

- The six-monthly monitoring to occur:
 - o **Autumn** (March / April), during high average rainfall period (128 mm for March and 109 mm for April) based on Bureau of Meteorology (BoM) Williamtown RAAF weather station (number 061078); and
 - o **Spring** (September / October), during low average rainfall period (60 mm for September and 76 mm for October) based on BoM.

It is considered that relatively higher contamination concentrations may occur in groundwater and surface water systems during the high average rainfall periods due to the effects of higher infiltration rates through the unsaturated zone which may mobilise contaminants.

- The monitoring event targeting low average rainfall period will increase the understanding of changes in PFAS concentrations in groundwater at discrete locations, considered to be of importance for understanding trends (for example bores close to source areas, base boundaries and creek systems), or locations with higher sensitivity (groundwater sample locations with concentrations close to screening criteria, areas with fewer monitoring locations).

In addition to the routine OMP sampling, a number of additional groundwater sampling locations have been selected for Ad Hoc sampling purposes during the October 2025 sampling event. These locations will subsequently be reviewed for potential inclusion in the OMP (refer to **Table 16**).

The schedule of fieldworks under the OMP (current and previous) is presented in **Table 4** below.

Table 4 Fieldwork Schedule

Sampling Round No.	Description of works	Proposed Schedule
1	Biannual groundwater, surface water, sediment and soil sampling	November 2019 (Completed)
2	Biota sampling	January 2020 (Completed)
3	Annual groundwater, surface water, sediment and soil sampling	May 2020 (Completed)
4	Flood water sampling	July 2020 (Completed)

DRAFT

Sampling Round No.	Description of works	Proposed Schedule
5	Biannual groundwater, surface water, sediment and soil sampling, surface water max flux baseline sampling	November 2020 (Completed)
6	Surface water mass flux event	December 2020 (Completed)
7	Surface water mass flux event	January 2021 (Completed)
8	Biota sampling	February 2021 (Completed)
9	Annual groundwater, surface water, sediment and soil sampling	May 2021 (Completed)
10	Biannual groundwater, surface water, sediment and soil sampling	November 2021 (Completed)
11	Biota sampling	February 2022 (Completed)
12	Annual groundwater, surface water, sediment and soil sampling	May 2022 (Completed)
13	Biannual groundwater, surface water, sediment and soil sampling	November 2022 (Completed)
14	Annual groundwater, surface water, sediment and soil sampling	May 2023 (Completed)
15	Biannual groundwater, surface water and sediment sampling	November 2023 (Completed)
16	Biota sampling	January to April 2024 (Completed)
17	Annual groundwater, surface water and sediment sampling	April 2024 (Completed)
18	Biannual groundwater, surface water and sediment sampling	September 2024 (Completed)
19	Annual groundwater, surface water and sediment sampling. Additional Ad Hoc groundwater locations.	April 2025 (Completed)
20	Biannual groundwater, surface water, sediment and soil sampling. Additional Ad Hoc groundwater locations	October 2025
21	Biota sampling	February 2026
22	Annual groundwater, surface water, sediment and soil sampling	April 2026
23	Biannual groundwater, surface water and sediment sampling	October 2026
24	Annual groundwater, surface water, sediment and soil sampling	April 2027

DRAFT

Sampling Round No.	Description of works	Proposed Schedule
25	Biannual groundwater, surface water and sediment sampling	October 2027

4.2 Sampling Locations**4.2.1 Groundwater Sample Location Rationale**

Groundwater monitoring will be undertaken on selected monitoring wells, Hunter Water bores and residential bores. The OMP (Defence, 2023a) will monitor water quality in the shallow and deep portions of the Tomago Sandbeds aquifer. The current understanding of the CSM is that PFAS concentrations in the intermediate groundwater (approximate depth of 12 m bgs) are similar to that of the deeper portions (approximate depth of 20 m bgs) of the aquifer, and hence will not be targeted.

The rationale for monitoring well selection for each area is summarised in **Table 5** below.

Table 5 Groundwater Sample Location Rationale

Area	Rationale
On-base	• Monitor spatial and temporal variations in PFAS concentrations in groundwater concentrations up, down and cross-gradient of source areas • Monitoring of PFAS concentrations in groundwater within and downgradient of the source areas to assess change in response to management measures over time • Monitoring of HWC assets that are in close proximity to the PFAS plume to inform risk to a potential drinking water supply • Monitoring of sentinel wells for Pump Station 7 located on-base • Monitoring of PFAS concentrations in groundwater within the on-base Moors Drain Catchment, targeting elevated PFAS concentrations detected during recent PFAS characterisation studies. • Continue to monitor groundwater wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitoring of groundwater on transects parallel and perpendicular to plume, and at shallow and deep portions of the aquifer to assist with understanding concentration changes in the nominated transect alignments.

DRAFT

Area	Rationale
East of base	• Monitor spatial and temporal variation in PFAS concentration in groundwater up and down hydraulic gradient of HWC asset Pumping Station 9 • Continue to monitor groundwater wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitor potential changes in PFAS concentrations at the plume margins to refine model predictions and provide an indication of additional management of PFAS to groundwater users outside the current plume • Monitor groundwater adjacent to Moors Drain to assess PFAS migrating from the drain to groundwater • Monitor groundwater on transects parallel and perpendicular to the plume, and at shallow and deep portions of the aquifer to assist with understanding concentration changes in the nominated transect alignments.
West of base	• Monitor the western edge of the plume in relation to HWC asset Pumping Station 5 at sentinel locations • Monitor the movement of PFAS from the former Fire Training Area (FFTA) towards southern boundary (within the Demolition of Explosive Munitions Site (DEMS) Area) • Monitor groundwater wells on transects parallel and perpendicular to plume, and at shallow and deep portions of the aquifer to assist with understanding concentrations changes in the nominated transect alignments.
Southern Area	• Monitor potential changes in PFAS concentrations at the plume margins in the Southern Area (Primary Management Zone) to refine model predictions • Continue to monitor groundwater wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitor groundwater on transects parallel and perpendicular to plume, and at shallow and deep portions of the aquifer to assist with understanding concentrations changes in the nominated transect alignments.
Cabbage Tree Road	• Monitor potential changes in PFAS concentrations to refine model predictions and provide an indication of additional management of PFAS to groundwater users outside the current plume • Continue to monitor the isolated detections of PFAS in groundwater that have been considered to be associated with unconfirmed mechanisms. This may include transport of PFAS via surface water, flooding or an unidentified source • Continue to monitor wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitor groundwater on transects parallel and perpendicular to plume, and at shallow and deep portions of the aquifer to assist with understanding concentrations changes in the nominated transect alignments.

DRAFT

Area	Rationale
Lavis Lane	• Monitor the plume to the south east of the base and in the Lavis Lane area • Monitor groundwater adjacent to Fourteen Foot Drain • Monitor potential changes in PFAS concentrations at the plume margins to refine model predictions and provide an indication of additional management of PFAS to groundwater users outside the current plume • Continue to monitor wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitor groundwater on transects parallel and perpendicular to plume, and at shallow and deep portions of the aquifer to assist with understanding concentrations changes in the nominated transect alignments.
Salt Ash	• Monitor the isolated detections of PFAS in groundwater in Salt Ash that have been considered to be associated with unconfirmed mechanisms. This may include transport of PFAS via surface water, flooding or an unidentified source • Monitor potential changes in PFAS concentrations at the plume margins to refine model predictions and provide an indication of additional management of PFAS to groundwater users outside the current plume • Continue to monitor wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations • Monitor groundwater on transects perpendicular to the plume, and at shallow and deep portions of the aquifer to assist with understanding concentrations changes in the nominated transect alignments.
Fullerton Cove	• Monitor the isolated detections of PFAS in groundwater that have been considered to be associated with unconfirmed mechanisms. This may include transport of PFAS via surface water, flooding or an unidentified source • Monitor potential changes in PFAS concentrations to refine model predictions • Continue to monitor wells with existing temporal datasets to assist with better understanding of temporal patterns in PFAS concentrations.

4.2.2 Groundwater Sampling Locations

The groundwater locations to be monitored on a biannual (six-monthly) and/or annual basis, as well as those to be sampled on an Ad Hoc basis (to be later reviewed) are provided in **Table 6** below and are presented on **Figures 1 to 4** in **Appendix A**.

Up to 75 groundwater locations will be analysed for PFAS at low level laboratory LOR as specified in **Table 6**. The analysis of selected groundwater samples at the lower level will allow comparison to the NHMRC (2025) PFAS drinking water values (also refer to Table 16).

DRAFT**4.2.3 Surface Water Sampling Locations**

The surface water monitoring locations have been selected to maintain consistency with the monitoring completed during the implementation of the 2019 OMP (AECOM, 2019), and address the requirements of the NSW Government and provide additional data to assess temporal variability. Four additional locations (SW333, SW582, SW588, SW600) were added within Dawsons Drain, Moors Drain and Fourteen Foot Drain.

The locations to be monitored on a biannual (six monthly) basis are provided in **Table 7** below and are presented on **Figures 1 to 4** in **Appendix A**. All surface water locations will be analysed for PFAS at the standard LOR.

DRAFT

4.2.4 Sediment Sampling Locations

Sediment sampling will be undertaken at the locations where surface water samples are collected as defined in **Section 4.2.3**. The sediment sampling locations have been selected to maintain consistency with the monitoring completed during the implementation of the 2019 OMP (AECOM, 2019a) and address the requirements of the NSW Government and provide additional data to assess temporal variability. Two additional locations (SD333, SD600) were added within Dawsons Drain and Fourteen Foot Drain.

The locations to be monitored on a biannual (six-monthly) basis are provided in **Table 8** below and are presented on **Figures 1 to 4** in **Appendix A**. All sediment locations will be analysed for PFAS at the standard LOR.

DRAFT

Note: Historical Name, Eastings and Northings are sourced from the Defence Esdat database. Some coordinates are not displayed for privacy reasons.

4.2.5 Biota Sampling Locations

Sampling will continue to target sentinel species in Fullerton Cove (refer to **Figure 1** in **Appendix A**) as per the previous OMP (AECOM, 2019) that were identified to accumulate elevated concentrations of PFAS relative to other species, namely:

- Dusky Flathead (*Platycephalus fuscus*)
- Luderick (*Girella tricuspidata*)
- School Prawn (*Metapenaeus macleayi*).

A description of these species is provided in **Table 9** below.

Table 9 Aquatic Biota Description

Species	Description
Finfish	
Dusky Flathead (<i>Platycephalus fuscus</i>)	• Dusky Flathead PFAS levels in the Hunter River were considered to be elevated relative to other species, variable and did not follow spatial patterns evident in the other species • Dusky Flathead is a target recreational and commercial species.
Luderick (<i>Girella tricuspidata</i>)	• Found primarily in estuaries and around nearshore rocky reefs • Spawning occurs in surf zones near estuary entrances during winter, the larvae then enter estuaries and small juveniles live in sheltered shallow water habitats. Adults are mainly found in association with weedy habitats such as seagrass and rocky reefs. Adults migrate to near-coastal waters prior to spawning and may then return to estuaries • Mainly herbivorous, feeding on seagrass and green algae, and sometimes small invertebrates • Mature around 25 cm. Minimum legal length is 27 cm • Important recreational species, minor commercial species.
Crustacea	
School Prawn (<i>Metapenaeus macleayi</i>)	• Inhabit estuaries and inshore ocean waters • Spawn in near shore ocean waters between December and May. Post-larval prawns enter estuaries and move upstream. Following spring the adolescent prawns return down-stream and migrate to sea to mature and spawn • Prefer soft, muddy substrates and areas of seagrass • Eat a variety of small invertebrates and detritus • Maximum length 16 cm • Important domestic market.

It is noted that not all species above may be present at Fullerton Cove during the sampling event.

The aquatic biota monitoring locations are to be monitored on a biennial (every second year) basis. A summary of the sample numbers is provided in the **Table 10**. All biota samples will be analysed for PFAS at the standard LOR.

Table 10 Summary of sample numbers

Species	Number of Composite Samples per Event	Total No. of Individual Samples for each Composite
Dusky Flat Head	4	Up to 10
Luderick	4	Up to 10
School Prawn	4	Up to 10

DRAFT**4.3 Sample Collection and Handling****4.3.1 Sampling Methodology**

The sampling methodology is presented in **Table 11**.

Table 11 Groundwater Sampling Methodology and Schedule

Item	Details
Groundwater gauging	The depth to groundwater will be measured in each monitoring well prior to collection of groundwater samples. Additionally, during each sampling event a gauging round of selected groundwater locations will be conducted to enable groundwater contours to be developed. The selected locations for the targeted gauging event are as follows: • shallow wells: MW106S, MW122, MW123, MW124, MW125S, MW126S, MW146S, MW162S, MW188S, MW232S, MW247S, MW256S, MW257S, MW260S, MW268S and MW897S • deep monitoring wells: MW106D, MW125D, MW126D, MW146AD, MW162D, MW188D, MW232D, MW247D, MW256D, MW257D, MW260D, MW268D and MW897D.
Groundwater Sample Collection Methodology	Groundwater Monitoring Wells Groundwater samples will be collected from monitoring wells using no-purge methodology with HydraSleeves™ which will be installed within the screened interval of the wells. Care should be taken to avoid placing the base of the HydraSleeves™ at the base of the monitoring well, where a build-up of sediment may be present. The installation depth of the HydraSleeves™ is to be recorded (generally as HydraSleeve™ collar depth in metres below top of casing (mbTOC)). HydraSleeves™ are to be installed / deployed in monitoring wells for a minimum of 4 hours prior to sampling, when deployed with bottom weights only, and for a minimum of 24 hours prior to sampling, when deployed with both top and bottom weights, to allow re-stabilisation of the well following disturbance, and if applicable, for the top weight to compress. Following sampling, water quality parameters are recorded ex-situ, from any excess water available in the HydraSleeve™. In the event that a HydraSleeve™ fails to deploy or has been removed inadvertently (i.e. by a non-OMP project), the sample will be collected using a dedicated disposable high-density polyethylene (HDPE) bailer, if time or access constraints do not permit re-deployment of the HydraSleeve™ and subsequent sampling in the same sampling event. When sampling with a bailer, a minimum of three well volumes should be purged and purging should be continued until stabilisation of water quality parameters (to be collected continuously ex-situ) is achieved. If recharge is insufficient during purging, care will be taken to avoid purging the well dry and collecting the sample when reasonable to do so. Once sampling is completed, a new HydraSleeve™ will be deployed at the screened interval depth at each location in preparation for the next scheduled sampling round, where practicable. HydraSleeve™ sampling will be completed in accordance with the manufacturer's guidance. Due to narrow PVC of monitoring wells MW842 and MW844, groundwater samples will be collected using a peristaltic pump. MW829 is a non-traditional well with no well cap or gatic (pump station bore/sampling point) and will be sampled using a bailer.

DRAFT

Groundwater Sample Collection Methodology	Residential Bores Bore water samples will be collected by placing the laboratory provided sample bottle beneath the tap outlet and the tap slowly opened to collect the “first flush” of water. Following sampling, water quality parameters will be recorded ex-situ, by placing the water quality meter (WQM) probe in a cup filled with bore water from the tap outlet.
Surface Water Sample Collection Methodology	Surface water samples will be collected in accordance with the ASC NEPM (NEPC, 2013) and PFAS NEMP (HEPA, 2025). Samples will be collected from either mid-way through the water column or approximately 0.5 m below the surface (if possible) using a ‘grab’ sample method, without disturbing the bottom of the surface water body and without capturing any surface film, to minimise collection of sediment, or floating materials in the samples. At each location, a new, laboratory supplied container should be lowered into the water with the cap immediately applied once the container is full. Where sampling points cannot be accessed safely, surface water samples will be collected with use of a sampling pole. Description of each sampling location will be recorded (including physical setting, flow observations, presence of sheen or foam etc).
Sediment Sample Collection Methodology	Sediment samples will be collected in accordance with the ASC NEPM (NEPC, 2013) and PFAS NEMP (HEPA, 2025). Sediment samples are to be collected from a depth representative of potentially deposited sediments and collected from within the water body, if possible. Where embankment stability and surface water depth permits, sediment samples will be collected using a hand trowel to a maximum depth of 0.3 m below the sediment surface. Where access to sediment is restricted by bank instability or the presence of surface water, samples will be collected using a hand auger or Dormer Piston Sediment Sampler. A new laboratory supplied container will be used at each location for collection of samples, and any reusable sampling equipment utilised will be de-contaminated between locations. Description of each sampling location and the sample material will be recorded.
Biota Sample Collection Methodology	Samples will be captured utilising the following process, similar to the previous methodology adopted during the 2019 OMP, and undertaken in accordance with the appropriate permits and ethics approval (refer to Appendix C). Four composite samples shall be collected per event, per target species. Each composite sample will comprise of up to 10 individual specimens and will be prepared at the laboratory under the laboratory’s supervision. In addition to the composite samples, one fillet from each fish will be retained and frozen for future analysis should information on individual variation (or linking of PFAS concentrations to biological attributes such as growth, sex etc.) be required at a later date. A detailed methodology for the collection of biota samples is presented in the Standard Operating Procedure for Aquatic Biota Sampling (Appendix C).
QA/QC Samples to be Collected	For water and sediment matrices, field QA/QC samples are to include intra-laboratory duplicate and inter-laboratory duplicate samples), as well as rinsate blank samples, as specified in Section 4.11. AECOM will collect extra sample volume to enable the laboratory to complete their internal QA/QC analysis.

DRAFT

	AECOM personnel will attempt to reduce potential heterogeneity in the sample media matrix by dividing the sample collected between primary and intra-laboratory jars or bottles during sampling. For biota matrices, no duplicate sampling is proposed as the samples are being composited. Individual specimens of the composite samples will be retained to validate composite results as required.
Field Parameters	Temperature, electrical conductivity (EC), dissolved oxygen (DO), Redox (reduction-oxidation), pH and observations of water quality will be recorded for all groundwater and surface water samples, including: - physical indicators such as the presence (and approximate proportion) of suspended solids, colour - the presence/absence and nature of odours and the presence/absence of slicks or sheens on water.
Sample Analysis	Primary samples will be submitted for PFAS analytical full suite (30 analytes) using the standard levels of detection (i.e. standard LOR), with the exception of up to 75 groundwater monitoring locations, specified in Table 6, to be submitted for PFAS analytical full suite (30 analytes) using low level detection (i.e. low level laboratory LOR). For biota matrices, all composites will be prepared at the laboratory under the laboratory's supervision and will be tested for PFAS analytical full suite (30 analytes) using the standard levels of detection (i.e. standard LOR). Biota sample preparation by the laboratory includes removal of scales/shell, head and internal organs. Fillets will be taken with skin intact and homogenised prior to sub-sampling and analysis.

4.3.2 Decontamination of sampling equipment

To avoid cross-contamination between samples and sample locations, all reusable sampling equipment, such as interface probe and trowel, will be de-contaminated between locations. The proposed method of decontamination is summarised below:

- preliminary wash and scrub with tap water, after each sampling location
- wash using Liquinox®
- rinsed with tap water
- rinsed with deionised water (supplied by the laboratory).

Clean, disposable nitrile gloves will be worn and replaced between each sample.

4.3.3 Sample Handling and Transport to Laboratory

All samples will be placed on ice in eskies immediately after sampling. All water and moist sediment samples should be kept, where possible, at low temperatures ($\leq 6^{\circ}\text{C}$) during transit to the laboratory, in accordance with ASC NEPM (NEPC, 2013).

Samples will be transported directly to the laboratory for analytical testing under standard chain of custody (CoC) procedures. Primary and associated duplicate QA/QC samples will be analysed by Australian Laboratory Services (ALS). The inter-laboratory duplicate samples will be analysed by Envirolab Services (Envirolab). For biota matrices, samples will be analysed by the National Measurement Institute (NMI).

4.4 Calibration

The calibration of the water quality meter (WQM) will be tested each day via a "bump test" prior to the commencement of field activities with relevant solutions, including pH, EC and Redox. The calibration will be in accordance with manufacturers' instructions or National Association of Testing Authorities

DRAFT

(NATA) publication “General Requirements for Registration: Supplementary Requirement: Chemical Testing (NATA 1993) and Technical Note N0. 19 (NATA 1994)”. Where satisfactory calibration cannot be achieved, the water quality data will not be used for interpretive purposes.

Calibration details will be recorded on field sheets and included in the Sampling Event Factual Reports for each sampling round.

4.5 Logistics

The laboratory sample containers will be shipped from the laboratory to the AECOM office in Sydney or Newcastle prior to the commencement of fieldwork. All samples will be transported by field staff or couriered directly to the relevant laboratory, at the completion of fieldwork. All inter-laboratory duplicate samples will be submitted under a separate CoC for analysis.

4.6 Analytical Suite and Laboratory Analysis Methods

4.6.1 Laboratory NATA Accreditation Details

The laboratory is required to use NATA accredited methods based on NEPM, US EPA, Table B 15 of the US Department of Defence/Department of Energy and American Society for Testing and Materials (ASTM) methods as appropriate.

The primary and secondary laboratories selected for this program are ALS (NATA Accreditation Number 825), NMI (NATA Accreditation Number 198), and Envirolab (NATA Accreditation Number 2901).

4.6.2 Analytical Schedule

All media sampled will be analysed for the 28-analyte PFAS suite (presented in **Appendix D**).

The current standard and low level laboratory LOR for the primary laboratories are described in **Table 12** below.

Table 12 Laboratory Limits of Reporting

Sample Media	Parameter	Technique/Method Reference	LOR
Water	PFAS Full Suite	LCMS	Low Level 0.002 – 0.01 µg/L
Water	PFAS Full Suite	LCMS	Standard 0.01 – 0.1 µg/L
Sediment	PFAS Full Suite	LCMS	Standard 0.0002 – 0.001 mg/kg
Biota	PFAS Full Suite	AUTLO7 (USEPA537/821)	Standard 0.0003 – 0.001 mg/kg

LCMS = Liquid chromatography mass spectrometry

4.6.3 Validation of Analytical Results

Validation of analytical results may be required in the form of re-analysis by the reporting laboratory or through re-sampling and analysis, to confirm original results.

The requirement for re-sampling and/or re-analysis will be determined in consultation with Defence and will generally apply to results that are first-time detections of PFAS in water matrices, new exceedances of human health guidelines or consecutive increases of PFAS concentrations in sediments.

4.7 Sample Nomenclature

In order to meet Defence data management requirements, a consistent sample nomenclature has been adopted for the Program. All primary samples will be labelled using the following naming convention:

PPPP_XX000_ZZZ_YYMMDD

[property ID]_[type of sample][THREE DIGIT sample number]_[top of sample depth]_[yearmonthday]

DRAFT

e.g. 0908_MW001_240515

Location types and codes are prescribed by the Defence Contamination Management Manual, Annex L Data Management (Defence, June 2021) and the Site's investigation history.

Location types relevant to this SAQP include:

- MW = monitoring well
- SW = surface water
- SD = sediment
- BIOAFA = biota aquatic fauna (school prawn, dusky flathead, luderick).

QA/QC Samples will be labelled in accordance with the following convention:

- duplicate (intra-laboratory duplicate): PPPP_QC1XX_YYMMDD
- triplicate (inter-laboratory duplicate): PPPP_QC2XX_YYMMDD
- rinsate blank: PPPP_QC3XX_YYMMDD.

4.8 Defence ESdat Requirements

Defence has contracted Earth Science Information Systems (EScIS), to provide contamination data management services through a cloud instance of its Esdat product.

All field and laboratory data collected by AECOM will be uploaded, stored and managed in Defence's Environmental Data Management System (EDMS (Esdat)) in accordance with Section 6 of Annex L to the Defence Contamination Management Manual. AECOM will refer to historical investigation data to ensure consistent location codes are used to enable analysis of data trends. Where required under Annex L, non-compliant location codes will be resolved under direction from Defence.

AECOM will ensure that electronic data deliverables (EDDs) from the laboratory include required information for automatic upload into the EDMS, such as including the correct Project ID in Esdat files and including the Esdat auto-upload email address (DERP.LabReports@esdat.com.au - for the Defence database; esdat+audef@esdatlabsync.net – for Defence AECOM database) in the laboratory report recipient list.

4.9 Adopted Screening Criteria

Adopted screening criteria references national guidance in the form of the PFAS National Environmental Management Plan, Defence estate and environmental strategies, and Defence PFAS-specific strategies and guidance.

At the time of preparing this SAQP, a number of relevant guidance documents were in circulation in Australia including:

- PFAS National Environmental Management Plan (NEMP) Version 3.0, Heads of EPA (HEPA) Australia and New Zealand. March 2025 (HEPA, 2025)
- Department of Health (DoH), 2017. Health Based Guidance Values for PFAS for use in site investigations in Australia. April 2017 (FSANZ, 2017)
- National Health and Medical Research Council (NHMRC), 2019. Guidance on PFAS in Recreational Water. August 2019 (NHMRC, 2019)
- NHMRC, 2025. *Australian Drinking Water Guidelines Paper 6 National Water Quality Management Strategy*.

The screening criteria adopted to assess the data generated as part of this SAQP are presented in **Table 13** and **Table 14** below, for human and ecological receptors, respectively. Note that the HEPA NEMP 3.0 (2025) does not provide screening criteria for PFAS in sediments.

DRAFT**Table 13 PFAS Adopted Screening Criteria – Human Receptors**

Media	Pathway	Compound	Criteria	Comment/Reference
Water – Groundwater	Drinking water	PFOS	0.008 µg/L	In June 2025, the NHMRC (2025) published revised drinking water criteria guidelines for PFOS, PFHxS, PFOA and PFBS. <i>All groundwater results will be compared to these criteria.</i>
		PFHxS	0.03 µg/L	
		PFOA	0.2 µg/L	
		PFBS	1 µg/L	
Water – Surface Water and Groundwater	Recreational use	PFOS + PFHxS	2 µg/L	The values presented in the PFAS NEMP (HEPA, 2025) are based on the NHMRC (2019) values. Note: given that groundwater at the base is extracted for irrigation purposes (post treatment), the recreational guidelines have been adopted to be protective of this water use activity. Note: groundwater at the base will also be screened against the drinking water guidelines as specified above. <i>All surface water and groundwater results will be compared to these criteria.</i>

Table 14 PFAS Adopted Screening Criteria - Ecological Receptors

Media	Pathway	Compound	Criteria	Comment/Reference
Water – Groundwater and Surface Water	Freshwater	PFOS	0.00023 µg/L	The values are from the PFAS NEMP (HEPA, 2025) which endorsed the Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2023) . The 99% species protection level has been applied for high value conservation systems. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife. It is proposed that the laboratory LOR is adopted for the purposes of preliminary screening of analytical water results, rather than sole use of the criteria value. <i>All surface water and groundwater results will be compared to these criteria.</i>
		PFOA	19 µg/L	

The adopted screening criteria for aquatic biota sampling are sourced from the Food Standards Australia New Zealand (FSANZ) *Perfluorinated chemicals in food* (FSANZ, 2017) and are summarised in **Table 15** below.

Table 15 PFAS Screening Criteria - Aquatic Biota

Compound	Criteria	Comment
FSANZ 2017 2-6 years Crustaceans (all species)		
PFOS	0.065 mg/kg	All school prawn sample results will be compared against these criteria
PFHxS	0.065 mg/kg	
PFOA	0.520 mg/kg	
FSANZ 2017 2-6 years Finfish (all species)		
PFOS	0.0052 mg/kg	

DRAFT

Compound	Criteria	Comment
FSANZ 2017 2-6 years Crustaceans (all species)		
PFHxS	0.0052 mg/kg	<i>All luderick and dusky flathead sample results will be compared against these criteria</i>
PFOA	0.0410 mg/kg	

4.10 Waste Management

Due to the proposed “no purge” sampling methodology adopted for the majority of the groundwater monitoring locations and the grab samples from the designated surface water sampling locations, it is not anticipated that significant volumes of liquid waste would be generated that would require on-Site management and disposal.

All consumables (i.e. HydraSleeves™, general rubbish) will be bagged and placed in on-Site general waste bins for disposal.

4.11 Field Quality Assurance/Quality Control Sampling**4.11.1 Intra-laboratory and Inter-laboratory Duplicate Samples**

Intra-laboratory duplicate samples (blind duplicates) and inter-laboratory duplicate samples (blind triplicates) will be collected and analysed at a minimum frequency of 1 in 10 primary samples for water matrices and at a minimum frequency of 1 in 20 for soil matrices, in accordance with the QA/QC guidance outlined in HEPA (2025).

4.11.2 Rinsate Samples

Rinsate blank samples will be collected and analysed at a minimum frequency of 1 per day of fieldworks, in accordance with guidance outlined in the HEPA (2025).

Rinsate blanks will be collected by pouring laboratory supplied deionised water over decontaminated gauging and sampling equipment that will be re-used (e.g. interface probe, trowel).

4.12 Fieldwork Documentation**4.12.1 Field Notes**

Field notes will be maintained to record all field sampling events and include observations made at each sample location. Field notes will include general site setting, location information, and information specific to the sample media, as follows:

- weather conditions, and visual or olfactory conditions at the location
- location coordinates and means of access, and any changes from previous access to a specific location
- groundwater samples – the observed characteristics of the sample (e.g. colour, turbidity, presence/absence and nature of odours, presence/absence of slicks or sheens) and measured field water quality parameters (pH, EC, DO, ORP, temperature) will be recorded. Condition of monitoring wells and gauging details will also be recorded
- surface water samples – the observed characteristics of the sample (e.g. colour, turbidity, presence/absence and nature of odours, presence/absence of slicks or sheens) and field water quality parameters (pH, EC, DO, ORP, temperature) will be recorded. Additionally, a description of each surface water sampling location will be recorded, such as indicating the waterbody type (lake, stream, etc.), presence/absence of water flow, and waterbody width
- sediment samples – the observed characteristics of the sample (e.g. colour, sediment type, moisture, presence/absence and odours) and the depth will be recorded
- the quality control (e.g. intra-laboratory duplicate and inter-laboratory duplicate) sample details be recorded.

DRAFT

The ESdat Field Portal will be utilised by field staff to capture consistent field data based on project specific requirements, minimise potential data transcription errors and facilitate efficient data review.

4.12.2 Sample Labels

Sample containers will be labelled, as a minimum, with the following information:

- AECOM project number
- name of sampler
- sample ID
- date of sample collection.

An indelible felt pen will be used for labelling, to ensure that the lettering is not erased during transit to the laboratory. Sample containers that are sent to the primary laboratory, ALS, will also be scanned into the laboratory's custom-built mobile app (by scanning the barcode applied to each laboratory-supplied container) for streamlined labelling and Chain of Custody (CoC) creation and to ensure compliant sample IDs are used in the field.

4.12.3 Chain of Custody Forms

A CoC form will be completed, documenting the sample identification number and analytes. The CoC documents the chain of events from sample collection to delivery at the laboratory and provides a traceable account of sample handling. The CoC form will be signed by both the sample collector and the receiving laboratory.

The CoC form will include the following information:

- job number
- date and time of sample collection
- sample ID
- type of containers
- name of sampler
- laboratory to be used
- analyses required
- any comments
- signatures of the sampler and laboratory receiver.

In the event that additional samples are collected during the field investigations due to observations made by the Field Team, (i.e. samples not proposed in this SAQP), Defence will be provided the rationale for collection of those samples and proposed laboratory analyses. Defence approval will be sought to include these samples on the CoC and to dispatch these samples to the laboratory.

Upon receipt of the original documents accompanying the samples at the laboratory, the laboratory will provide a sample receipt document (noting the temperature of samples upon receipt, analyses required and any non-conformances) and return the signed CoC form and sample receipt notification (SRN) to confirm analyses to be performed and the due date for the analytical results.

4.13 Reporting

4.13.1 Sampling Event Factual Report

AECOM will prepare and submit a Sampling Event Factual Report to Defence following the completion of each sampling event. The Sampling Event Factual Report will include:

- details of the scope completed
- a description of the sampling methodologies used

DRAFT

- identification of any components of the scope that could not be completed
- a summary of field observations (e.g. any visual or olfactory observations that may indicate impacts to surface water or groundwater) and water quality parameter measurements
- evaluation of the applicability of adopted assessment levels
- a presentation of the analysis results in a table that includes comparisons with PFAS guidelines
- a presentation of groundwater levels for the event on a figure with inferred contours and inferred groundwater flow direction
- review of the suitability of the data for assessment purposes (QA/QC evaluation)
- inclusion of the following information as attachments:
 - field data including field water quality parameter and gauging measurements
 - chain of custody forms
 - laboratory analytical certificates
 - equipment calibration certificates.

The Sampling Event Factual Report will be provided to Defence no later than four weeks after completion of the field component. AECOM will inform Defence in the case of delays in laboratory results.

4.13.2 Ongoing Monitoring Report

At the end of each 12-month monitoring period, AECOM will prepare and submit an Ongoing Monitoring Report (OMR) to Defence. The OMR will include:

- evidence of compliance with the requirements of the SAQP and meeting stated objectives of the OMP (Defence, 2023a)
- identification of any components of the scope that could not be completed
- a summary of any changes to the monitoring network condition that may affect data integrity, or require rectification works, and recommendations for repair, replacement or decommissioning of a location
- relevant figures depicting sampling locations and site-specific hydrogeological features
- laboratory results and analysis including comparison with relevant screening criteria
- assessment and commentary on appropriate QA/QC procedures
- data interpretation, including trends in groundwater concentration, gradient and flow directions
- assessment of statistically based trends (as described in Step 3 and 5 of the DQOs) that may inform decision making when it comes to the revision of the OMP (Defence, 2023a) including whether a review of the Conceptual Site Model is required or whether the risk profile has changed overall, or for any specific location at the base, and a recommendation as to whether this should trigger an OMP and/or PMAP review, or other action.
- inclusion of the following information as attachments:
 - field data including field water quality parameter and gauging measurements
 - CoC forms
 - laboratory analytical certificates
 - equipment calibration certificates.

DRAFT

5.0 Deviations from OMP

While the scope of works and methodology described in this SAQP are consistent with that presented in the OMP (AECOM, 2023a), a point of deviation is noted (refer to **Table 16** below).

Table 16 Deviations from OMP

No.	Description	Rationale
1	Addition of private property sampling locations MW139, POT046, POT085, POT107, POT144 and POT236	Following the removal of the sampling locations from the OMP (2019a), private property owners requested for the locations to continue to be sampled as part of the OMP (2023a).
2	Change of the PFAS standard analytical suite LOR for up to 70 off-base groundwater sampling locations as specified in Table 6	Sampling locations, where historical PFOS concentrations were consistently reported below or close to LOR, were selected to be analysed for PFAS at low level laboratory LOR, to allow for assessment against the draft Australian Drinking Water Guidelines. Of the current OMP groundwater sampling location, 56 were selected for low level LOR analysis. An additional four groundwater sampling location have also been selected for low level LOR analysis, to be sampled on Ad Hoc basis (see deviation #3 below). The change in level of detection will be applicable to the April 2025 event and will be reviewed for potential inclusion in the following event in October 2025.
3	Addition of groundwater sampling locations to be sampled on Ad Hoc basis as specified in Table 6	Four groundwater sampling locations (MW137, MW165, MW266D and MW266S) have been selected from within the BMZ boundaries for low level LOR analysis in addition to the existing OMP locations (as discussed above). An additional 10 groundwater sampling locations (MW142D, MW142S, MW144, MW262D, MW262S, MW536, MW537, MW538, POT303, POT365) have been selected as contingency locations for low level LOR analysis, based on the PFAS results from nearby locations.
4	Drinking water criteria	The OMP (Defence, 2023a) specifies that results from groundwater locations be screened against the human health screening criteria for drinking water of 0.07 µg/L for PFOS+PFHxS and 0.56 µg/L for PFOA. In June 2025, the NHMRC (2025) published revised drinking water criteria guidelines for PFOS (0.008 µg/L), PFHxS (0.03 µg/L), PFOA (0.2 µg/L) and PFBS (1 µg/L). Therefore, groundwater results will be screened against these new drinking water screening criteria.
5	Replacement of monitoring wells MW104D, MW104S, MW184D and MW184S	During the April 2025 sampling event, monitoring wells MW104D, MW104S, MW184D and MW184S could not be located and are assumed to have been destroyed by redevelopment works in this area. To address the gap in monitoring coverage, AECOM has included existing wells MW185, MW177 and MW220S to replace the wells above.

DRAFT

No.	Description	Rationale
6	Addition of 16 additional groundwater sampling locations for Q3 monitoring event	Following the completion of the April 2025 monitoring event, AECOM recommended that the following monitoring wells be re-sampled during the next scheduled monitoring event to confirm the PFAS concentrations that were reported (the wells include: MW142D, MW142S, MW144, MW165, MW238D, MW238S, MW252S, MW262S, MW266S, MW266D, MW536, MW537, MW538 and POT085, POT236 and POT365)
7	Change of the PFAS standard analytical suite LOR for up to eight groundwater sampling locations	Following the completion of the April 2025 event, AECOM recommended the revision of the level of detection applied in the analysis of samples (from standard to low level) for eight groundwater monitoring locations where the concentrations of PFOS were below the standard level of detection during that event (MW108D, MW134D, MW134I, MW240D, MW245D, MW317D, MW340S, MW406). Lowering the detection limit would enable the review of data against the revised drinking water guidelines.
8	Replacement of monitoring well MW132S with MW132I	Following an audit of data collected under the OMP, it was identified that samples collected from well MW132S had been inadvertently collected from monitoring well MW132I. Monitoring well MW132S appears to have been destroyed or lost. AECOM has updated the SAQP to correctly identify the well as MW132I.

Appendix C

SOP for Aquatic Biota Sampling

APPENDIX C:

Standard Operating Procedure for Aquatic Biota Sampling

1.0 Introduction

This procedure describes the methods for collecting representative aquatic biota samples from Fullerton Cove. If followed properly, use of this procedure will promote consistency in sampling collection and ensure regulatory compliance across Australia where best practice guidelines have been developed.

It is assumed that an appropriately experienced sub-contractor will be engaged to undertake the sampling. The subcontractor should hold the appropriate sampling permits and ethics approvals for the specific activity that is being undertaken. The sub-contractor engaged will supply all the necessary equipment to catch and store the samples on the vessel.

It is anticipated that an Environmental Scientist will be present at all times during the sampling stage of the works. However, in instances where this may not be possible due to the restrictions of the vessel, the sub-contractor will be fully briefed by the Environmental Consultant as to the procedure required.

2.0 Health and Safety

Health and Safety Plan (HASP) and task specific Safe Work Method Statements (SWMS) will be prepared prior to field works. The SWMS or Job Safety Analysis (JSA) will also be prepared by the sub-contractor for their specific tasks.

Prior to commencement of the works the project team will review the SWMS/JSA and discuss the potential hazards and mitigation measures.

Once the project team arrive at the sampling location, the hazards must be identified and adequate precautions must be taken to ensure the safety of the sampling team.

All sampling personnel must wear personal flotation devices (life vests). In addition it is assumed that the majority of the sampling will be from a boat, where appropriate protective measures must be identified and implemented in accordance with reviewed and approved HASP and SWMS/JSA. In addition, the use of electronic position indicating radio beacons (EPIRBs) will be considered.

3.0 Equipment

Equipment needed for collection of aquatic biota samples, may include:

- Stainless steel buckets.
- Two stainless steel identification board.
- Stainless steel ruler.
- Laboratory supplied polypropylene containers.
- GPS.
- Camera.
- Clipboard.
- Analytical-quality de-ionised water (15 L).
- Notebook / Felt-tipped markers / Waterproof labels.
- Digital scales.
- Cool box and ice.

- Figures of the sampling sites.
- Life vests.

4.0 Procedure

The following steps will be performed:

Monitoring

The following monitoring will be undertaken:

- Target sentinel species, namely School Prawn, Luderick and Dusky Flathead.
- Collection 4 composites of up to 10 individuals be prepared for each species.
- Monitor in Fullerton Cove.
- Monitor between December to March, every second year.

Planning, Mobilisation and Setup

- Prior to mobilisation, the sampling team will review the SAQP and this SOP to ensure they are familiar with the sampling plan, the sampling methods to be employed, and the types and amounts of equipment and supplies needed. This will be conducted by a project kick-off meeting.
- A kick-off meeting will also be conducted with the sub-contractor to ensure that the appropriate documentation in terms of permits are in place.
- The laboratory will be contacted at a minimum of one week prior to the intended sampling date to confirm the mass of tissue required and to ensure that the laboratory has the appropriate personnel available for preparation.
- Field staff will arrange field sampling equipment, as required.
- Weather forecast will be checked in the lead up to the sampling event. In the event that the forecast indicates stormy conditions, the sampling will be postponed until the weather clears.

On Arrival to Site/ Daily

- The conditions on arrival at site will be evaluated and discussed during the Toolbox talk. The sampling team will review the HASP and any modifications to the HASP and SWMS/JSA will be documented.
- Date, time of arrival on site, and site conditions (including weather) will be recorded.
- General locations for sampling will be marked or identified on a site map with a geo-reference to landmarks/topography. GPS coordinates will be recorded for each location. As required, the proposed locations may be adjusted based on site conditions and access.
- Photographs of the sampling locations and surrounding conditions will be taken.

Sampling

- Prior to sampling all dissection equipment will be decontaminated using laboratory supplied deionized water and three separate rinse stages. Sampling and monitoring equipment will also be decontaminated between sampling events at the same location, and following completion of the sampling event.
- Buckets will be prepared for sample holding and cleaning. One bucket (Bucket 1) will be filled with the local water and labelled and a second (Bucket 2) and third bucket (Bucket 3) with DI water. Scrubbing brushes will be used to clean the sample, where required. All scrubbing brushes will be kept in their appropriate buckets – labelling buckets and scrubbing brushes will ensure they are not mixed.
- Samples will be captured utilising the following process, similar to the previous methodologies used during the DSI, and undertaken in accordance with the appropriate permits and ethics approval:
 - Boats will be used to deploy mesh netting. Nets will be placed over night in the target locations and will be collected the following morning. Observations on the number of target species captured, bycatch and water quality will be recorded. Bycatch will be returned to the water, where possible.

- A prawn trawler will be used to trawl a net throughout the target area. At the end of each sampling run the net will be inspected. Observations on the number of target species captured, bycatch and water quality will be recorded. Bycatch will be returned to the water, where possible.
- All target specimens will be retrieved from the nets, euthanised, then prepared for processing to the laboratory. Target fish will be euthanized by blunt force trauma, followed by exsanguination. No compositing will be undertaken in the field.
- Whole samples will be placed on the first identification board, and assigned one of three groupings; Group PR, Group GX or Group GY by the environmental consultant. Groupings are presented in **Table 1**. The species will be logged and measured to confirm if the sample is the legal length, where applicable.
- Where sample does not meet the legal requirements, the sample details will still be recorded, but returned to the water.
- If sample meets the appropriate requirements, it will be placed in Bucket 1 and rinsed of foreign matter.
- The sample will be assigned a sample ID, as per the sample naming system presented in **Table 2** below. The sample will be moved from Bucket 1 and euthanized.
- The sample will be weighed and the weight recorded together with the biometric information as per **Table 3**. Where the specie is from one of the sample groups that are to be composited, sufficient species will be grouped together, with sufficient mass, to form the one sample (with one sample ID).
- After weighing, the sample will be placed in Bucket 2 (containing DI water), scrubbed with a brush and rinsed, the sample will then be rinsed in Bucket 3. The sample will be photographed after it is rinsed. Rinsate samples will be collected as documented in the OMP.
- The sample will be placed into the appropriate sample containers and labelled with the ID. In addition, the sample will also be labelled with the time the sample was bagged and weight of the sample. The sample will be photographed after it is bagged.
- Samples will be placed on ice, the chain of custody (CoC) documentation completed including the job number. Date and time of sample collection, sample ID, name of sampler, laboratory to be used, analyses required, any comments and signatures of the sampler and laboratory receiver.
- The samples will be transported to the laboratory as soon as practicable.
- Upon receipt of the original documents accompanying the samples at the laboratory, the laboratory will provide a sample receipt document (noting temperature of samples upon receipt, analyses required and any non-conformances) and return the signed CoC form to confirm analyses to be performed. Subject to laboratory processing times the samples will be processed and dissected on the day following capture (within the laboratory).

On Leaving Site

- Place all specimens in appropriate containers and chilled.
- Ensure all samples are appropriately labelled and kept out of sunlight once sampled.
- Call the laboratory and let them know that the samples are being delivered.
- Follow the communications plan detailed in the HASP on demobilisation from site.

5.0 Sample Preparation

As noted in **Section 4.0**, samples are caught whole, washed at the point of sampling and then transported to the laboratory.

The samples will be registered in line with the laboratory procedures (as noted in **Section 4.0**).

Two types of sample preparation will be required depending on the Biota Group:

- Group PR will be prepared as composite samples as detailed in **Section 5.1**; and
- Group X and Group Y will be prepared as whole samples.

5.1 Composite sampling (prawns)

This step relates to samples with an ID relating to Group PR.

The sample will be removed from its storage container and deshelled. The edible portion of the sample will be removed from the remainder of the sample. The portion of the sample removed from the shell will be weighed and recorded.

The deshelled portion will be placed into an appropriate container.

All surfaces and equipment discarded or cleaned with scrubbing and clean water between each sample. Knife mill and homogeniser cleaned with PFAS-free detergent and clean water.

All samples to be held will be placed into appropriate storage containers and placed in freezers in the laboratory.

5.2 Whole samples (fillets)

This step relates to samples with an ID relating to Group GX and Group GY.

The sample will be descaled and gutted.

If the contents of the gut are identifiable, it will be recorded.

Where fish gonads (i.e. roe and milt) are present, they will be removed from the fish and recorded. The fish gonads will be placed in separate containers and assigned an ID of the parent fish, with a sub ID GONADS. The sample will be frozen and placed on hold and will be analysed, pending discussion with project team.

Once the sample is descaled and gutted, the sample will be filleted with the skin intact. The right side fillet will be used as the primary sample and the left side fillet will be placed on hold. Where a fish is earmarked for duplicate or triplicate analysis the left fillet of the primary will be used.

All surfaces and equipment discarded or cleaned with scrubbing and clean water between each sample. Knife mill and homogeniser cleaned with PFAS-free detergent and clean water.

5.3 Sample Details

The length for each species is provided in **Table 1**, below.

Table 1 Species List and Groupings

Species	Legal length* cm Saltwater
PR	
School Prawn (<i>Metapenaeus macleayi</i>)	-
Group GX	
Dusky Flathead (<i>Platycephalus fuscus</i>)	36
Group GY	
Luderick (<i>Girella tricuspidata</i>)	27

*Legal Length (should be confirmed with NSW DPI website at the time of sampling)

The sample nomenclature is presented in **Table 2**, the example shows that sampling occurs in Fullerton Cove (FC) with one dusky flathead, one luderick and one school prawn caught.

Table 2 Sampling Nomenclature

Site	Species Group	Sample number	Date	Sample ID	Comment
FC	PR	002	20180111	FC_PR_002_20180111	School Prawn
FC	GX	003	20180111	FC_GX_003_20180111	Dusky Flathead
FC	GY	003	20180111	FC_GY_003_20180111	Luderick

The information that is required to be recorded is provided in **Table 3**, below.

Table 3 Information to be recorded per sample

Item
Sampling Location

1.0 Introduction

1.1 General

AECOM Australia Pty Ltd (AECOM) has been engaged by the Department of Defence (Defence) to implement the per- and poly-fluoroalkyl substances (PFAS) Ongoing Monitoring Plan (OMP) at RAAF Base Williamtown (the 'base,' Site ID 0908) and the Williamtown Management Area in New South Wales (NSW). The location of the base and Management Area is shown in **Figure F1** in **Appendix A**.

The OMP (Defence, 2023b) outlines the sampling requirements for the base and off-base areas within the Management Area.

Following each sampling event, a Sampling Event Report (SER) will be prepared. An Ongoing Monitoring Report (OMR) will be prepared following the completion of each 12-month sampling period.

This SER has been prepared to report the results of the 2025 annual sampling event conducted in April 2025, with additional sampling in May 2025 and June 2025. This SER compares the data collected during this event against specific triggers defined in the OMP (Defence, 2023b), including highlighting first-time detections and/or new exceedances of human health Australian guideline values, namely for perfluorooctane sulfonic acid (PFOS), perfluorohexane sulfonic acid (PFHxS), perfluorooctanoic acid (PFOA) and perfluorobutane sulfonic acid (PFBS).

This SER has been prepared in accordance with the Defence *Ongoing Monitoring Program Reporting - Guidance* issued in February 2024 (Defence, 2024).

1.2 Objectives

The objectives of this monitoring event were to:

- implement the OMP (Defence, 2023b); and
- collect data that will enable Defence to maintain an up to date understanding of the distribution, concentration, transport, and transformation of PFAS.

The data collected may be used to inform where new risk management actions may be required, or to support a determination that remediation has been completed so far as reasonably practicable, including updates and revisions to the PFAS Management Area Plan (PMAP) (Defence, 2023a).

The objective of this phase of works was to implement the scope of works for the annual sampling event in accordance with the Sampling and Analysis Quality Plan (SAQP) (AECOM, 2025).

2.0 Scope of Work

The scope of work was completed in general accordance with the SAQP (AECOM, 2025), as follows:

- obtain permission (where required) to conduct works at the base, off-base publicly accessible areas and at private properties
- groundwater sampling and collection of water quality parameters at 127 of 136 scheduled monitoring wells and bores (refer to **Table 1** below, and **Figure F2** in **Appendix A** for specific locations)
- groundwater sampling and collection of water quality parameters at 12 of 14 ad hoc monitoring well and bore locations (refer to **Table 1** below, and **Figures F2-1** to **F2-4** in **Appendix A** for specific locations). These locations were added to the SAQP (AECOM, 2025) for the purpose of delineation of PFAS at low level of detection during this annual sampling event. These locations will subsequently be reviewed for potential inclusion in the OMP.
- surface water sampling and collection of water quality parameters at all 25 scheduled surface water locations (refer to **Table 2** below and **Figure F3** in **Appendix A** for specific locations)
- sediment sampling at all 26 scheduled sediment locations (refer to **Table 3** below and **Figure F4** in **Appendix A** for specific locations)
- gauging of groundwater levels in monitoring wells prior to collection of samples and for targeted gauging event (refer to **Table 5** in **Section 4.1** for the targeted gauging event locations)
- collection of field duplicate samples at a rate of 1 in 10 primary samples for water
- collection of field duplicate samples at a rate of 1 in 20 primary samples for sediment
- analysis of samples from 125 of 131 scheduled sampling locations for PFAS full suite at the standard limit of reporting (LOR) and analysis of samples from 65 of 70 scheduled sampling locations for PFAS full suite at the low level LOR
- data management of the OMP field and laboratory data in Defence ESdat database
- preparation of this SER.

The deviations from the scheduled scope of works are discussed in detail in **Section 3.0**.

Note: due to privacy considerations, selected monitoring locations are unable to be shown on the figures in **Appendix A**.

Table 1 Groundwater Sampling Locations

On/Off-base	Area	Sampling Location	PFAS Analysis LOR	Total

3.0 Deviations from the SAQP

The annual sampling event was completed in general accordance with the SAQP (AECOM, 2025). Deviations from the SAQP are provided in **Table 4** below.

Table 4 Deviations from SAQP

SAQP Deviation	Comment / Justification	Impact on Dataset
Samples, and associated field parameters, were not collected from 9 of the 136 scheduled annual groundwater sampling locations.	MW238D, MW238S, POT085 and POT236 (groundwater sampling locations at private residential properties) were not sampled as access approval from property owners was not received within the sampling period. MW252S (located on Hunter Water land) was not sampled due to flood water covering the monitoring well. The location was visited on separate occasions during the sampling event, however the flood water had not subsided. MW104D, MW104S, MW184D, and MW184S (located at Newcastle Airport) were not sampled as they were destroyed by construction works.	The lack of sampling data at MW238D and MW238S is not considered to present a significant data gap, as a nearby monitoring well (MW139 to the southwest) was able to be sampled. The lack of sampling data at POT085 and POT236 could represent a data gap, given these locations have not been sampled since 2023. However, it is noted that historical data at these locations show stable PFAS concentrations since 2016, either consistently below the level of detection (POT085) or consistently above the adopted drinking water guidelines (POT236). The lack of sampling data at MW252S is considered a potential data gap as there is limited coverage in this area to the east of the base. However, it is noted that historical data at this location shows PFAS concentrations decreasing from 2017, while still consistently above the adopted drinking water guidelines for PFOS and PFHxS. The lack of sampling data at MW104D, MW104S, MW184D, and MW184S is considered a potential data gap as there is limited coverage to the south of the base. However, it is noted that historical data at these locations show PFAS concentrations being stable (for MW104S) or decreasing (for MW104D, MW184S, MW184D) from 2017, and consistently above the adopted drinking water and recreational guidelines.
Field parameters and gauging data were not collected from one of the 136 scheduled annual groundwater sampling locations.	MW406 was sampled however due to an equipment error, the field parameters and gauging data taken at the time of sampling were lost.	The lack of gauging data and water quality parameters at MW406 is not considered to be a significant data gap given that historical field data has been collected and samples for PFAS analysis were collected.

SAQP Deviation	Comment / Justification	Impact on Dataset
Gauging data was not collected from one of the 29 selected monitoring wells for the targeted gauging round.	MW162D was unable to be gauged during the gauging round as the gatic lugs and j-cap were jammed. On a return visit to the location, following repair works, the cap was able to be opened and the location was able to be gauged and sampled.	The lack of gauging data from the gauging round at MW162D is not considered to be a significant data gap, as the other wells in the gauging round were gauged and provided sufficient data for the groundwater elevation plan.
Samples, and associated field parameters, were not collected from two of the 14 planned ad hoc groundwater sampling locations.	MW266D (groundwater monitoring well located on residential property) was not sampled as the gatic bolts were rusted and the well could not be accessed. MW165 (groundwater monitoring well on the road verge) was not sampled as the well could not be located due to overgrown grass.	The lack of sampling data at MW165 is considered to be a potential data gap given the location provides coverage for the boundary of the Broader Management Zone to the east of the base. It is noted that historical data at this location, from 2016 to 2019, show PFAS concentrations below the standard level of detection. The lack of sampling data at MW266D is not considered a significant data gap given the nearby shallow well (MW266S) was able to be sampled.
Change in adopted Human Health (Drinking Water) screening criteria	In June 2025, the National Health and Medical Research Council (NHMRC) released updated drinking water guidelines for PFOS, PFHxS, PFOA and PFBS. As a result, AECOM has adopted these revised drinking water criteria for this sampling event, superseding the drinking water criteria presented in the SAQP (AECOM, 2025) and in the OMP (Defence, 2023b) which were sourced from the PFAS National Environmental Management Plan (NEMP) 3.0 (HEPA 2025).	The revised drinking water screening criteria for PFOS is 0.008 µg/L, which is below the standard laboratory LOR (0.02 µg/L). In anticipation of the NHMRC (2025) being released, AECOM scheduled selected samples (from locations where concentrations were historically either below the laboratory LOR or below the former drinking water screening criteria) for low level PFAS analysis. However, a number of groundwater samples remained scheduled for standard LOR analysis in the SAQP (AECOM, 2025). For those samples (collected from MW108D, MW134D, MW134I, MW240D, MW245D, MW317D, MW340S, and MW406), the LOR for PFOS was above the updated ADGW (NHMRC, 2025). As a result, where those samples were below the LOR, they were not able to be compared to the adopted drinking water criteria.

4.0 Methodology

4.1 Sampling Methodology

The methodology used for the annual sampling event was in general accordance with the SAQP (AECOM, 2025) and is summarised in **Table 5** below.

Table 5 Sampling Methodology

Item	Details
Groundwater gauging	The depth to groundwater was measured in each monitoring well immediately prior to collection of groundwater samples (where sampling was required) using an interface probe. In addition, a targeted gauging round including 29 selected monitoring wells was completed to generate data for the groundwater elevation contours and assess groundwater flow direction. The targeted gauging round was completed on 1 April 2025. The selected locations for the targeted gauging event are as follows: • shallow wells: MW106S, MW122, MW123, MW124, MW125S, MW126S, MW146S, MW162S, MW188S, MW232S, MW247S, MW256S, MW257S, MW260S, MW268S and MW897S • deep monitoring wells: MW106D, MW125D, MW126D, MW146AD, MW162D, MW188D, MW232D, MW247D, MW256D, MW257D, MW260D, MW268D and MW897D. Measurements of depth to groundwater were undertaken using a decontaminated interface probe, which was serviced by the supplier prior to use. The equipment supplier records are provided in Appendix C.
Field parameters	Temperature, electrical conductivity, dissolved oxygen, oxidation-reduction potential (ORP), pH and observations of water quality were recorded for groundwater and surface water samples. Water quality parameters were collected using a calibrated water quality meter. The equipment supplier service and calibration records, and field calibration records are provided in Appendix C.
Sampling methodology	Groundwater Monitoring Wells Groundwater samples were collected from monitoring wells using a no-purge methodology with HydraSleeves™ which were installed within the screened interval of the wells and avoiding placing the base of the HydraSleeves™ at the base of the monitoring well, where a build-up of sediment may be present. The installation depth of the HydraSleeves™ was recorded (as HydraSleeve™ collar depth in metres below top of casing [mbTOC]). HydraSleeves™, with bottom weights only, were installed / deployed in monitoring wells for a minimum of 4 hours prior to sampling, to allow the aquifer to equilibrate before the samples were collected. For this event, the HydraSleeves™ were installed ahead of / during the annual sampling event. Following sampling, water quality parameters were recorded ex-situ, from excess water present in the HydraSleeve™. As per the SAQP (AECOM, 2025), the groundwater sample from MW829 was collected using a dedicated disposable HDPE bailer, as this pump station bore/sampling point is a non-traditional well with no well cap or gatic, and groundwater from monitoring wells MW842 and MW844 were collected using a peristaltic pump, due to the narrow diameter of the PVC casing being too small for HydraSleeves™.

Item	Details
	Residential Bores Bore water samples were collected by placing the new laboratory provided sample bottles beneath the tap outlet and the tap slowly opened to collect the “first flush” of water, with the caps immediately installed once the containers were full. Following sampling, water quality parameters were recorded ex-situ, by placing the water quality meter probe in a cup filled with bore water from the tap outlet. Surface Water Surface water samples were collected from either mid-way through the water column or approximately 0.5 m below the surface (if possible) using a ‘grab’ sample method, without disturbing the bottom of the surface water body and without capturing any surface film, to minimise collection of sediment, or floating materials in the samples. At each location, new laboratory supplied containers were lowered into the water with the caps immediately applied once the containers were full. Where sampling points were not able to be accessed safely, surface water samples were collected with use of a sampling pole. Description of each sampling location were recorded (including physical setting, flow observations, presence of sheen or foam etc). Sediment Sediment samples were collected from a depth representative of potentially deposited sediments and collected from within the water body, using a hand trowel to a maximum depth of 0.3 m below the sediment surface. A new laboratory supplied container was used at each location for collection of samples, and any reusable sampling equipment (i.e. trowel) utilised was de-contaminated between locations. Description of each sampling location and the sample material was recorded.
QA/QC Samples	A Quality Assurance and Quality Control (QA/QC) program was implemented for the sampling and analysis program in order to obtain representative data and assess the reliability of the data obtained. To facilitate the QA/QC program the following sample types were obtained during the sampling program: • <i>Intra-laboratory duplicates</i> collected at a rate of 1 in 10 primary samples for water matrices and 1 in 20 for sediment matrices. The relative percentage difference (RPD) should be less than 30%, or less than 50% if results are less than 20 times the LOR. Higher RPDs may also be acceptable if results are less than 10 times the LOR. • <i>Inter-laboratory duplicates</i> collected at a rate of 1 in 10 primary samples for water matrices and 1 in 20 for sediment matrices. The RPD should be less than 30%, or less than 50% if results are less than 20 times the LOR. Higher RPDs may also be acceptable if results are less than 10 times the LOR. • <i>Rinsate blanks</i> collected at a frequency of one per set of sampling equipment per day where equipment was reused between locations. Analytical results should be below the laboratory LOR. The QA/QC samples for the annual sampling event included: • 19 x intra-laboratory duplicates comprising 17 water (15 groundwater, 2 surface water) and 2 sediment, which met the total target frequency

Item	Details
	19 x inter-laboratory duplicates, comprising 17 water (16 groundwater, 1 surface water) and 2 sediment, which met the total target frequency 13 x rinsate blanks, which met the total target frequency. The total number of primary samples collected amounts to 194 samples, comprising 167 samples for water (142 groundwater, 25 surface water) and 27 samples for sediment. The detailed data validation assessment is presented in Appendix D.
Sample analysis	Samples were submitted for PFAS full suite analysis using standard level of detection (i.e. standard LOR), with the exception of select groundwater monitoring locations submitted for low level of detection (i.e. low level LOR) (refer to Table 1 in Section 2.0 for specific locations). ALS Environmental (ALS) Sydney, NSW was used as the primary laboratory. Envirolab Services (Envirolab) Sydney, NSW was used as the secondary laboratory. ALS and Envirolab methods for analyses were certified by the National Association of Testing Authorities (NATA). A summary of the laboratory results is presented in Section 5.3 and the laboratory certificates are presented in Appendix E.

4.2 Adopted Screening Criteria

Guidance documents used to assess the dataset include the following:

- PFAS National Environmental Management Plan (NEMP) Version 3.0, Heads of EPA (HEPA) Australia and New Zealand. March 2025 (HEPA, 2025)
- Department of Health (DoH), 2017. *Health Based Guidance Values for PFAS for use in site investigations in Australia*. April 2017.
- National Health and Medical Research Council (NHMRC), 2019. *Guidance on PFAS in Recreational Water*. August 2019.
- NHMRC, 2025. *Australian Drinking Water Guidelines 6, 2011 - National Water Quality Management Strategy*. Version 4.0 Updated June 2025.

The adopted PFAS screening criteria to assess the data generated as part of the OMP are presented in **Table 6** below. It is noted that at the time of preparing this report, the PFAS NEMP 3.0 (HEPA, 2025) did not provide any screening criteria for PFAS in sediments.

Table 6 Summary of Adopted Screening Criteria: Water

Media	Pathway	Compound	Criteria	Comment/Reference
Human Health Receptors				
Water – Groundwater	Drinking water	PFOS	0.008 µg/L	The values are from the ADWG (NHMRC, 2025) which includes revised guidance criteria for PFOS, PFHxS, PFOA and PFBS, released in June 2025. <i>All groundwater results were compared to these criteria.</i>
		PFHxS	0.03 µg/L	
		PFOA	0.2 µg/L	
		PFBS	1 µg/L	
Water – Surface Water and Groundwater	Recreational use	PFOS + PFHxS	2 µg/L	The values are from the PFAS NEMP (HEPA, 2025) which are based on the NHMRC (2019) values. Note: given that groundwater at the base is extracted for irrigation purposes (post treatment), the recreational guidelines have been adopted to be protective of this water use activity. Note: groundwater at the base was also screened against the drinking water guidelines as specified above. <i>All surface water and groundwater results were compared to these criteria.</i>
		PFOA	10 µg/L	
Ecological Receptors				
Water – Groundwater and Surface Water	Freshwater	PFOS	0.00023 µg/L	The values are from the PFAS NEMP (HEPA, 2025) which endorsed the Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2023). The 99% species protection level has been applied for high value conservation systems. This approach is generally adopted for chemicals that bioaccumulate and biomagnify in wildlife. It is proposed that the laboratory LOR is adopted for the purposes of preliminary screening of analytical water results, rather than sole use of the criteria value. <i>All groundwater and surface water results were compared to these criteria.</i>
		PFOA	19 µg/L	

4.3 Triggers Levels

The following trigger levels as presented in the OMP (Defence, 2023b) have also been assessed:

- First-time detection of PFAS in groundwater / surface water
- First-time exceedance of the drinking water guideline in groundwater
- First-time exceedance of the recreational water guideline in surface water

- First-time exceedance in groundwater of the groundwater exposure point concentration (EPC) used in the Human Health Risk Assessment (HHRA) (AECOM, 2017b) for the relevant Risk Zone¹:
 - o Risk Zone A – PFOS+PFHxS: 190.3 µg/L
 - o Risk Zone B – PFOS+PFHxS: 5.67 µg/L
 - o Risk Zone C & D – PFOS+PFHxS: 0.05 µg/L
- First-time exceedance in surface water of the surface water EPC for 95th percentile used in the 2017 HHRA (AECOM, 2017b):
 - o Marine Water - PFOS: 1.78 µg/L, PFHxS: 1.48 µg/L
 - o Region 1 – PFOS: 5.035 µg/L, PFHxS: 1.666 µg/L
 - o Region 2 – PFOS: 1.47 µg/L, PFHxS: 1.009 µg/L
 - o Region 3 – PFOS: 7.743 µg/L, PFHxS: 6.773 µg/L
- Sediment PFAS concentration increase in two consecutive sampling events

Note that PFAS trends will be reviewed and discussed in the next OMR, together with a review of the CSM and risk profile.

4.4 Data Quality Objectives and Data Validation

The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2025). The data validation assessment is provided in **Appendix D**.

Data validation procedures employed in the assessment of the field and laboratory's Quality Assurance and Quality Control data, completed as per Section 3.2 of the SAQP, indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable (i.e. >95% of the data was suitable for use and DQIs passed acceptance criteria) for the purpose of this SER.

Following the reporting of PFAS concentrations which were either exceeding an OMP trigger level or were considered to potentially be anomalous, the primary laboratory was requested to repeat the analysis for MW231S, MW262S, MW538, and SD326. The reanalysis and originally reported PFAS concentrations were within an order of magnitude of each other and the primary laboratory did not identify any procedural or analytical errors pertaining to their analysis. As such, the most conservative, originally reported concentrations have been retained and used in this report.

Further details are provided in the data validation assessment in **Appendix D**.

All data collected during this event have been reviewed and uploaded to the Defence ESdat database in accordance with Defence Contamination Management Manual requirements.

¹ Risk Zones and Regions as defined in the HHRA (AECOM, 2017b), detailed below. The extent of the Risk Zones and Regions are shown in the HHRA (2017b) maps displayed in **Appendix F** of this report.

- **Marine Water:** various water bodies such as those associated with Port Stephens and Hunter River (i.e. Fullerton Cove for the purpose of the OMP)
- **Region 1:** the area east of the base, generally following Moors Drain and discharging at the tidal portion of Tilligerry Creek.
- **Region 2:** the area along Tilligerry Creek south east of the base which discharges in the tidal portion of Tilligerry Creek
- **Region 3:** the surface water drainage network south of the base, which predominantly discharges at Fullerton Cove.
- **Risk Zone A** is defined by the footprint of the Southern Area, which includes a portion of Region 3.
- **Risk Zone B** is defined by the footprint of the Eastern Area, which includes a portion of both Region 1 and Region 3.
- **Risk Zone C** is defined by that portion of the footprint of the remaining area, which corresponds with Region 1 and Region 3.
- **Risk Zone D** is defined by that portion of the footprint of the remaining area, which corresponds with Region 2.

5.0 Field Observations and Results

5.1 General Observations

The weather conditions and general observations (including activities that may impact the monitoring program) recorded during the annual sampling event are summarised below in Table 7.

The sampling event and related activities, such as the deployment of HydraSleeves™ and the gauging event, took place between 31 March 2025 and 17 April 2025, with subsequent visits on 26 and 27 May 2025 and 10 June 2025.

Table 7 General Observations

Items	Observations
Weather Conditions	The following weather observations are for Williamtown (Williamtown RAAF, Station 061078) (Bureau of Meteorology, 2025). Maximum daily temperatures across the sampling event days ranged between 17.4 °C (10 June 2025) and 28.2 °C (11 April 2025). The monthly mean maximum temperature for April, May and June were 24.7 °C, 20.5 °C and 17.5 °C, respectively. Rainfall was recorded across 2, 4, 12, 13, and 14 April 2025, as well as on 27 May 2025. Across the sampling event days, a total of 62 mm of rainfall were recorded. The monthly totals for April, May and June were 180 mm, 502 mm and 65.4 mm of rainfall, respectively.
Estate Management Works, Training Activities and/or Construction Works.	No estate management works, training activities or construction works, with the potential to impact the program, were observed during the sampling event.

5.2 Field Observations and Measurements

The observations and measurements recorded during the field activities are summarised in **Table 8**, below.

Table 8 Field Observations and Measurements

Item	Description
Monitoring Well Network Condition	The following observations of the well network were noted: - MW106S, MW126S, MW132I, MW162S, MW168, MW169D: well gatic lugs for bolts were rusted. - MW108D, MW125S, MW125D, MW128D, MW146S, MW188S, MW231S, MW271S, MW281S: well gatic lid unable to be closed due to the PVC and/or J-cap height. - MW106S, MW107D, MW107S, MW168, MW169S, MW230S, MW278S, MW280S: well gatic bolts were missing, however unable to be replaced due to rusting of lugs (MW106S, MW168, MW169S, MW169D) or non-standard bolt size (MW107S, MW107D, MW166, MW230S, MW278S, MW280S). - MW232D, MW731D: well monument lid hinge broken. - MW106D, MW108D, MW108S, MW172, MW179D, MW264S: wells may have a blockage close to the base of the wells. Note that groundwater was able to be sampled from within the screen interval (for sampling locations), and therefore considered representative.

Item	Description
	- MW109D: well gatic was full of water above the top of casing. The water was removed prior to sampling. Given the J-cap was secure, water ingress into the well was unlikely, and the groundwater sampled was considered representative. - MW162D: the well casing had moved within the gatic, and as a result it was not possible to remove the J-cap to sample during the initial visit. This well was repaired and sampled on a later mobilisation.
Water Observations	No visible signs of contamination were observed in the groundwater and surface water locations sampled. Organic and sulphurous odours were noted at 51 groundwater locations (refer to Table T2 in Appendix B) and two surface water locations (SW582 and SW600).
Depth to Groundwater and Flow Direction	During the sampling event, depth to groundwater ranged from 0.000 (MW108S, MW109D, MW231D, MW266S and MW886) and 3.650 (MW304) mbTOC, and groundwater elevation ranged between -0.038 (MW128S) and 8.663 (MW264D) metres Australian Height Datum (mAHD). Groundwater gauging data is presented in Table T1 in Appendix B. The inferred groundwater flow direction is to the south and southeast, towards Tilligerry Creek and Fourteen Foot Drain, and to the north and northeast, south of Tilligerry Creek, Fourteen Foot Drain and Ten Foot Drain (refer to Figure F5-1 and F5-2 in Appendix A), which was generally consistent with previous flow directions. Note that the groundwater elevation contours in Figure F5-1 and Figure F5-2 are based on the gauging 28 of 29 selected wells on 1 April 2025, to minimise the potential for temporal variability.
Water Quality Parameters	Groundwater and surface water quality parameters were measured during the collection of water samples. The readings are presented in Table T2 and Table T3 in Appendix B and are summarised below: Groundwater Quality Parameters - Dissolved oxygen ranged from 0.69 mg/L (MW262S) to 8.13 mg/L (MW231D) indicating poor to well oxygenated conditions. - Electrical conductivity ranged from 40.6 µS/cm (MW257D) to 41,842 µS/cm (MW266S) indicating fresh to saline conditions. - pH ranged from 4.11 (MW245S) to 7.82 (MW128D) indicating acidic to mildly alkaline conditions. - ORP (corrected) ranged from -1.7 mV (MW231D) to 438.4 mV (MW829) indicating reducing to mildly oxidising conditions. - Temperature ranged from 17.0°C (MW262D) to 26.9°C (POT144). Surface Water Quality Parameters - Dissolved oxygen ranged from 1.39 mg/L (SW588) to 9.72 mg/L (SW600) indicating moderately to well oxygenated conditions. - Electrical conductivity ranged from 86.4 µS/cm (SW048) to 9,934 µS/cm (SW259) indicating fresh to brackish conditions. - pH ranged from 5.09 (SW001 and SW059) to 7.21 (SW019) indicating mildly acidic to near neutral conditions. - ORP (corrected) ranged from 188 mV (SW019) to 390.9 mV (SW059) indicating mildly reducing to mildly oxidising conditions.

Item	Description
	Temperature ranged from 17.9°C (SW006) to 26.3°C (SW600).
Sediment Observations	Sediment sampled and logged during this sampling event comprised sand, silt and clay materials with varying amounts of organic material inclusions (roots, leaves, grass) and, for some materials, traces of gravels or shell fragments. Organic odours were noted in three sediment locations (SD005, SD081 and SD600). Refer to in Table T4 in Appendix B for a summary of sediment classifications and observations.

5.3 Summary of Analytical Results

5.3.1 Groundwater Analytical Results

The groundwater PFAS analytical results from this sampling event are presented in **Table T5 in Appendix B**. In summary, 139 primary groundwater samples were analysed for PFAS during this sampling event, of these:

- 120 primary samples reported concentrations of PFAS with Australian guideline values (PFOA, PFOS, PFHxS, and PFBS) above the adopted laboratory LOR
- 86 primary samples exceeded the adopted human health drinking water screening criteria for PFOA, PFOS, PFHxS and/or PFBS
- 26 primary samples exceeded the adopted human health recreational water screening criteria for PFOA and/or PFOS+PFHxS
- 104 primary samples exceeded the adopted ecological screening criteria for PFOA and/or PFOS.

The groundwater sampling locations, their sampling status and applicable triggers are presented in **Figures F6-1 to 6-4 in Appendix A**.

5.3.2 Surface Water Analytical Results

The surface water PFAS analytical results from this sampling event are presented in **Table T6 in Appendix B**. In summary, 27 primary surface water samples were analysed for PFAS during this sampling event, of these:

- 25 primary samples reported concentrations of PFAS with Australian guideline values (PFOA, PFOS, PFHxS, and PFBS) above the adopted laboratory LOR
- 12 primary samples exceeded the adopted human health recreational water screening criteria for PFOA and/or PFOS+PFHxS
- 25 primary samples exceeded the adopted ecological screening criteria for PFOA and/or PFOS.

The surface water sampling locations, their sampling status and any applicable triggers are presented in **Figure F7 in Appendix A**.

5.3.3 Sediment Analytical Results

The sediment PFAS analytical results from this sampling event are presented in **Table T7 in Appendix B**. In summary, 26 primary sediment samples were analysed for PFAS during this sampling event. All 26 primary samples reported concentrations of PFAS with Australian guideline values (PFOA, PFOS, PFHxS, and PFBS) above the adopted laboratory LOR.

The sediment sampling locations, their sampling status and any applicable triggers are presented in **Figure F8 in Appendix A**.

5.3.4 Historical Analytical Results

The groundwater, surface water and sediment PFAS analytical results from this sampling event as well as historical data for all locations currently in the OMP scope, as per the SAQP (AECOM, 2025), are presented in **Table T8**, **Table T9** and **Table T10** (respectively) in **Appendix B**.

5.4 Trigger Levels Assessment

The assessment of analytical results from this sampling event against the OMP trigger levels and associated responses is presented in **Table 9**.

Table 9 Trigger Levels Assessment

Trigger Type	Analyte	Triggers in Annual Sampling Event Data Location (Concentration)	Responses
First-time detection of PFAS (for PFAS with Australian guideline values), in groundwater and surface water. <i>Note: These triggers are highlighted in blue in the result figure, Figure F6 in Appendix A, and in the analytical table, Table T8 in Appendix B. Where the trigger is also a first-time exceedance of human health guidelines, these are highlighted in yellow.</i> <i>Additionally, the first-time detections of PFOS are also first-time exceedances of the adopted ecological guideline (HEPA, 2025) – while not an OMP trigger, these have also been highlighted in yellow along with first-time exceedances of adopted human health criteria.</i>	PFOA	- MW230S (0.004 µg/L) - MW271S (0.003 µg/L) - MW538 (0.011 µg/L)	- The majority of the first-time detections reported for groundwater sampling locations are due to the use of low level LOR (i.e. using the more sensitive test). As such, in most cases PFAS was found to be present when previously (using the standard LOR), the PFAS was not detected. - Some of the first-time detections (namely MW144, MW262S, MW536, MW537 and MW538) were not due to the use of low level LOR (i.e. the concentrations exceeded the standard LOR). It is noted that these locations (MW144, MW262S, MW536, MW537 and MW538) are ad hoc selected for sampling during the annual sampling event and had not been sampled since 2017. - Several samples were requested to be reanalysed by the primary laboratory to verify the detections. The reanalysis confirmed the detections and the laboratory did not identify any procedural or analytical errors pertaining to their analysis. Further details are provided in the data validation assessment in Appendix D. - No changes to the monitoring frequency is considered to be warranted following a review of these exceedances for the OMP monitoring locations.
	PFOS	- MW122 (0.002 µg/L) - MW139 (0.002 µg/L) - MW142D (0.004 µg/L) - MW142S (0.007 µg/L) - MW144 (0.069 µg/L) - MW255S (0.004 µg/L) - MW260D (0.002 µg/L) - MW262S (0.033 µg/L) - MW264D (0.005-0.008 µg/L) - MW266S (0.005 µg/L) - MW536 (0.038 µg/L) - MW537 (0.012 µg/L) - MW538 (0.235 µg/L) - POT365 (0.002 µg/L)	
		- MW139 (0.002 µg/L) - MW142D (0.004 µg/L) - MW142S (0.007 µg/L) - MW144 (0.069 µg/L) - MW255S (0.004 µg/L) - MW260D (0.002 µg/L) - MW262S (0.033 µg/L) - MW264D (0.005-0.008 µg/L) - MW266S (0.005 µg/L) - MW536 (0.038 µg/L) - MW537 (0.012 µg/L) - MW538 (0.235 µg/L) - POT365 (0.002 µg/L)	

Trigger Type	Analyte	Triggers in Annual Sampling Event Data Location (Concentration)	Responses
	PFHxS	- MW107D (0.007 µg/L) - MW118 (0.004 µg/L) - MW139 (0.002 µg/L) - MW144 (0.017 µg/L) - MW163 (0.006-0.007 µg/L) - MW255S (0.002 µg/L) - MW262S (0.016 µg/L) - MW264D (0.002 µg/L) - MW278S (0.002 µg/L) - MW536 (0.014 µg/L) - MW537 (0.011 µg/L) - MW538 (0.195 µg/L) - MW842 (0.003 µg/L)	
	PFOS+ PFHxS	- MW118 (0.004 µg/L) - MW139 (0.004 µg/L) - MW142D (0.004 µg/L) - MW142S (0.007 µg/L) - MW144 (0.086 µg/L) - MW255S (0.006 µg/L) - MW262S (0.049 µg/L) - MW264D (0.005-0.01 µg/L) - MW266S (0.005 µg/L) - MW536 (0.052 µg/L) - MW537 (0.023 µg/L) - MW538 (0.43 µg/L) - POT365 (0.002 µg/L)	
	PFBS	- MW122 (0.002 µg/L) - MW163 (0.003 µg/L) - MW230S (0.007 µg/L) - MW260D (0.007 µg/L) - MW538 (0.052 µg/L)	

Trigger Type	Analyte	Triggers in Annual Sampling Event Data Location (Concentration)	Responses
First-time exceedance of the drinking water guideline (revised in June 2025 by NHMRC) in groundwater. PFOA: 0.2 µg/L PFOS: 0.008 µg/L PFHxS: 0.03 µg/L PFBS: 1 µg/L <i>Note: These triggers are highlighted in yellow in the result figure, Figure F6 in Appendix A, and in the analytical table, Table T8 in Appendix B.</i>	PFOA	Nil	- The first-time exceedances at MW128S, MW144, MW262S, MW536, MW537 and MW538 were not due to the use of low level LOR (i.e. the concentrations exceeded the standard LOR). It is noted that majority of these locations (namely MW144, MW262S, MW536, MW537 and MW538) are ad hoc, selected for sampling during the annual sampling event and had not been sampled since 2017. - Several samples (including MW262S and MW538) were requested to be reanalysed by the primary laboratory to verify the exceedances. The reanalysis confirmed the exceedances and the laboratory did not identify any procedural or analytical errors pertaining to their analysis. Further details are provided in the data validation assessment in Appendix D. - Additionally, given MW144, MW262S, MW536, MW537 and MW538 were ad hoc sampling locations not sampled since 2017, rolling averages were not calculated. - The rolling average over a three year period (2023-2025) for PFHxS results from MW128S (0.01 µg/L) remain below the adopted drinking water guidelines. - No changes to the monitoring frequency are considered to be warranted upon review of these exceedances for the OMP monitoring locations.
	PFOS	- MW144 (0.069 µg/L) - MW262S (0.033 µg/L) - MW536 (0.038 µg/L) - MW537 (0.012 µg/L) - MW538 (0.235 µg/L)	
	PFHxS	- MW128S (0.038 µg/L) - MW538 (0.195 µg/L)	
	PFBS	Nil	
First-time exceedance of the recreational water guideline (HEPA, 2025) in surface water: PFOA: 10 µg/L PFOS+PFHxS: 2 µg/L	PFOA	Nil	Nil
	PFOS+PFHxS	Nil	Nil
First-time exceedance in groundwater of the groundwater exposure point	PFOS+PFHxS	- MW144 (0.086 µg/L) [Risk Zone C] - MW231S (0.1 µg/L) [Risk Zone C]	Majority of these locations (namely MW144, MW536, and MW538) are ad hoc, selected for sampling during the

Trigger Type	Analyte	Triggers in Annual Sampling Event Data Location (Concentration)	Responses
concentration (EPC) used in the 2017 HHRA for the relevant Risk Zone: Risk Zone A PFOS+PFHxS: 190.3 µg/L Risk Zone B PFOS+PFHxS: 5.67 µg/L Risk Zone C & D PFOS+PFHxS: 0.05 µg/L <i>Note: These triggers are highlighted in green in the result figure, Figure F6 in Appendix A, and in the analytical table, Table T8 in Appendix B.</i>		- MW536 (0.052 µg/L) [Risk Zone C] - MW538 (0.43 µg/L) [Risk Zone C]	annual sampling event and had not been sampled since 2017. - Several samples (including for MW231S and MW538) were requested to be reanalysed by the primary laboratory to verify the exceedances. The reanalysis confirmed the exceedances and the laboratory did not identify any procedural or analytical errors pertaining to their analysis. Further details are provided in the data validation assessment in Appendix D. - All four groundwater sampling locations (MW144, MW231S, MW536, and MW538) are on private properties within the Secondary Management Zone. There is no change to the risk profile given that the NSW Governments precautionary advice continues to apply to these locations. Additionally, the drinking water pathway is considered to be incomplete given that groundwater is either not used at the property at all (for the property where MW144, MW536 and MW538 are located) or groundwater used at the property is not hydraulically connected to the impacted well (for MW231S).
First-time exceedance in surface water of the surface water EPC for 95 th percentile used in the 2017 HHRA:	PFOS	Nil	Nil
Marine Water PFOS: 1.78 µg/L, PFHxS: 1.48 µg/L Region 1 PFOS: 5.035 µg/L, PFHxS: 1.666 µg/L Region 2 PFOS: 1.47 µg/L, PFHxS: 1.009 µg/L Region 3 PFOS: 7.743 µg/L, PFHxS: 6.773 µg/L	PFHxS	Nil	Nil

Trigger Type	Analyte	Triggers in Annual Sampling Event Data Location (Concentration)	Responses
Sediment PFAS (i.e. Sum of PFAS) concentration increase in two consecutive sampling events.	Sum of PFAS	Nil (where increases in two consecutive sampling events, results were below historical maximums)	Nil

6.0 Upcoming Sampling Event and Reporting

6.1 Upcoming Sampling Events

The next OMP sampling event is scheduled for Q3 2025.

6.2 Upcoming Ongoing Monitoring Report

The next OMR is scheduled to be delivered in Q1 of 2026, covering data collected within the 12-month sampling period between January 2025 and December 2025.

Calibration Certificates

Certificate of Service and Calibration
Interface Meter
Heron H.Oil

Company Name	WAM Scientific
Office Address	26 Bungarra Crescent, Chipping Norton NSW 2170
Phone Number	+61 405 241 484
Contact Name	
Instrument	Heron H.Oil Interface Meter (30m)
Serial Number	01-09087
Client Name	(AECOM)
Project Number	60739111-1.10.1

Instrument Check			
Item	Test	Test Passed	Comments
9V Battery	Klein Tools MM300 Multimeter	✓	Battery voltage reading above 7.9V
Battery Box	Check	✓	No damage
Face and Back Plates	Check	✓	No damage
Thumb Screws	Check	✓	Rubber ends intact
Tape Hangar/Protector	Check	✓	No damage
On/Off Button	Operation	✓	Button is functional
Buzzer	Operation	✓	Intermittent tone in H ₂ O, solid tone in product
LED Signal Light	Operation	✓	LED light functional – green and red
Probe	Operation/Check	✓	Decontaminated, cleaned and tested
Tape	Condition/Check	✓	Decontaminated and cleaned, no damage
Connection	Check	✓	Probe and link connected correctly and tightly
PCB	Operation	✓	Unit is fully functional
Electronics Panel	Orientation	✓	Correctly aligned

Instrument Readings		
Product	Buzzer	LED Light
H ₂ O	Intermittent	Blinking – Red
Petroleum	Solid	Steady – Red

Declaration
WAM Scientific certifies that the above instrument was successfully tested according to manufacturer's standards and all necessary checks were conducted to ensure the instrument was fully operational prior to dispatch. The interface meter was decontaminated, cleaned and tested with a mixture of tap water and petrol, shielded from ambient light.

Instrument Check

Item	Test	Test Passed	Comments
2 x Alkaline C-size Batteries	Klein Tools MM300 Multimeter	✓	Both batteries reading above 2.9V
Battery Saver Function	Operation	✓	Automatically turns off after 60 minutes if idle
Unit Display	Operation	✓	Screen visible, no damage
Keypad	Operation	✓	Responsive, no damage
Connection Port and Cable	Condition/Check	✓	Clean, no damage
Monitor Housing	Condition/Check	✓	No damage
Firmware	Version	✓	4.0.0
pH Probe	Condition/Calibration	✓	Calibrated and conforms to manufacturer's specs
pH millivolts for pH 7.00	Calibration	✓	pH 7.00 calibration range between 0 mV $\pm$ 50 mV
pH millivolts for pH 4.00	Calibration	✓	pH 4 mV range +165 to +180 from 7 buffer mV value
pH slope	Calibration	✓	Range between 55 to 60 mV/pH (ideal value 59 mV)
Response time < 90 seconds	Calibration	✓	Responds to correct value within 90 seconds
ORP Probe	Condition/Calibration	✓	Calibrated and conforms to manufacturer's specs
ORP Reading	Calibration	✓	Within $\pm$ 80 mV of reference Zobell Reading
Response time < 90 seconds	Calibration	✓	Responds to correct value within 90 seconds
Conductivity/Temp Probe	Condition/Calibration	✓	Calibrated and conforms to manufacturer's specs
Conductivity Cell	Calibration	✓	Conductivity cell constant 5.0 $\pm$ 1.0 in GLP file
Clean Sensor Readings	Calibration	✓	Clean sensor reads less than 3 uS/cm in dry air
Dissolved Oxygen Probe	Condition/Calibration	✓	Calibrated and conforms to manufacturer's specs
DO Cap	Condition/Calibration	✓	1.25 mil PE membrane (yellow membrane)
DO Sensor in Use	Condition	✓	Polarographic DO sensor
DO Sensor Value	Calibration	✓	(min 4.31 uA - max 8.00 uA) Avg 6.15 uA

Instrument Readings

Parameter	Standard Used	Reference No.	Calibration Value	Observed	Actual	Units
Temperature	Centre 370 Thermometer	Room Temp.	23.8	24.4	23.8	°C
pH	pH 4.00	417183	4.01	4.04	4.01	pH
pH	pH 7.00	419528	7.00	7.05	7.00	pH
Conductivity	2760 μ S/cm at 25°C	399819	2760	2823	2760	μ S/cm
ORP (Ref. check only)	Zobell A & B	420448/418958	231.6	230.8	231.6	mV
Zero Dissolved O ₂	NaSO ₃ in Distilled H ₂ O	426184	0.0	0.2	0.0	%
100% Dissolved O ₂	100% Air Saturated H ₂ O	Fresh Air	100.0	98.0	100.0	%

Declaration

WAM Scientific certifies that the above instrument was successfully tested according to manufacturer's standards and all necessary checks were conducted to ensure the instrument was fully operational prior to dispatch. The calibration data supplied was obtained in accordance with manufacturer's specifications using solutions of known values.

Data Validation

DATA VALIDATION REPORT

Project number:	60739111	Validation by:	BY	Date:	23/06/2025
Client:	Department of Defence	Data verified by:	ST	Date:	24/06/2025
Site:	RAAF Base Williamtown				
Matrix type:	Groundwater, Bore water, Surface water and Sediment				
Primary samples:	133 Groundwater samples, 6 bore water samples, 25 Surface water samples and 26 Sediment samples				
Laboratory:	Primary: ALS, Secondary: Envirolab				
Lab reference:	ALS: ES2509680, ES2509681, ES2509682, ES2510538, ES2510539, ES2510540, ES2510542, ES2511271, ES2511273, ES2511275, ES2511276, ES2511277, ES2511279, ES2511281, ES2511284, ES2511286, ES2511293, ES2511299, ES2515729, ES2513902, ES2513709, ES2515730, ES2515731, ES2515837, ES2517305, and ES2517306 Reanalysis: ES2511276, ES2511279, ES2519162, and ES2519163 Envirolab: 378731-A and 381865				
Key Issues:	No QA/QC issues were identified in the field or laboratory datasets that could have a material implication to decision-making on the project.				
Field Quality Assurance and Quality Control					
Field DQOs and DQIs	The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2025).				
Sampling personnel	The main sampling event was conducted between 01/04/2025 and 17/04/2025, with additional sampling undertaken on 26/05/2025, 27/05/2025 and 10/06/2025. The sampling was conducted by suitably qualified and experienced AECOM Environmental Scientists and Engineers.				
Sampling Methodology	All water and sediment samples were collected in accordance with the methodology outlined in the SAQP (AECOM, 2025). After each sample was collected, reusable equipment was decontaminated using Liquinox and potable water, and the consumables (nitrile gloves and HydraSleeve™ material) were disposed of in waste bins.				
Chain of Custody (COC)	All samples collected were reported on the Chain of Custody documents (COC) and subsequent email amendments and analysed for requested analytes.				
Rinsate Blank	Rinsate blank samples were collected at a frequency of 1 per day of sampling per sampling team where equipment was re-used and decontaminated between sample points. Rinsate blank samples were either collected from the final rinse of the interface probe or the trowel, using laboratory-supplied de-ionised water. A total of 13 rinsate blank samples were collected.				
Frequency of field QC	Field duplicates (intra-laboratory duplicates) were collected at/above the required frequency of 1 in 10 primary samples (10%) for water samples and 1 in 20 primary samples (5%) for sediment samples. Overall, 19 field duplicates and 18 field triplicates were collected for 192 primary samples, these comprised: 17 water field duplicates and 17 water field triplicates, which were collected for 164 primary water samples (10.4 % frequency for both) 2 sediment field duplicates and 2 sediment field triplicates, which were collected for 26 primary sediment samples in total (7.7% frequency for both).				
Handling and preservation	All samples were received at the primary laboratory in appropriate containers with temperatures between 0.1°C to 3.6°C (with ice present), within the recommended temperature range (<6°C). Samples received at the secondary laboratory arrived in appropriate containers within the recommended range (<6°C) with the exception of 378731-A. The temperature for 378731-A was recorded as 6.3°C (with ice present).				
Calibration of equipment	Measurements of water geochemical parameters were undertaken using YSI Professional Plus water quality meters, which were calibrated by the supplier prior to use, in accordance with the manufacturer's instructions and bump tested daily by the field personnel. Measurements of depth to groundwater were undertaken using interface probes, which were serviced by the supplier prior to use. All equipment calibration and service certificates are presented in Appendix C.				

DATA VALIDATION REPORT						
Laboratory QA/QC						
Laboratory DQOs and DQIs	The data quality objectives (DQOs) and data quality indicators (DQIs) adopted for these works are presented in the SAQP (AECOM, 2025).					
Tests requested/reported	All samples were analysed for per- and polyfluoroalkyl substances (PFAS) extended suite, at the standard level of detection. All sample requests for analysis are reported on the Chain of Custody (COC) and subsequent email amendments.					
Holding time compliance	All samples were extracted and analysed by the laboratory within the recommended holding times.					
Laboratory accreditation	The primary laboratory analysis was conducted by ALS Environmental Pty Ltd (Sydney) a National Association of Testing Authorities (NATA) accredited laboratory (Accreditation No. 825). The secondary samples were analysed at Envirolab Services, also a NATA accredited laboratory (accreditation number 2901).					
Frequency of laboratory QC	The primary laboratory ALS reported a sufficient frequency of quality control samples to assess whether the results have been reported with acceptable accuracy and precision, with the exception of the following: ES2509682: Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS – 9.59%					
Method Blank	All method blank concentrations were reported <LOR (limit of reporting) for the analytes tested, meeting the project requirements. This is presented in the Quality Control Reports for both laboratories.					
Laboratory duplicate RPDs	The reported Relative Percentage Differences (RPDs) for laboratory duplicates were within laboratory control limits. The RPDs for laboratory duplicates are presented in the Quality Control Reports for both laboratories.					
LCS recovery	Laboratory control spike (LCS) recoveries were reported within control limits. This is presented in the Quality Control Reports for both laboratories.					
Matrix spike recovery	Matrix spike (MS) recoveries were reported within control limits, with the exception of matrix spike recoveries that were not determined for the following: - ES2509682: Perfluorohexane sulfonic acid (PFHxS), 0908_SW059_250402 - ES2509682: Perfluorooctane sulfonic acid (PFOS), 0908_MW109D_250404 - ES2509682: Perfluorooctane sulfonic acid (PFOS), 0908_SW059_250402 - ES2510538: Perfluorooctane sulfonic acid (PFOS), 0908_SD600_250410 - ES2510539: Perfluorooctane sulfonic acid (PFOS), 0908_QC110_250407 - ES2510540: Perfluorooctane sulfonic acid (PFOS), Anonymous These non-determinations were due to background levels being greater than or equal to four times spike levels, which do not reflect method bias or affect data interpretation.					
Surrogate spike recovery	The reported surrogate spike recoveries were within laboratory control limits.					
QA/QC Data Evaluation						
Comparison of Field Observations and Laboratory Results	No anomalies between field observations and analytical results were noted.					
Anomalous data	Re-analysis was conducted for samples collected at MW231S, MW262S, MW538, and SD326, following the initial reporting of PFAS concentrations outside of historical ranges. The re-analysis (reported in batches ES2511276, ES2511279, ES2519162, and ES2519163) broadly confirmed the originally reported results (see table below). Given the laboratory did not identify any procedural or analytical errors pertaining to their analysis, the most conservative, originally reported concentrations have been retained and used in the assessment.					
	Location Code	Analysis	PFOA Result	PFOS Result	PFHxS Result	PFOS+PFHxS Result
	MW231S	Original	<0.01	0.08	0.02	0.1
		Re-analysis	<0.01	0.07	0.02	0.09
	SD326	Original	0.0056	0.164	0.0056	0.17
		Re-analysis	0.0004	0.0357	0.0011	0.0368

DATA VALIDATION REPORT						
	MW262S	Original	0.002	0.032	0.019	0.051
		Re-analysis	<0.002	0.033	0.016	0.049
	MW538	Original	0.011	0.234	0.202	0.436
		Re-analysis	0.011	0.235	0.195	0.430
Data transcription	A check of the laboratory results identified no anomalies within the electronic data, the laboratory reports, and the tables generated by AECOM.					
Limits of reporting	The laboratory LORs were sufficiently low to enable assessment against adopted guideline criteria, with the following exceptions: - PFAS NEMP Freshwater 99% species protection (HEPA, 2025) for PFOS values - Australian Drinking Water Guidelines (NHMRC, 2025) for PFOS value, where analysed at the standard LOR.					
Rinsate Blank sample results	The concentrations of PFAS in the Rinsate Blank samples (Table D3) were below the LOR, indicating decontamination procedures were adequate.					
RPDs for Field Duplicates / Triplicates	RPDs for field duplicates (intra-laboratory duplicates) and triplicates (inter-laboratory duplicates), where calculable were reported within acceptable limits ($\leq 30\%$, or $\leq 50\%$ for results 10-20 x LOR, or No Limit for results <10 x LOR) (see Table D1 and Table D2), with the exception of: Sediment (Table D1) - Individual PFAS compound RPDs for intra-lab duplicates ranged between 23% and 52%. - Individual PFAS compound RPDs for inter-lab duplicates which ranged between 43% and 62%. RPD exceedances were reported in two duplicate pairs (for SD081 and SD011) for sediment matrices. The elevated RPD for sediment is likely to be attributed to the heterogeneous nature of the sediment sampled and given that the concentrations are within the same order of magnitude it is therefore considered acceptable. Note that when sampling, care was taken to ensure potential heterogeneity was reduced, by dividing the sample collected between primary, inter, and intra-laboratory jars. Water (Table D2) - Individual PFAS compound RPDs for intra-lab duplicates ranged between 22% and 100%. - Individual PFAS compound RPDs for inter-lab duplicates which ranged between 43% and 100%. RPD exceedances were reported in 6 duplicate pair samples (for MW132, MW161D, MW163, MW344, MW441 and MW829) for water matrices. However, given that the concentrations between the primary and duplicate (inter and intra duplicate) samples were within same order of magnitude, the RPD exceedances are considered acceptable.					
Overall Assessment						
Data validation procedure employed in the assessment of the field and laboratory QA/QC data indicated that the reported analytical results are representative of the sample locations and that the overall quality of the analytical data produced is acceptably reliable for the purpose of this report.

Issue Date : **14-Apr-2025 12:33**

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
[REDACTED]	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
	LCMS Coordinator	Sydney Inorganics, Smithfield, NSW
	LCMS Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per USEPA 1633 limits where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Sampler : [REDACTED]

Site : WLM Soil

Quote number : ES24AECOMAU0012 V3

No. of samples received : 19

No. of samples analysed : 19

Laboratory : Environmental Division Sydney

Contact : [REDACTED]

Address : 277-289 Woodpark Road Smithfield NSW Australia 2164

Telephone : +61 2 8784 8555

Date Samples Received : 04-Apr-2025

Date Analysis Commenced : 08-Apr-2025

Issue Date : 14-Apr-2025

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
[REDACTED]	Organic Coordinator	Sydney Inorganics, Smithfield, NSW
[REDACTED]	LCMS Coordinator	Sydney Inorganics, Smithfield, NSW
[REDACTED]	LCMS Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
 LOR = Limit of reporting
 RPD = Relative Percentage Difference
 # = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Sub-Matrix: **SOIL**

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Contact	: [REDACTED]	Telephone	: +61 2 8784 8555
Project	: NSW_0908_PFASOMP_25	Date Samples Received	: 04-Apr-2025
Site	: WLM Soil	Issue Date	: 14-Apr-2025
Sampler	: [REDACTED]	No. of samples received	: 19
Order number	: 60739111_1.10.1	No. of samples analysed	: 19

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- **NO** Matrix Spike outliers occur.
- For all regular sample matrices, where applicable to the methodology, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- **NO** Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- **NO** Quality Control Sample Frequency Outliers exist.

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Evaluation: ✖ = Holding time breach ; ✔ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL** Evaluation: ✖ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification .

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification

Matrix Spikes (MS)							
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	19	5.26	5.00	✓	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. A portion of homogenised sample is extracted along with isotope dilution standards (where commercially available) in a solution of ammonium acetate in acetonitrile/methanol. Where relevant, interferences from co-extracted organics are removed using dispersive clean-up media (dSPE). A portion of extract is combined with an equal volume of reagent water and filtered for instrumental analysis.
Preparation Methods	Method	Matrix	Method Descriptions
QuEChERS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.

General Comments

- This report contains the following information:
 - Sample Container(s)/Preservation Non-Compliances
 - Summary of Sample(s) and Requested Analysis
 - Proactive Holding Time Report
 - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- No sample container / preservation non-compliance exists.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
[REDACTED]	Organic Chemist	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
 LOR = Limit of reporting
 RPD = Relative Percentage Difference
 # = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Sampler	: [REDACTED]	No. of samples received	: 1
Order number	: 60739111_1.10.1	No. of samples analysed	: 1

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- **NO** Matrix Spike outliers occur.
- For all regular sample matrices, where applicable to the methodology, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- **NO** Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- **NO** Quality Control Sample Frequency Outliers exist.

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: ✖ = Holding time breach ; ✔ = Within holding time.

Method	Sample Date	Extraction / Preparation			Analysis		
Container / Client Sample ID(s)		Date extracted	Due for extraction	Evaluation	Date analysed	Due for analysis	Evaluation

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: ✖ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

Quality Control Sample Type		Count		Rate (%)			Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)							
Per- and Polyfluoroalkyl Substances (PFAS by LCMSMS)	EP231X-LL	1	8	12.50	10.00	✔	NEPM 2013 B3 & ALS QC Standard
Laboratory Control Samples (LCS)							
Per- and Polyfluoroalkyl Substances (PFAS by LCMSMS)	EP231X-LL	1	8	12.50	5.00	✔	NEPM 2013 B3 & ALS QC Standard
Method Blanks (MB)							
Per- and Polyfluoroalkyl Substances (PFAS by LCMSMS)	EP231X-LL	1	8	12.50	5.00	✔	NEPM 2013 B3 & ALS QC Standard
Matrix Spikes (MS)							
Per- and Polyfluoroalkyl Substances (PFAS by LCMSMS)	EP231X-LL	1	8	12.50	5.00	✔	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS by LCMSMS)	EP231X-LL	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction (SPE) followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. Isotope dilution standards (where commercially available) and surrogates are added to the sample container. The entire contents are transferred to a weak anion exchange (WAX) solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Data quality objectives for internal standard recoveries are based on US EPA method 1633.
Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
 - Sample Container(s)/Preservation Non-Compliances
 - Summary of Sample(s) and Requested Analysis
 - Proactive Holding Time Report
 - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- No sample container / preservation non-compliance exists.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.

No. of samples analysed	: 91		

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
[REDACTED]	Organic Chemist	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key : Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot

CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

RPD = Relative Percentage Difference

= Indicates failed QC

* = The final LOR has been raised due to dilution or other sample specific cause; adjusted LOR is shown in brackets. The duplicate ranges for Acceptable RPD% are applied to the final LOR where applicable.

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

QA/QC Compliance Assessment to assist with Quality Review

Work Order : ES2509682

Page : 1 of 14

Client : AECOM AUSTRALIA PTY LTD
Contact :
Project : NSW_0908_PFASOMP_25
Site : WLM SW and GW
Sampler :
Order number : 60739111_1.10.1

Laboratory : Environmental Division Sydney
Telephone : +61 2 8784 8555
Date Samples Received : 04-Apr-2025
Issue Date : 14-Apr-2025
No. of samples received : 91
No. of samples analysed : 91

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, where applicable to the methodology, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- **NO** Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- Quality Control Sample Frequency Outliers exist - please see following pages for full details.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **WATER**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	ES2509682--062	0908_SW059_250402	Perfluorohexane sulfonic acid (PFHxS)	355-46-4	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
EP231A: Perfluoroalkyl Sulfonic Acids	ES2509682--043	0908_MW109D_250404	Perfluorooctane sulfonic acid (PFOS)	1763-23-1	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.
EP231A: Perfluoroalkyl Sulfonic Acids	ES2509682--062	0908_SW059_250402	Perfluorooctane sulfonic acid (PFOS)	1763-23-1	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.

Outliers : Frequency of Quality Control Samples

Matrix: **WATER**

Quality Control Sample Type		Count		Rate (%)		Quality Control Specification
Analytical Methods	Method	QC	Regular	Actual	Expected	
Laboratory Duplicates (DUP)						
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	7	73	9.59	10.00	NEPM 2013 B3 & ALS QC Standard

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **WATER**

Evaluation: ✖ = Holding time breach ; ✔ = Within holding time.

Method	Sample Date	Extraction / Preparation			Analysis

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **WATER**

Evaluation: ✖ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction (SPE) followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. Isotope dilution standards (where commercially available) and surrogates are added to the sample container. The entire contents are transferred to a weak anion exchange (WAX) solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Data quality objectives for internal standard recoveries are based on US EPA method 1633.
Per- and Polyfluoroalkyl Substances (PFAS by LCMSMS	EP231X-LL	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction (SPE) followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. Isotope dilution standards (where commercially available) and surrogates are added to the sample container. The entire contents are transferred to a weak anion exchange (WAX) solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Data quality objectives for internal standard recoveries are based on US EPA method 1633.
Preparation Methods	Method	Matrix	Method Descriptions
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
 - Sample Container(s)/Preservation Non-Compliances
 - Summary of Sample(s) and Requested Analysis
 - Proactive Holding Time Report
 - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- **09/04/2025: This is an updated SRN reflecting amendments to Sample ES2509682-030 Date and Time to 03/04/2025 12:57 PM and ES2509682-085 ID to 0908_QC105_250403.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- No sample container / preservation non-compliance exists.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
[REDACTED]	Organic Chemist	Sydney Organics, Smithfield, NSW
[REDACTED]	LCMS Coordinator	Sydney Inorganics, Smithfield, NSW
[REDACTED]	LCMS Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231: Stable isotope enriched internal standards are added to samples prior to extraction. Target compounds have a direct analogous internal standard with the exception of PFPeS, PFHpA, PFDS, PFTrDA and 10:2 FTS. These compounds use an internal standard that is chemically related and has a retention time close to that of the target compound. The DQO for internal standard response is 50-150% of that established at initial calibration or as per USEPA 1633 limits where listed. PFOS is quantified using a certified, traceable standard consisting of linear and branched PFOS isomers. These practices are in line with recommendations in the National Environmental Management Plan for PFAS and also conform to QSM 5.4 (US DoD) requirements.

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Quality Control Report contains the following information:

- Laboratory Duplicate (DUP) Report; Relative Percentage Difference (RPD) and Acceptance Limits
- Method Blank (MB) and Laboratory Control Spike (LCS) Report; Recovery and Acceptance Limits
- Matrix Spike (MS) Report; Recovery and Acceptance Limits

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Signatories	Position	Accreditation Category
[REDACTED]	Organic Chemist	Sydney Organics, Smithfield, NSW
[REDACTED]	LCMS Coordinator	Sydney Inorganics, Smithfield, NSW
[REDACTED]	LCMS Coordinator	Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis. Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

Key :
 Anonymous = Refers to samples which are not specifically part of this work order but formed part of the QC process lot
 CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.
 LOR = Limit of reporting
 RPD = Relative Percentage Difference
 # = Indicates failed QC

Laboratory Duplicate (DUP) Report

The quality control term Laboratory Duplicate refers to a randomly selected intralaboratory split. Laboratory duplicates provide information regarding method precision and sample heterogeneity. The permitted ranges for the Relative Percent Deviation (RPD) of Laboratory Duplicates are specified in ALS Method QWI-EN/38 and are dependent on the magnitude of results in comparison to the level of reporting: Result < 10 times LOR: No Limit; Result between 10 and 20 times LOR: 0% - 50%; Result > 20 times LOR: 0% - 20%.

Method Blank (MB) and Laboratory Control Sample (LCS) Report

The quality control term Method / Laboratory Blank refers to an analyte free matrix to which all reagents are added in the same volumes or proportions as used in standard sample preparation. The purpose of this QC parameter is to monitor potential laboratory contamination. The quality control term Laboratory Control Sample (LCS) refers to a certified reference material, or a known interference free matrix spiked with target analytes. The purpose of this QC parameter is to monitor method precision and accuracy independent of sample matrix. Dynamic Recovery Limits are based on statistical evaluation of processed LCS.

Matrix Spike (MS) Report

The quality control term Matrix Spike (MS) refers to an intralaboratory split sample spiked with a representative set of target analytes. The purpose of this QC parameter is to monitor potential matrix effects on analyte recoveries. Static Recovery Limits as per laboratory Data Quality Objectives (DQOs). Ideal recovery ranges stated may be waived in the event of sample matrix interference.

Order number	: 60739111_1.10.1	No. of samples analysed	: 4

This report is automatically generated by the ALS LIMS through interpretation of the ALS Quality Control Report and several Quality Assurance parameters measured by ALS. This automated reporting highlights any non-conformances, facilitates faster and more accurate data validation and is designed to assist internal expert and external Auditor review. Many components of this report contribute to the overall DQO assessment and reporting for guideline compliance.

Brief method summaries and references are also provided to assist in traceability.

Summary of Outliers

Outliers : Quality Control Samples

This report highlights outliers flagged in the Quality Control (QC) Report.

- **NO** Method Blank value outliers occur.
- **NO** Duplicate outliers occur.
- **NO** Laboratory Control outliers occur.
- Matrix Spike outliers exist - please see following pages for full details.
- For all regular sample matrices, where applicable to the methodology, **NO** surrogate recovery outliers occur.

Outliers : Analysis Holding Time Compliance

- **NO** Analysis Holding Time Outliers exist.

Outliers : Frequency of Quality Control Samples

- **NO** Quality Control Sample Frequency Outliers exist.

Outliers : Quality Control Samples

Duplicates, Method Blanks, Laboratory Control Samples and Matrix Spikes

Matrix: **SOIL**

Compound Group Name	Laboratory Sample ID	Client Sample ID	Analyte	CAS Number	Data	Limits	Comment
Matrix Spike (MS) Recoveries							
EP231A: Perfluoroalkyl Sulfonic Acids	ES2510538--001	0908_SD600_250410	Perfluorooctane sulfonic acid (PFOS)	1763-23-1	Not Determined	----	MS recovery not determined, background level greater than or equal to 4x spike level.

Analysis Holding Time Compliance

If samples are identified below as having been analysed or extracted outside of recommended holding times, this should be taken into consideration when interpreting results.

This report summarizes extraction / preparation and analysis times and compares each with ALS recommended holding times (referencing USEPA SW 846, APHA, AS and NEPM) based on the sample container provided. Dates reported represent first date of extraction or analysis and preclude subsequent dilutions and reruns. A listing of breaches (if any) is provided herein.

Holding time for leachate methods (e.g. TCLP) vary according to the analytes reported. Assessment compares the leach date with the shortest analyte holding time for the equivalent soil method. These are: organics 14 days, mercury 28 days & other metals 180 days. A recorded breach does not guarantee a breach for all non-volatile parameters.

Holding times for VOC in soils vary according to analytes of interest. Vinyl Chloride and Styrene holding time is 7 days; others 14 days. A recorded breach does not guarantee a breach for all VOC analytes and should be verified in case the reported breach is a false positive or Vinyl Chloride and Styrene are not key analytes of interest/concern.

Matrix: **SOIL**

Evaluation: ✖ = Holding time breach ; ✔ = Within holding time.

Quality Control Parameter Frequency Compliance

The following report summarises the frequency of laboratory QC samples analysed within the analytical lot(s) in which the submitted sample(s) was(were) processed. Actual rate should be greater than or equal to the expected rate. A listing of breaches is provided in the Summary of Outliers.

Matrix: **SOIL**

Evaluation: ✖ = Quality Control frequency not within specification ; ✔ = Quality Control frequency within specification.

Quality Control Sample Type	Method	Count		Rate (%)			Quality Control Specification
Analytical Methods		QC	Regular	Actual	Expected	Evaluation	
Laboratory Duplicates (DUP)							
Moisture Content	EA055	2	13	15.38	10.00	✔	NEPM 2013 B3 & ALS QC Standard
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	10	10.00	10.00	✔	NEPM 2013 B3 & ALS QC Standard
Laboratory Control Samples (LCS)							
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	1	10	10.00	5.00	✔	NEPM 2013 B3 & ALS QC Standard

Brief Method Summaries

The analytical procedures used by the Environmental Division have been developed from established internationally recognized procedures such as those published by the US EPA, APHA, AS and NEPM. In house developed procedures are employed in the absence of documented standards or by client request. The following report provides brief descriptions of the analytical procedures employed for results reported in the Certificate of Analysis. Sources from which ALS methods have been developed are provided within the Method Descriptions.

Analytical Methods	Method	Matrix	Method Descriptions
Moisture Content	EA055	SOIL	In house: A gravimetric procedure based on weight loss over a 12 hour drying period at 105-110 degrees C. This method is compliant with NEPM Schedule B(3).
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	SOIL	In-house: Analysis of soils by solvent extraction followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. A portion of homogenised sample is extracted along with isotope dilution standards (where commercially available) in a solution of ammonium acetate in acetonitrile/methanol. Where relevant, interferences from co-extracted organics are removed using dispersive clean-up media (dSPE). A portion of extract is combined with an equal volume of reagent water and filtered for instrumental analysis.
Per- and Polyfluoroalkyl Substances (PFAS) by LCMSMS	EP231X	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction (SPE) followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. Isotope dilution standards (where commercially available) and surrogates are added to the sample container. The entire contents are transferred to a weak anion exchange (WAX) solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Data quality objectives for internal standard recoveries are based on US EPA method 1633.
Per- and Polyfluoroalkyl Substances (PFAS by LCMSMS	EP231X-LL	WATER	In-house: Analysis of fresh and saline waters by solid phase extraction (SPE) followed by negative mode LC-ESI-MS/MS using MRM and isotope dilution or internal standard quantitation. Isotope dilution standards (where commercially available) and surrogates are added to the sample container. The entire contents are transferred to a weak anion exchange (WAX) solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Data quality objectives for internal standard recoveries are based on US EPA method 1633.
Preparation Methods	Method	Matrix	Method Descriptions
QuEChERS Extraction of Solids	ORG71	SOIL	In house: Sequential extractions with Acetonitrile/Methanol by shaking. Extraction efficiency aided by the addition of salts under acidic conditions. Where relevant, interferences from co-extracted organics are removed with dispersive clean-up media (dSPE). The extract is either diluted or concentrated and exchanged into the analytical solvent.
Solid Phase Extraction (SPE) for PFAS in water	ORG72	WATER	In-house: Isotopically labelled analogues of target analytes used as internal standards and surrogates are added to the sample container. The entire contents are transferred to a solid phase extraction (SPE) cartridge. The sample container is successively rinsed with aliquots of the elution solvent. The eluted extract is combined with an equal volume of reagent water and a portion is filtered for analysis. Method procedures conform to US DoD QSM 5.3, table B-15 requirements.

General Comments

- This report contains the following information:
 - Sample Container(s)/Preservation Non-Compliances
 - Summary of Sample(s) and Requested Analysis
 - Proactive Holding Time Report
 - Requested Deliverables
- **Please refer to the Proactive Holding Time Report table below which summarises breaches of recommended holding times that have occurred prior to samples/instructions being received at the laboratory. The laboratory will process these samples unless instructions are received from you indicating you do not wish to proceed. The absence of this summary table indicates that all samples have been received within the recommended holding times for the analysis requested.**
- Please direct any queries you have regarding this work order to the above ALS laboratory contact.
- Unless otherwise stated, analytical work for this work order will be conducted at ALS Sydney, NATA accreditation no. 825, site no. 10911.
- Sample Disposal - Aqueous (3 weeks), Solid (2 months ± 1 week) from receipt of samples.
- Please be aware that APHA/NEPM recommends water and soil samples be chilled to less than or equal to 6°C for chemical analysis, and less than or equal to 10°C but unfrozen for Microbiological analysis. Where samples are received above this temperature, it should be taken into consideration when interpreting results. Refer to ALS EnviroMail 85 for ALS recommendations of the best practice for chilling samples after sampling and for maintaining a cool temperature during transit.

Sample Container(s)/Preservation Non-Compliances

All comparisons are made against pretreatment/preservation AS, APHA, USEPA standards.

- No sample container / preservation non-compliance exists.

Summary of Sample(s) and Requested Analysis

Some items described below may be part of a laboratory process necessary for the execution of client requested tasks. Packages may contain additional analyses, such as the determination of moisture content and preparation tasks, that are included in the package.

If no sampling time is provided, the sampling time will default 00:00 on the date of sampling. If no sampling date is provided, the sampling date will be assumed by the laboratory and displayed in brackets without a time component

Accreditation No. 825
Accredited for compliance with
ISO/IEC 17025 - Testing

This report supersedes any previous report(s) with this reference. Results apply to the sample(s) as submitted, unless the sampling was conducted by ALS. This document shall not be reproduced, except in full.

This Certificate of Analysis contains the following information:

- General Comments
- Analytical Results
- Surrogate Control Limits

Additional information pertinent to this report will be found in the following separate attachments: Quality Control Report, QA/QC Compliance Assessment to assist with Quality Review and Sample Receipt Notification.

Signatories

This document has been electronically signed by the authorized signatories below. Electronic signing is carried out in compliance with procedures specified in 21 CFR Part 11.

Sydney Organics, Smithfield, NSW

General Comments

The analytical procedures used by ALS have been developed from established internationally recognised procedures such as those published by the USEPA, APHA, AS and NEPM. In house developed procedures are fully validated and are often at the client request.

Where moisture determination has been performed, results are reported on a dry weight basis.

Where a reported less than (<) result is higher than the LOR, this may be due to primary sample extract/digestate dilution and/or insufficient sample for analysis.

Where the LOR of a reported result differs from standard LOR, this may be due to high moisture content, insufficient sample (reduced weight employed) or matrix interference.

When sampling time information is not provided by the client, sampling dates are shown without a time component. In these instances, the time component has been assumed by the laboratory for processing purposes.

Where a result is required to meet compliance limits the associated uncertainty must be considered. Refer to the ALS Contract for details.

Key : CAS Number = CAS registry number from database maintained by Chemical Abstracts Services. The Chemical Abstracts Service is a division of the American Chemical Society.

LOR = Limit of reporting

^ = This result is computed from individual analyte detections at or above the level of reporting

ø = ALS is not NATA accredited for these tests.

~ = Indicates an estimated value.

- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20mL or 125mL bottles have been tested in accordance with the QSM5.4 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
- EP231X - Per- and Polyfluoroalkyl Substances (PFAS): Samples received in 20ml or 125ml bottles have been tested in accordance with the QSM5.3 compliant, NATA accredited method. 60mL or 250mL bottles have been tested to the legacy QSM 5.1 aligned, NATA accredited method.
